of the hill. At the time of the birth, a spring of warm water from the floor of the cave bubbled up cleansing the child, who was extraordinary in appearance. At age 19, Confucius married a woman of the Chien-kwan family from the state of Sung. They had a son, Lî (*The Carp*) shortly after. According to an inscription, Confucius had at least one other child – a daughter who died at an early age. Confucius first worked as a keeper of public grain stores and public fields. He later served as a public teacher in his early twenties, never refusing a student who desired to learn and eventually becoming teacher to students of the wealthy caste. In 501 BCE he was appointed chief magistrate of the town of Chung-tû, and his authority in the state continued to grow. He died 479 BCE. Some time afterwards public worship of Confucius began, including sacrificial offerings throughout the empire. The primary literary sources for Confucianism include “The Five *Ching*” and “The Four *Shu*.” The Five *Ching* (“textile” connoting regularity and constancy) are thought to have been used by Confucius for study. The oldest text, the *Yi*, contains a system of symbols used to determine cosmological and philosophical order in what is perceived to be chance events. The *Shih* (ca. 1000 BCE?) contains 305 poems of folk songs, festive songs, hymns, and eulogies. The *Lî Chî* dates possibly to 300 BCE and contains social forms and rites of the Zhou Dynasty (1122–256 BCE). The *Shû* contains the history of past Chinese heroes and dynasties. Of its 58 chapters 33 are thought to be authentic, dating to the sixth century BCE. Instruction in Confucianism mostly occurred through use of *The Four Books*, which became the core curriculum for the civil service examination in the Ming Dynasty (1368–1644 CE) and Qing Dynasty (1644–1911 CE). *The Four Books* is an abbreviation for *The Books of the Four Philosophers*. The *Tâ Hsio* or *Great Learning* is attributed to T'ā Shān, a disciple of Confucius. Containing reflections on the teachings of Confucius by some of his followers, it represents the first step for learners and aims “to illustrate illustrious virtue, to renovate the people, and rest in the highest excellence.” (1) Knowing this place of

rest may enable a “calm unperturbedness” and a tranquil repose. (2) Issuing chapters expand upon the aim for virtue through the comments of Tsāng. One is to allow no self-deception (VI.1), make thoughts sincere (VI.4), and cultivate the mind, thus not being under the influence of the passions which leads to incorrect conduct (VII.1). In matters of governing, the regulation and well-being of the royal family has central place: “From the loving example of one family a whole State becomes loving” (IX.3). Similarly, when the sovereign shows compassion toward the young and helpless, “the people do the same” (X.1). The *Lun Yü* or “*Digested Conversations (Confucian Analects)*” consists of the sayings of Confucius compiled some time after his death. It gives instruction and guidance on how to be the “superior” person (II.2). One who loves virtue rather than beauty, serves his parents and his prince, and speaks sincerely with his friends is one who shows learning (I.VII). He is one who in wanting to enlarge himself seeks also to enlarge others (VI.XXVIII). He requires much of himself, and little from others, and so avoids resentment (XV.XIV). As a youth one should be filial in the home and respectful toward elders outside of the home. He should be earnest and truthful, overflowing in love and “cultivating the friendship of the good” (I.VI). Of the manner of governing – a subject often addressed – the “Master” says: “When a country is well-governed, poverty and mean conditions are things to be ashamed of. When a country is ill-governed, riches and honor are things to be ashamed of” (VIII.VIII). The *Chung Lung*, or *Doctrine of the Mean*, is attributed to K’ung Chî, the grandson of Confucius. Not unlike the *Great Learning*, the *Doctrine of the Mean* has a primary focus, which is the “path” called “instruction.” It is never to be left for an instant (I.1–2). Attention to the path yields the states of equilibrium and harmony, and in its furthest reaches, it contains secrets unattainable even by sages (XII.2). It is never far from a person, and the practice of reciprocity – “What you do not like when done to yourself, do not do to others” – is evidence of being near the path (XIII.3). One who is superior embraces this

course; one who is mean lives contrary to it (II.1). One who is superior “stands firm in his energy,” cultivating a friendly harmony without being weak and standing erect in the middle, without inclining to either side (X.5). The fourth writing consists of the writings of Confucius’ successor, Mencius (372–289 BCE). The book contains dialogues between Mencius and various Chinese kings. Distinct from the concise manner of Confucius’ teachings, Mencius’ discussions are more elaborate and extended. The Four *Shuü*, along with The Five *Ching*, relate the cultivation of heightened consciousness through disciplined and considered practice of detailed and focused instruction. This orientation aims toward the experience of a tranquil, orderly state of being, one which is founded upon the implicit relationship between the individual and the collective. Self-control and sociopolitical regulation are essential means toward a desired harmony, and thus there occurs the emphasis upon the praxis of teachings and values. Confucianism in this way, at least in its beginnings, is not so much a religion as it is a teaching about how to live according to philosophical principles and reflections. As such, it sets forth initially little notion of deity worship. It is based upon life experience and observation of the natural world. In the Four Books the forcefulness of “conscious” existence appears to occur at the expense of the recognition and embrace psyche-soma movements such as *coniunctio*.

Conscience

Kate M. Loewenthal

Department of Psychology, Royal Holloway,
University of London, Egham, Surrey, UK

How has conscience been seen in religious traditions? How has it been understood by psychologists? What do we know about the psychological processes involved in the links between religion and conscience?

Religious Views of Conscience

The divine “still, small voice” (I Kings 19, 12) has often been used to depict conscience, the spiritual inner voice offering and urging the morally and spiritually correct path for the individual. Conscience in traditional Western religion is a given part of human constitution but one that may be drowned by bad habits, temptations, poor upbringing, bad examples, and lack of moral education and direction. Conscience is sometimes depicted as the “good inclination,” arguing with the “evil inclination,” both striving for the attention and obedience of their owner (Shneur Zalman of Liadi 1973/1796). Current writings on religious education are often informed and made complex by current psychological understandings of the nature of conscience, of moral growth, and of philosophical issues (e.g., Astley and Francis 1994).

Psychological Views of Conscience

There have been important psychological contributions to the understanding of conscience. This selective overview will mention the contributions of Freud, Erikson, Frankl, Kohlberg, Gilligan, and Hare. A more detailed discussion of conscience from the perspective of the psychology of religion may be found in Meadow and Kahoe (1984);

recent textbooks and research in this area have given rather limited attention to conscience.

The controversy surrounding Freud's views has masked the force and accuracy of some of his observations. He was one of few twentieth-century psychological writers to give attention to conscience, an important topic otherwise widely overlooked. Freud (1924, 1940) suggested that young children experience specifically sexual feelings toward their opposite-sex parent. The wish to possess the parent is foiled by the knowledge that the parent is already owned and by fear that the same-sex parent will seek jealous retribution on the child. This so-called Oedipal situation is resolved by the child's identification with the same-sex parent. This gains the approval of both parents and enables the child to gain vicarious possession of the opposite-sex parent. Aspects of this theory remain controversial, although few would argue with young children can experience intense need for control, intense attachment to their parents, or that intense positive and negative feelings can be experienced by young children and their parents. Freud's account of girls' development is particularly fraught with difficulty. The key point however is that, however identification with the same-sex parent comes about, there is an internalization of the parent figure which becomes the foundation of the G-d image. Parental attitudes are introjected, forming the basis of the superego, experienced as the conscience. This may have a strongly punitive character, and a distinction is sometimes made between the harsh, introjected superego and the inspiring, internalized ego ideal.

Frankl (1975) trained in Freudian psychoanalysis but developed a very distinctive variety of psychotherapy, sometimes known as existential therapy. In Frankl's view, the overriding motive is the will to meaning. The guide in the search for meaning and purpose is the conscience, of transcendent origin, and the therapist's role is to support the client in their search for meaning, a search which is fundamentally spiritual (Wulff 1997).

Like Frankl, Erikson (1950) was a European-trained psychoanalyst, who moved to the USA and developed very distinctive ideas about the

nature of psychological health and growth. Erikson was probably the most influential twentieth-century psychologist to give attention to virtue. He put forward an elaborate – and plausible – account of psychosocial development as continuing throughout the life-span, with virtues resulting from the successful negotiation of the challenges at different life stages. Potential psychopathology occurs if emerging capacities are not nurtured and supported. Erikson described eight stages in all, and it is during the third stage – from approximately ages 2–5 – that conscience and guilt make their appearance. As the understanding and use of language develop, along with the capability of independent action, the child may experience guilt as a consequence of adult reactions to aggressive and uncontrolled actions. Guilt may become destructive, resulting in inhibition and self-righteousness, or it may impel the child toward worthy ideals, constructive initiative, and purposeful action.

We have seen that both Erikson and Frankl emphasized sense of purpose and focus on ideals as important functions of the healthy conscience. Both Freud and Erikson indicated the psychopathological functioning of the conscience whose development has been instilled too coercively or punitively. Finally, we have seen that Freud and Frankel see a close relationship (or identity) between the conscience and G-d.

We turn now to developmental theories of morality, first considering Kohlberg (1976). Kohlberg traced the development of moral thinking from the stage at which morality is bound by utilitarian considerations (what is good for the self), then by prescribed rules, and then through stages in which social welfare and social justice are the highest considerations, to a stage (probably not widely attained) in which an autonomous, individualized morality is concerned with universal ethical principles. In this developmental scheme, an intrinsic conscience is a feature of the stage involving autonomous morality. Kohlberg suggested that women were less likely than men to attain the higher stages of moral development, being more bound by social welfare considerations. This view attracted a strong response from Gilligan (1982), who suggested

that while men are concerned with justice, which is inflexible and abstract, women's primary ethical standard is care for others, which is flexible and context sensitive. Belensky et al. (1986) emphasized the importance for women of connected knowing, which is nonevaluative, whose motive is to understand another person in order to live together in harmony in spite of differences. It is worth mentioning the view of Hare (1999) who among others held that psychopaths – charming, exploitative, and remorseless – lack conscience. Criminal psychopathy may respond to therapeutic interventions, for example, designed to improve empathy for victims (e.g., Friendship et al. 2003). There are variations in the ways in which conscience and morality are governed, indicating the importance of gender, social factors, and cognitive development.

What, empirically, is known about the relations between conscience, religion, and psychological factors?

It is generally found that religiously identified and religiously affiliated people behave “better” than do others. This is consistent with the possibility that religious identification and affiliation promote knowledge of moral rules and the self-monitoring of behavior in accordance with these rules. Bloom (2012) offers an evolutionary perspective. Religious people are less likely than others to engage in criminal behavior (Baier and Wright 2001) and extramarital sexual behavior and recreational drug use (Mattila et al. 2001; Rostosky et al. 2004). Religious people are more likely than others to engage in charitable activity (Inaba and Loewenthal 2009) and in deliberate moral practice and moral expertise (Rossano 2008). The effects of religion are not always straightforward, for example, the effects of religion may vary with gender (Rostosky et al. 2004) or with style of religiosity (Batson 1976).

The effects of religion on moral behavior are broadly consistent, and we might ask whether this is because religious people have greater knowledge of moral rules, because religious people feel greater shame at the thought of wrongdoing, or religious people feel greater guilt.

Shame is normally defined as the result of social anxiety, the experience of others'

knowledge that one has done wrong and/or is bad. Guilt is individualized moral anxiety, the experience of one's own knowledge that one has done wrong and/or is bad (Freud 1926; Meadow and Kahoe 1984). Work on religion in relation to guilt and shame suggests that guilt may often be higher among the religiously active (Hood 1992). Shame is not higher among the religiously active compared to others (Luyten et al. 1998). Maltby (2005) has shown a complex pattern of relationships between different styles of religiosity and different types of guilt, for example, intrinsic ("sincere") religiosity may be linked to healthy guilt. These findings have been produced in Western, generally Christian, cultures, and we know little as yet about guilt, shame, and religion in other cultural and religious contexts.

This entry has suggested three broad conclusions. One is that we may distinguish between two aspects of conscience: a harsh, introjected superego and an internalized, encouraging and inspiring ego ideal. Second, empirical work broadly supports the view that religion is generally associated with "better," more moral behavior. Third, religion may generally promote guilt but not shame. The psychological processes involved in understanding the relations between religion and conscience deserve closer study, for example, effects in different genders, cultures, and religious groups, the influence of religious role models, and the development of different styles of religiosity and their relations to conscience.

Consciousness

F. X. Charet
Goddard College, Plainfield, VT, USA

Introduction

The term consciousness has acquired several meanings, but it is generally associated with “the experience of awareness” though there is no consensus as to its cause(s) or extension. In the closing decades of the twentieth century, the phenomenon of consciousness attracted a considerable amount of attention from persons working in a variety of areas but especially in the neurosciences and cognitive sciences. While various theories have since been advanced to account for the phenomenon of consciousness, none have gained sufficient support to amount to more than proposals. The shared and seemingly reasonable assertion of the dependency of consciousness on neurophysiological processes has largely held the day though even here there is a range of opinions and some concerns about the limitations of such an assumption. At the very least, there is general agreement about a correlation between the two. In view of the aforementioned, what the precise relationship is between everyday consciousness and

what can broadly be termed religious or transpersonal remains unclear and offers a rich field for future exploration and research.

Historical Background

There is an earlier, cross-cultural, and continuous history of reflecting on consciousness as well as various techniques and practices to bring about its alteration and extension that has been insufficiently explored and evaluated. These are largely to be found in the indigenous, religious, spiritual, and philosophical traditions of the planet.

The earliest indications of such reflections and practices are found in the artifacts of the distant past that are currently being tentatively reconstructed by cognitive archeologists and anthropologists (Lewis-Williams 2004, 2005). The evidence while fragmentary offers a compelling argument for the ubiquitous preoccupation with altered states of consciousness and their function and value in indigenous communities (Hayden 2003). Moreover, overcoming past prejudices and claims of the superiority of one culture over another, there is a growing appreciation that such knowledge may have value beyond the contexts in which it has emerged and have wider applications (Webb 2012).

In larger-scale religious traditions, there are a complex number of developed techniques and spiritual practices that have been taught and recorded and that have direct import for the subject of consciousness and its extension. While all of these are rooted in particular cultural contexts, they, too, as in the cases of yoga and various forms of meditation, have attracted wide attention in both theoretical and practical terms (Eliade 1969; Shear 2006; White 2012). Nor are initiatory and spiritual practices of negligible significance in the history of Western culture (Sluhovshy 2011; Ustinova 2011). While initially overlooked or deemed of secondary relevance, there is a noticeable change in attitude on the part of neuroscientists and others in the field of consciousness studies to include the investigation of such reflections and practices in their work (Goleman and Davidson 2017).

In the modern West, the first systematic and rational examination of consciousness begins with the distinction, commonly associated with Descartes (1596–1650), between the physical and the mental. Cartesian dualism set the agenda for subsequent discussion and debate as to its legitimacy, and this continues until today. Variations of mind/body dualism, psychophysical parallelism, immaterialism, and materialism held sway among philosophers in Europe over the next century. An increasing inclination towards empiricism can be found in thinkers like Locke (1632–1704) who distinguished between outer sense and inner sense, the former having to do with the experience of things and the latter with the experience of the experience of things. Such ideas along with interests in making correlations between, and attempting to localize, mental processes in the brain laid the groundwork for an empirical psychology. Nevertheless, Kant (1724–1804) undercut such optimism by denying the possibility of an empirical psychology on the grounds that while the brain could be systematically studied, mental phenomena were subjective and therefore inaccessible to the scientific method. This distinction between objective and subjective is mirrored in contemporary discussions of the problematic relationship between third-person (scientific) and first-person (subjective) approaches to consciousness and the so-called explanatory gap that is a consequence (Shear 2000; Velmans and Schneider 2007).

Psychological Perspectives

Subsequent developments in the study of human physiology and especially the anatomy of the brain and nervous system led to an increasing emphasis on measuring and correlating physiological and mental processes, the latter increasingly perceived as being dependent on the former. The outcome of this was the founding of a laboratory-based, experimental psychology by Wilhelm Wundt (1832–1920) that William James (1842–1910) well understood but found so abhorrent. James' own contribution was to widen the margins of an increasingly narrow physiologically

based psychology to include the possibilities of a multifaceted approach to the study of consciousness, utilizing a number of methods and inclusive of transpersonal experiences as canvassed in his *The Varieties of Religious Experience* (1902). His ambitious proposal for the exploration of consciousness was not implemented after his death, and with the consolidation of experimental psychology and the emergence of the behavioral school in the following decades, consciousness was effectively removed from being a plausible focus of academic attention and research (Taylor 1996). Largely outside of academic psychology, a number of different but related developments occurred that would have significant consequences for an understanding of consciousness and especially consciousness beyond the margins of everyday experience. This took two forms: the investigation for purposes of treatment of various mental states that were determined to be mildly to severely pathological and the investigation of exceptional mental states that appeared to be nonpathological and of a parapsychological or transpersonal nature.

The first of these is exemplified by the psychoanalytic school associated with Freud (1856–1939) that led to a psychology that interpreted abnormal mental states as indicative of psychological dysfunction and illness and extended this to religious and transpersonal experiences. For the most part, Freud understood consciousness as biologically determined and the consequence of sense perception even if it functioned to mediate between the outer and inner world, the latter being largely unconscious and of a psychosexual nature. Any claims that attempted to legitimize religious belief or a more expansive consciousness of a transpersonal nature were deemed evidence of regression to an earlier psychological state and indications of neurosis or a more serious psychotic condition (Freud 1990). Though, it should be added, Freud and some of his followers were intrigued by such phenomena as telepathy and what they termed more broadly “the occult” (Devereux 1953). In the end, psychoanalysis effectively eclipsed most other interpretive models of the psyche and psychodynamic processes and discouraged any views of

consciousness as extending beyond the perceptual reality of the ego. Like behaviorism, its own ideological limitations prescribed its views on what constituted consciousness. Remarkably, psychoanalysis, once the dominant and seemingly unassailable technique and reigning theoretical force in psychotherapy, has since suffered what appears to some to be an irreversible decline in the clinically focused mental health professions (Paris 2005). Its status in the current debates about the cause, nature, and purpose of consciousness appears to be correspondingly peripheral though it remains to be seen whether this will continue to be the case. The emergence of neuropsychanalysis, a fusion of neuroscience and psychoanalysis, in the pioneering work of Mark Solms and others would suggest that Freud's work may, after all, be given a second life when placed on a neuroscientific foundation (Solms and Turnbull 2002; Schwartz 2015).

The second approach is to be found in the investigation of exceptional mental states that were deemed to be nonpathological and was undertaken by researchers associated with the Society for Psychical Research (Gauld 1968). F. W. H. Myers (1843–1901) can be taken as the chief representative of this group. His work is rich and suggestive in offering a way to accommodate a broad range of experiences of consciousness and, not least, his notion of “subliminal self,” a larger sphere of consciousness housed in the recesses of the personality that James considered potentially revolutionary for the understanding of consciousness beyond the margins of everyday (Hamilton 2009). The investigations and theoretical proposals about the nature of consciousness coming from this group were almost completely overshadowed, if not discredited, by the rise and dominance of psychoanalysis. More recently, with the decline of psychoanalysis and the emergence of an interest in a broader view of consciousness, Myers' work has come under detailed reexamination, providing a theoretical framework for the possibility that though consciousness is correlated with, it is not necessarily entirely dependent on neurophysiological processes (Kelly and Kelly 2007).

Another related perspective should also be mentioned at this point and that is the one associated with C. G. Jung (1875–1961). While initially a colleague of Freud's, both Jung's formation and the range of his interests and originality of his ideas place him in an independent light. In many ways, he brings together the psychodynamic approach and a vision of consciousness that extends well beyond the personal and pathological. This is embodied in his conception of the psyche as a self-regulating system consisting of consciousness, the personal and the collective unconscious, and with a drive towards greater consciousness that Jung termed “the process of individuation.” The deeper archetypal structures of the unconscious and the relationship between psyche, spirit, and matter that preoccupied Jung's latter work are rich in insights and theoretical possibilities for an understanding of religious and transpersonal experience (Charet 1993; Main 1997). The significance of Jung's psychology for the understanding of consciousness has been largely ignored in academic circles and hence yet to be adequately assessed. Along with James, he is one of formative influences in the emergence of transpersonal psychology (Cortright 1997; Daniels 2005).

Among the pioneers in transpersonal psychology, whose work is clearly focused on the subject of consciousness and its transformation, is a list of researchers and theoreticians. These include the names of Stanislav Grof, Michael Washburn, and a number of others. Grof, in particular, influenced by his experimentation with psychoactives, along with his wife, Christina, has not only developed theoretical additions to transpersonal studies but rooted this in their widely practiced technique of holotropic breath work to transform consciousness (Grof and Grof 2010). In addition, the publications and online presence of prolific integral philosopher, Ken Wilber, whose work was initially rooted in transpersonal psychology, have attracted considerable attention. Lastly, along with the Grofs, mention should also be made of the pioneering work using psychoactive substances to induce altered states and the more recent focused discussion and clinical research that offer considerable potential insight into

the further reaches of consciousness (Walsh and Grob 2005, Richards 2016).

Current Discussions

The cognitive revolution in the neurosciences in the second half of the twentieth century has sparked considerable interest in the relationship between brain function, cognitive processes, and the issue of the origin, nature, and purpose of consciousness. This interest has largely occurred among neuroscientists and persons working in the areas of cognitive science and philosophy of mind. The shared perspective of most working in these areas is rooted in the assumption that a scientific approach to the study of consciousness is the one best suited to attain dependable results. A second widely shared assumption is that consciousness is dependent on and the outcome of as yet understood neurophysiological processes (Velmans and Schneider 2007).

After decades of research, speculation, and discussion, it appears that the phenomenon of consciousness has not yielded to the various attempts to explain its cause(s) and purpose in scientifically acceptable terms. In fact, the extensive literature on consciousness indicates that for all the effort and theory making, it now appears that an exclusively scientific approach has so far fallen short of coming to terms with the “hard problem” of accounting for phenomenal experience and bridging the now famous “explanatory gap” between first-person and third-person approaches to consciousness. In other words, the determinedly third-person scientific approach in its bid for objectivity has not come up with a satisfactory explanation for what causes the subjective first-person experience of consciousness. This quandary has occupied much recent discussion, but there is still optimism that a detailed correlation of third-person observation and first-person experiences, utilizing the sophisticated technologies of brain imaging and other techniques, will eventually lead to more dependable data upon which a theory could be built. Not all share this view. In fact, serious questions have been raised about the

need to reexamine some of the assumptions that inspire such optimism, such as the exclusive dependency of consciousness on neurophysiological processes that are implicit in what has passed as the normative scientific approach to the phenomenon of consciousness (Kelly and Kelly 2007; Kelly et al. 2015). Moreover, it would seem to be reasonable, given that subjective experience is essential to consciousness, to consider exploring the neglected phenomenon of the experience of first-person consciousness, a by no means easy task (Varela and Shear 1999).

To undertake to develop a rigorous methodology of first-person empiricism presents a considerable challenge, and not least because of the claim that objectivity and the conventional scientific method are the only means of attaining any degree of certitude. Yet, arguably, without first-person input, there is the risk of accomplishing little more than measuring ever more precisely the outside of the fishbowl of consciousness. And while arguments have been made about the limitations of introspection for the attainment of insight, it is becoming increasingly clear there are traditions of disciplined introspective analysis, developed in various cultures over the ages that have attained a remarkable degree of understanding about the geography of the inner landscape of consciousness. These mental disciplines and contemplative practices could be of considerable value in exploring and excavating the inner world of consciousness (Shear 2006). And in the contemporary West, techniques and approaches have emerged that have contributed to the mapping of the inner realm, such as Jungian and transpersonal psychology, both of which offer methods of disciplined introspection and analysis, largely ignored or dismissed by current neuroscience and those working in the philosophy of mind (Cortright 1997; Daniels 2005). If research into these techniques is pursued, in the course of time, a sufficient amount of accumulated experience and data could make a significant contribution to understanding the phenomena of consciousness and eventually lead to the bridging of the “explanatory gap” between third- and first-person consciousness (Lancaster 2004).

Yet, admirable as this proposal is, it nevertheless still confers on science a position of authority and even sovereignty over the entire field of consciousness that begs for examination. The qualifications and even reservations that are worthy of consideration have to do with the degree to which the current scientific model remains implicit in the proposal of supporting first-person empirical approaches in the study of consciousness. This ignores both the fact that current science is rooted in what Sir John Eccles called “promissory materialism” and that there are other, equally valid ways of knowing (Gadamer 1989). Moreover, undue privileging of the first-person perspective and especially assimilating it to a scientific model may, once again, end with limiting knowledge and truth to the control of the scientific method. In the case of religious or transpersonal events, this has the unfortunate consequence of reducing the spiritual and transpersonal to personal experience, uncoupled from the context of the traditions and communities that nurture such experiences. The result is to make such events vulnerable either to turning into extravagant forms of isolated beliefs and practices or being subsumed by an exclusivist scientific understanding, both to the detriment of the wider culture. The upshot of this is to require that religious and transpersonal knowledge claims be deemed valid or falsified only if they can or cannot be evaluated and replicated through various forms of strictly controlled disciplined methods of introspection (Ferrer 2002).

If such an approach claimed the high ground, it would be a further step in the direction of what has been called “the empiricist colonization of spirituality,” something that many transpersonal theorists have been unknowingly working towards in spite of their intent and claim to do otherwise. There are other ways to include the spiritual into a transpersonal model of consciousness, and one is to follow the tracks of the religious traditions, practices, and cultures themselves that, after all, provide the sources and context for most of the spiritual experiences people have. Instead of the experiential and empirical approaches and their limitations, perhaps a participatory perspective that is inclusive and pluralistic and is expressed

in personal, interrelational, communal, and place-based ways would be more adequate (Ferrer 2002).

To conclude, it would seem that a multifaceted approach to the study of consciousness would have the value of freeing researchers from the hegemony of scientific empiricism, as well as providing a way to steer cautiously through the channel of first-person consciousness and transpersonal experiences. After navigating these areas, a foundation could then be laid for a multidisciplinary and even transdisciplinary perspective where a disciplined pluralism would pervade and all parts of the spectrum of consciousness would be given due consideration, including perspectives from other cultures and times, religions, and spiritualities (Charet and Webb 2007).

Consciousness, Altered State of

Benjamin Beit-Hallahmi

Department of Psychology, University of Haifa, Haifa, Israel

Altered states of consciousness (ASC) are said to occur when an individual subjectively experiences a change away from everyday thinking, following a psychological or physiological interference with normal brain/consciousness functioning. Altered states may be involuntary, as in dreaming, hallucinating, hypnagogic dreaming, sleep deprivation, fasting, hunger, illness, stress, trauma, psychosis, epilepsy, hypoxia, or hypnosis. Voluntary altered states may result from ingesting N₂O, coffee, alcohol, cannabis, opiates, cocaine, music, tobacco, MDMA (“Ecstasy”), LSD, Mescaline, psilocybin, or DMT (Dimethyltryptamine).

The term first appeared in 1966, and the above description makes clear that the phenomenon is extremely broad and may cover a wide range of both subjective experiences and observable behaviors.

Altered states have been tied to general theories about the genesis and maintenance of religion in general and of the history of particular religions.

The altered states of consciousness hypothesis proposes that the genesis of religious ideas is the result of dramatic or “peak experiences,” such as

trance, dissociation, or ecstasy. The rationale (if that is the right term) of this approach is that religious ideas appear in human consciousness as the result of unusual, dramatic experiences. When such experiences intruded into the consciousness of some ancient individuals, it led to the development of ancient religious systems. Popular books offer stories of ancient founders who had mystical visions, ate psychedelic mushrooms, and formulated religious claims which started particular traditions. Maslow (1970) stated that the origin of every “high religion” is “the private, lonely, personal illumination, revelation, or ecstasy of some acutely sensitive prophet or seer.”

Beyond speculations about the appearance of religion in prehistory, there have been suggestion that religious changes throughout history and the development of new movements were similarly related to mystical experiences, which were themselves a consequence of altered states.

Such accounts tie religion to dramatic, unusual, irregular, or abnormal psychological processes, but most religious activities are rather undramatic, and most believers don't claim ecstatic or mystical experiences or revelations.

Altered states are sometimes related to the occurrence of religious experience, or may be synonymous with them. Fasting, meditation, and the study of religious texts are tied to reports of religious experiences. But this happens among religious virtuosi, and is irrelevant to the masses who maintain religion and institutions, and don't report mystical experiences.

When we try to reconstruct the actual appearance of religious practices, the evidence about the first activities related to religion is found in archeological finds. Discoveries in sites going back more than 100,000 years ago demonstrate the practice of significant investment in burials. We find grave goods, i.e., articles left with the dead body, usually food, enabling the dead person to survive in this new stage of existence. What we consider modest grave goods were a serious sacrifice. This is the first time we can refer to a denial of death by humans, and this is the actual beginning of religion. Later on, we find examples of massive investments in burials and in temples or pyramids. What is clear is that such projects

require co-operation and leadership, and any kind of altered state would hamper their completion.

Minority experiences, however intense, cannot explain the hold of religion on the majority of humanity. The processes that give rise to religion cannot be anomalous or deviant. Religion first appears, or is learned and embraced, through the operation of ordinary, automatic, brain-based mechanisms. Universal and natural processes lead brains to develop and accept religious ideas. Religious ideation is natural and intuitively plausible because of innate mechanisms that lead us to imagine reality in terms of egocentric, anthropocentric, animistic, teleological processes and to interpret events through intentionality and design. These powerful mechanisms lead to the attribution of consciousness and volition to nonhuman objects, real, and imagined.

Xenophanes (sixth century BCE) coined the term anthropomorphism when noting the similarity between religious believers and the imaginary representations of their gods, with Greek gods being fair skinned and African gods being dark skinned, and wrote: “if an ox could paint a picture, his god would look like an ox.”

In the discussion of individual and collective religiosity, what is often overlooked is that every aspect of religion and religiosity is socially learned. The way most individuals become committed to a particular religion is by being born into it, and that is how most believers have acquired the identity they so often proudly proclaim. The process of the social learning of local religious ideas is so smooth because religious ideas are naturally acceptable to young minds, unlike the counterintuitive ideas of physics.

A believer's specific persuasion is actually determined at the moment of birth, and formed as a specific identity, not related to conviction or choice. Of about one billion Hindus, the vast majority are the products of a Hindu family, and the vast majority of self-identified adult Roman Catholics similarly grew up in a Catholic family. Ninety-nine percent of the world's religious believers have followed parental and communal teachings in acquiring the belief system they hold.

We take it for granted that children will follow in their parents' footsteps, and they do. Social learning, despite its seeming simplicity (and maybe because of it), remains the best explanation for most religious actions. It is the best explanation for the overall prevalence of religion, for individual religiosity, and for the most varied and the most dramatic of religious acts and movements. To the question, "Why do people believe in God?" the best answer remains: "Because they have been taught to believe in God." The social learning of religion means that individuals believe in Krishna, Jesus, Jehovah, or Osiris, only because their parents taught them these specific beliefs.

Not only are religious beliefs predictable, following local culture and tradition, but even the particular content of religious experience is totally determined by cultural learning and tradition. The effects of peyote (containing mescaline) on Mexican and American Indians depends whether they belong to the Native American Church, in which case they have theistic experiences, or if they are Catholics, in which case they may have visions of the Virgin Mary.

Religious experiences or mystical states are by definition private events, like dreams, that we know about only by first-person reports. Laubach offered the following description: "perceptions of psychic intrusions into the stream of consciousness that are interpreted by the actor as not originating within the self's normal information channels." While religious experiences are reported as spontaneous, a psychological interpretation will regard them as being the product of combined brain processes and social learning.

Spirit possession is learned as individuals master the required cultural expertise, and glossolalia could be easily taught. Together with social learning, there is an individual, causative part. With the same exposure, not every individual will have such an experience, and it is assumed that personality factors and neural states play a role in creating this behavior.

Sometimes these private experiences become public or involve public activities. Well-known mystics in history felt compelled to report them publicly, even though they were said to be

indescribable and unutterable. Individual experiences reported by religious devotees or leaders become part of religious histories and traditions and sometimes lead to the formation of new movements.

Psychedelic drugs or hallucinogens, such as LSD, mescaline, and psilocybin produce striking visual sensations, of intensified light and color, objects may seem alive, there can be distortion of time and space, objects change in size or shape or become two-dimensional, there may be depersonalization, and experience of union with the surrounding world. Sometimes the experience is reported to be religious, but the percentage of subjects who so describe it in this way has varied from 5% to 90%, though more typically 35–50%. Most psychedelic experiences include no references to religious ideas. There are some claims of "timelessness," depersonalization, and vivid visual sensations. Religious experiences do not involve the horrors sometimes reported with these drugs.

Brain pathology is directly tied to altered states of consciousness and to reported religious experiences. Hyperreligiosity has been reported in cases of mania, obsessive-compulsive disorder (OCD), schizophrenia, and temporal-lobe epilepsy (TLE). Is it possible that famous mystics in history suffered from specific brain syndromes? St. Catherine of Genoa (1447–1510) was diagnosed as a possible epileptic, and so was Teresa of Avila (1515–1582). Emanuel Swedenborg (1688–1772) started having visions of angels, heaven, and hell at age 55. According to his visions, the world is divided into three regions: the heavens, the hells, and the world of spirits. These visions were contained in his many books, and the movement he inspired is known as the New Church signified by the New Jerusalem in the Revelation. He has been described as a probable epileptic, in addition to suffering from mania and schizophrenia. Ann Lee (1736–1784), the founder of the Shakers, and Joseph Smith, Jr. (1805–1844), the founder of Mormonism, have also been described as possible epileptics.

Research on religious experiences or mysticism refers on the one hand to reportedly spontaneous, personal experiences leading to written or

oral testimony and related religious commitment (“mystical experiences”), and then to the findings from mass surveys which ask respondents about private experiences. Over the past 50 years, one can find mass surveys of believers who report having had intense experiences. These are examples of the questions used in such surveys:

Have you ever been aware of or influenced by a presence or power, whether you call it God or not, which is different from your everyday self?

Would you say that you had ever had a “religious or mystical experience,” that is a moment of sudden religious insight or awakening?

Large surveys are important in assessing mass beliefs. With representative samples of the US population, a survey in 2004 showed that 37% responded to the item “I feel God’s presence” by “many times a day or most days” and 22.4% of the population never or almost never had the experience. Some traditions and some social settings will increase the frequency of reported experiences. In the USA, the poor are more likely to report visions or hearing the “Voice of God.”

In most reported private experiences, there is an alleged contact with a sensed presence, or “another consciousness.” An illusory sensed presence or the conviction that another person or another consciousness are close by have been produced by the stimulation of particular brain areas. Another common description is of an experience of mystical union with a deity or with nature. In addition to the reported “sensed presence” of cultural spirit entities, which characterizes so-called mystical experiences, individuals report feeling the presence of loved ones who have died. This has been known as “grief hallucinations,” bereavement hallucinations, “hallucinations of widowhood,” or “hallucinations associated with pathologic grief reaction.”

How significant are altered states of consciousness in explaining religious ideas and acts? It seems that dramatic experiences are less representative than group co-operation inspired by beliefs about the spirit world. Reports of mystical states can be found only in recent historical times, with religious institutions well in place, so that a personal experience is already part of tradition.

Claims of revelations have been made, but there is no way of knowing the mental states of the founders of historical movements. Even if we want to assume that mystical experiences reached through altered states have played a role in the appearance of new movements, real evidence is hard to come by. Real leaders may be inspired by unusual experiences, but they also need to deal with the realities of this world to create any viable movement.

At the same time, we can point to the findings of mass surveys, where significant minorities of believers report “sensed presence” of spirit entities. Very few of these individuals will try to start a movement or even aspire to religious leadership positions.

Conservative Judaism

Nicole Gehl

The Priory Hospital, London, UK

Under the initiative of the German rabbi Zecharias Frankel, Conservative Judaism (also known as historical Judaism and Masorti in Israel) emerged in Europe in the mid- to late nineteenth century. Dr. Solomon Schechter, former president of the Jewish Theological Seminary, is credited with bringing the movement to the United States,

where it is now the second highest represented of Jewish denominations, claiming 40–45% of Jews who affiliate.

Viewing both the Orthodox and Reform movements to be extreme, Conservative theorists sought to find a middle ground, which maintains or conserves aspects of Traditional Judaism, while allowing for Judaism as it is lived to adapt to the modern world. Jewish doctrine has a stronger emphasis on behaviors and actions than on feelings, thoughts, and intentions (Cohen et al. 2003); this has different psychological implications across the various denominations. For Reform Jews, *halacha* (Jewish law) is not binding; rather, there is an emphasis on the autonomy of the individual to select which aspects of Jewish practice and ritual are personally meaningful.

Like Orthodox Jews, Conservatives believe in the authority of the *halakhah*; however, they interpret sources within their historical context in an attempt to balance traditional principles and rituals with modern life as it continues to evolve. In this spirit, Conservative Jews find it permissible for women to be rabbis and to worship together with men in services. Still, there remains an emphasis on the importance of keeping kosher, performing daily prayers, and observing the Sabbath and other holidays. The use of the Hebrew language is predominant in services so as to conserve original nuances of meaning.

Conservative Jews are more tolerant of other branches of Judaism than the Orthodox tend to be (Mayton 2009), but due to the perceived threat to Jewish cultural and religious identity, intermarriages are forbidden. Intermarriage additionally poses psychological problems, according to Conservative Jewish belief, as it negatively impacts family dynamics. Children of two-religion marriages may feel torn between desired religious practices and parental loyalties on a conscious or subconscious level (Kornbluth 2003).

For Conservative theorists, principles and stories from Jewish sources and texts are continually subject to examination and reevaluation so as to ascertain their applicability to modern circumstances. There is an intrinsic tendency towards retaining traditions and ethical positions; however, Conservatives invite dialogue and

exploration within the Jewish community. The cultural valuing of externalizing internal thoughts and questions may make Conservative Jews less vulnerable to physical and mental health difficulties often associated with spiritual struggles and/or questioning religious practice. Further to Orthodox Judaism's emphasis on Torah study as a lifelong endeavor, the Conservative approach advocates also the study of sources outside of the tradition and not to be limited to the questions and answers found internally. Likewise, it calls on its congregants to take their knowledge of Torah into other areas where they are learned: science, literature, philosophy, history, and all other relevant disciplines (Jewish Theological Seminary of America).

Although Jews had a prominent role in the origins of talking therapies, there is little research on which psychotherapeutic approaches are most effective with Jewish clients, belonging to specific denominations, or in general. However, Schlosser (2006) points out that non-Orthodox Jews have a positive association with mental health and psychotherapy in contrast with Orthodox Jews, who have a tendency to ascribe to the stigmatism of psychotherapy.

Contemplative Prayer

Ann Moir-Bussy
School of Social Sciences, University of Sunshine
Coast, Sippy Downs, QLD, Australia

Contemplative prayer, sometimes known as centering prayer, meditation, and mindfulness, has a long history of practice within both Western and Asian religious and metaphysical traditions. Christian, Buddhist, Taoist, Hindu, Greek, Jewish, and Islamic sources all have examples of varying forms and practices of contemplation. Contemplation is the focusing of the mind on a single theme, idea, or spiritual concept. Through contemplation what is focused on gradually reveals its depth and secrets to the mind of the meditator, who gradually becomes aware of the whole of which he or she is a part. Contemplation is about silence and stillness, about receptiveness, listening, and love. “Be still and acknowledge that I am God” (Psalm 46:10). In the Christian tradition, the early Desert Fathers referred to HESYCHIA as stillness, quiet, and tranquility, the purpose being to create a solitary place where one could still the mind and focus in love on God or on God’s Word within. Contemplative prayer is seen as a relationship with God. It is an opening of one’s mind and heart to the ultimate mystery and goes beyond thoughts and emotions. It is in this receptive silence and listening that one finds contact or relationship with the Indwelling Trinity.

Mystical Traditions

Many of the mystical traditions use meditation or contemplation to reach transpersonal states of non-duality. Benedict, in the sixth century, developed a particular way of contemplating the scriptures – *lectio divina*. Eastern Orthodox practice used the Jesus Prayer for contemplation and this is well described in *The Way of the Pilgrim*. John of the Cross also wrote extensively about the way of contemplation leading to divine union (see Arraj 1986). From the Christian West many mystical writers emphasize the effect of the contemplative’s encounter with God as one in which the Spirit of God becomes one with the subject. Thomas Merton could be described as perhaps the most prominent Christian contemplative of the twentieth century, and he classified Christian contemplation into three types, first from the teaching of the early Greek Fathers: active contemplation, natural contemplation, and mystical theology or “infused” contemplation (Rothberg 2000). Other authors who brought renewal of contemplative practices to modern times include M. Basil Pennington and Thomas Keating (Scotton et al. 1996). Along with Thomas Merton, these monks aimed to revive the contemplative tradition and bring it to the everyday world outside of the monasteries. There are over 40,000 practitioners in over 39 countries who form an ecumenical community and practice centering prayer (Ferguson et al. 2010, p. 309).

Mindfulness

Both the Buddhist and Taoist traditions speak of mindfulness – a wakeful awareness or presence to both the internal and external workings of oneself, again for the purpose of opening one to an inner consciousness. Thich Nhat Hanh, a Buddhist, sees the purpose of mindfulness as the development of what he terms “interbeing” – being in touch with all aspects of one’s relationship to others and to the universe. This includes inner and outer relationships, a connectedness, in the present moment. “Mindful awareness is fundamentally a way of being – a way of inhabiting one’s body,

one's mind, one's moment-by-moment experience" (Shapiro and Carlson 2009, p. 5). It is both awareness and practice, which is also the same for contemplative prayer.

Individual and Awareness

Carl Jung's psychological teaching about the stages of life has a direct relevance to Christian prayer. Jung's focus on the symbolic life and the need to journey inwards with focus and attention to bring what is in the unconscious into consciousness is similar to the contemplative journey; Jung's term for the God archetype in a person was the Self and the journey to individuation was a process of integrating all aspects of one's person and being governed by the Self. For him, it was also a reciprocal relationship. Edinger (1984) comments on Jung's notion of Christ's incarnation being a "continuing" incarnation and that "in psychological terms, the incarnation of God means individuation" (p. 84). In other words, the incarnation takes place within each individual. This process requires awareness of the transpersonal self within one's psyche and then living as one with the self. This transformation can be achieved through contemplative prayer, mindfulness, and meditation. The writings of John of the Cross also created a psychological climate in which people were led to consider if they were called to contemplation and to a life that led to deeper understanding of the divine mysteries and one's connection to these.

Psychological Effects

Cortwright (1997) summarizes research that has been done on meditation used in psychotherapy as having five possible effects: relaxation and self-regulation strategies, uncovering repressed unconscious contents, revealing higher states, reciprocal inhibition, and growth of new consciousness and transformation. While the focus in Christian contemplative prayer was not on these effects but more on a deeper knowledge of God, all contemplatives from the Desert Fathers through to modern day contemplatives experienced varying

phases of the above. In striving for stillness and in listening to the Word within, they encountered many aspects of themselves both frightening and repulsive (unconscious contents), both conflict and struggles; they strove for self-emptiness of a nihilation of self (in Buddhist terms), till transformation was achieved. Psychotherapy can enhance spiritual practice, and conversely a spiritual practice such as contemplative prayer and mindfulness can enhance one's psychological well-being. From a Freudian psychological perspective, contemplation is similar to the technique of free association in that the latter leads a person to a progressively deeper understanding of what is significant and meaningful (Cortwright 1997). It leads, as noted above, to a greater unfolding of the self, an opening of intuition and creativity. More recently, Ferguson et al. (2010) examined the psychological and spiritual process which accompanied centering prayer and the impact of centering prayer on everyday stress with a group of Roman Catholic parishioners in northern California. After 11 weeks, participants experienced "a change in their relationship with the divine, and (2) a healing of stress through the effects of this relationship, substantiated signs of purification of the unconscious and positive coping behavior. Furthermore (3) the study offered an effective program to integrate spirituality and wellness while preserving the integrity of Centering Prayer as a way to deepen one's relationship with God without reducing it to a relaxation technique" (p. 324).

Contemporary Paganisms and the Psychology of Ordeal

Galina Krasskova
Department of Classics, Fordham University,
Bronx, NY, USA

Ordeal work is a fairly modern subculture term that came into use in the early 1990s by people

who came out of the BDSM, body modification, and “hook sports” (i.e., recreational flesh suspension) demographics and who wanted a term with an emphasis on the psychological and spiritual rather than on the recreational. Ordeal work refers to a body of practices used to inflict a deep catharsis on an individual for purposes such as self-growth, religious sacrifice and/or offering, or rites of passage. These practices most often involve physical pain, and the rituals themselves are usually done in a spiritual or at least a carefully crafted context. The term “ordeal master” was coined by Belgian ordeal worker Lydia Helasdottir to refer to an ordeal worker who was skilled and trained in facilitating ordeals for others. (It should be noted that many Pagans choose to use pseudonyms or ritual names, either in honor of their Gods or, more practically, to protect their professional identities. These are most often names by which the individuals in question are known within their religious communities. In one case, the individual interviewed for this entry asked to be referenced only by her initials for greater anonymity). The physical techniques involved in ordeal work are varied but often include either singly or in various combinations scalpel cuttings, branding, skin removal (a type of controlled flaying), tattooing, hook suspension, hook pulls, flogging, needle play, sensory deprivation, endurance rituals, and ritual psychodrama. While there are many different Pagan religions, regardless of the religion involved, the lexicon of pain remains the same: according to ordeal workers, the viscera of these practices, when utilized in a controlled manner, have the power to heal, transform, and render the practitioner receptive to their Gods.

The use of pain and body modification as spiritual tools is not new. Examples of scarification, tattooing, body modification, branding, flogging, and the ritual use of pain predate modernity by thousands of years and are found in cultures the world over. Examples run the spectrum of experience from the Catholic devotee who crawls on his or her knees to visit a sacred shrine, to the Hindu who practices kavadi, to the Native American engaged in sun dance, and to contemporary polytheists and Pagans who choose to utilize pain-based rites as part of their own spiritual process.

Contemporary Paganisms are the modern reconstructions of pre-Christian polytheisms. While each Pagan religion may have differing pantheons, cosmologies, and cultural origins, in general they share the belief in many Gods and Goddesses, some degree of animism, and an emphasis on ancestor veneration. Heathenry is the commonly accepted name for contemporary Norse polytheism. The difference between Heathenry and Norse Paganism is a denominational one: Heathens tend to give far more theological credence to a body of medieval texts that include the Poetic Edda and Icelandic Sagas, whereas Norse Pagans rely not only on textual evidence for various practices but also on their own personal religious experience, called within these communities UPG or “unverified personal gnosis” (Krasskova 2005).

In his seminal work “Sacred Pain,” Ariel Glucklich (2001) posits that the rise of the medical profession, the easy availability of pain killers, and the introduction of anesthetics into general use led to the development of a psychology of pain that quickly categorized anyone choosing to remain in pain as abnormal. From there, it was but a small leap from abnormal to mentally ill (Glucklich 2001, p. 195). By the middle of the nineteenth century, according to Glucklich, there was a deep divide between illness and religion in which “pain had lost its religious connotations” (Glucklich 2001, p. 196). This coincided with the rise of the medical hysteric and scientific positivism. Essentially as the Enlightenment and post-Enlightenment social changes altered the status of religion, it also altered the status of pain. The result has been that Western society as a whole has lost its “capacity to understand why and how pain would be valuable for mystics, members of religious communities, and perhaps humanity as a whole” (Glucklich 2001, p. 201). This is the controversy surrounding the conscious use and inducement of pain that modern ordeal workers have inherited.

Self-defined Northern tradition shamans, practitioners of Heathenry or Norse Paganism, have largely pioneered the development of the ritual use of ordeal within their communities. The idea of shamanism is itself a very controversial practice within Norse polytheism (commonly called

Heathenry by practitioners). While outside the scope of this entry, it is worth noting that despite its marginalized status, the impact on the greater Heathen and Norse Pagan communities has, over the past decade, been tremendous, leading to a possible schism within the religion. Northern tradition shamans refer to ordeal work as one of the many paths to achieving an altered state (Kaldera 2007). Other practices designed to induce trance and create a state of spiritual receptivity include prayer and meditation, ritual work, the use of rhythm and dance, ascetic practices such as fasting, the use of entheogenic plants, sacred sex or sexually based practices, and divine possession. Practitioners acknowledge that it is uncommon to work with all eight techniques but rather point to personal preference, brain chemistry, the influence of one’s primary deity, and personal “wiring” as the determinant for which tools one might utilize (Kaldera 2006).

The use of pain and ritual ordeal raises many questions about the privileging of the body, not the least of which is quite simply: why pain? Ordeal workers consistently emphasize that the point of an ordeal is not in fact the pain experienced. Pain is viewed as little more than a tool to facilitate an internal emotional or psychological process. S. R., an ordeal worker for over a decade, offered the following insight:

You must learn to share space with pain, to embrace it, move toward it, and enter into its dance. It is in no way a process of turning away from pain. Pain becomes one’s partner in the dance that is the ordeal, the horse by which one travels, and the door through which one walks. In the center of pain, you know what’s true (Personal communication with S.R. on August 26, 2008).

Northern tradition shaman Raven Kaldera, who has both practiced, administered, and taught ordeal work for over 20 years, notes:

Pain gets one’s attention like nothing else. All the distracting details of one’s life fade right away when pain happens, especially if it’s intense and ongoing. You are immediately fully present for the situation, assuming that you’re not dissociating – and you shouldn’t be, dissociation is the last thing you want to be doing. Pain is the focus of last resort, and it is also a wonderful tool to break through your psychological barriers, especially for people who place a high value on control. If it’s done properly and mindfully, it strips you down, rips you open,

and lets the Spirits in (Personal communication with Raven Kaldera on April 10, 2008).

Not only was pain consistently viewed as a sacred tool by those interviewed, so was the body itself. Many spoke of the body as the primary tool or “interface” between the world of spirit and the human world, the vehicle through which human beings experience everything, including spirituality. The need or desire to honor the body as holy figured strongly in their practices, despite the seemingly contradictory fact that these practices often involved extreme pain. Kenaz Filan, writer and Voudoun priest, commented that “ordeal work privileges the body in that it reminds us that we *have* a body” (personal communication on May 23, 2008).

The actual physiological change that occurs during the course of an ordeal is a complex biochemical process. When a person is being physically hurt in a sustained way, the first thing that happens is raw pain and usually a good deal of it. It takes some time for that to change. Which chemicals eventually engage, and how much of these chemicals the body produces, varies depending on each individual’s biochemistry and, surprisingly, the attention they focus on their hurt as well as the purpose they ascribe to it. Ongoing, noticeable pain can affect one’s concentration and one’s attention to such a degree that it causes the body to release painkillers that will work to mitigate the pain. The major factor in this physiological process is the release of opiate-like endorphins, but this is by no means the only factor. Lesser chemicals calm, soothe, and create a certain amount of mild euphoria. At this point, the subject might still technically be in pain, but they simply may not care nearly as much (personal communication with Raven Kaldera, May 20, 2008). It is at this point, theoretically, that the transformative process of the ordeal begins, which raises a second question: are ordeal workers sexual and psychological masochists or perhaps addicted to that chemical release?

Surprisingly, the answer appears to be no. Many, in fact, expressed a fear and dislike of pain while at the same time affirming its usefulness as a spiritual tool. S. R. put it bluntly when

she said, “every ordeal worker is no more a masochist than everyone who uses fasting as part of their spiritual practice is anorexic. For some of us, though by no means all, pain is an incredibly useful tool. That doesn’t mean we like the pain itself” (personal communication with S. R. on May 25, 2008). Ordeal worker and shaman Eric Tashlin elaborated further on this particular dynamic:

Masochism is defined as deriving pleasure, often sexual in nature from pain, humiliation or maltreatment (paraphrased from WebMD’s article on masochism <http://dictionary.webmd.com/terms/masochism>). As ordeal workers, devotion or spiritual development rather than worldly pleasure is the objective in our work. I believe that an interest or fetish in masochism can be counter-productive for people looking to the ordeal path for spiritual fulfillment because enjoyment, and especially sexual pleasure, clutters the mind and distorts the spiritual process. In cases where masochists choose the ordeal path, it is important to tailor their ordeal process so as to avoid areas that are fetishized. For instance, while flagellation or flogging can be a valuable ordeal tool, I would not use it with someone I knew to have a sexual fetish for such acts. Instead I would work to find an ordeal tool that was not of “interest” to them sexually or emotionally (Personal correspondence with ordeal master Wintersong Tashlin on September 28, 2008).

As Mr. Tashlin inferred, while many (though by no means all) ordeal workers are also active in the BDSM community, they draw a clear line between their sexual practices and their spiritual work, and in the extremely open-minded micro-culture that comprises Northern tradition shamanism, in which nearly every (consensual) sexual variation is accepted including masochism, none of them self-identify as masochistic. Rather it appears that pain is conceived of solely as a sacred and very practical tool.

There are four primary ways in which pain-based ordeals are utilized within this community: (1) expiatory, in other words to make reparation to a specific deity for an offense or error committed; (2) as an offering to a specific deity, a devotional act of pain, or in *imitatio* of a God or Goddess’ mythic ordeal. For instance a shaman devoted to the God Odin may choose to hang by hooks in a ritual setting in replication of Odin hanging on the world tree for power; (3) as a means of what some

ordeal workers call “hunting for power”: in other words to overcome a personal weakness, face a fear, or open oneself to an experience that will, in the ordeal worker’s mind, lead to greater wisdom; and (4) as an act of magic, i.e., to channel the pain and “energy” raised to achieve a specific goal.

Finally, inevitably the question arises about what the difference might be between an ordeal worker engaging in a cutting, branding, or some other painful practice as part of a ritual ordeal and a person who self-mutilates. According to ordeal workers, the difference between the two lies in personal agency (personal communication with S.R. and R. Fishman, November 1, 2008). The cutter has little control over what they are doing. They have stumbled into a practice that alleviates their pain and are using it because it works. The problem, from an ordeal worker’s perspective, is that one who self-mutilates is using these techniques without control or knowledge, very much like an addiction. An ordeal worker, on the other hand, has no particular psychological attachment or *need* to use a particular technique. Their motivation derives from practicality and self-knowledge.

To those who practice it, ordeal work can be a powerfully transformative practice, one that connects ordeal workers more deeply to their spirituality. While this body of practices may seem strange or even repellent to the mainstream Northern tradition community and to others completely outside of this community, ordeal work is gaining adherents and gaining ground as one of the many practices within the growing body of devotional work coming to define contemporary polytheism in general and Northern tradition shamanism in particular.

Conversion

Benjamin Beit-Hallahmi

Department of Psychology, University of Haifa,
Haifa, Israel

Conversions are dramatic turning points in life, tied to external or internal events (personality processes and traumatic events), and leading to the reassessment of one’s life, then to identity change, and then a biographical break with the past. It is higher self-esteem, or self-love, which allows us to define the new identity. During times of stress and crisis, as during times of individual distress, there is a regression to “artistic,” religious, or magical ways of thinking. When realistic coping fails, magical thinking takes over. When realistic coping seems to be failing or futile, individuals may turn to magical or religious ways of coping. When all hope is lost, these ways of coping do seem worthwhile.

Magical gestures that aim at reaching a conscious break with the past and the shedding off of one’s identity include name changes, body changes, and “sex change.” These magical or symbolic gestures are not usually sufficient for a real metamorphosis in personality. A name

change does not lead to personality change, and a new nose does not do it either. Even a “sex change” often fails to bring about happiness, and these intentional scripts often end in disappointment.

Testimonials of conversion tell us of a miraculous transformation, from darkness to a great light, from being lost to being found. There is a sharp contrast between earlier suffering and current improvements. The conversion narrative always includes a wide gap between the past and the present, between corruption and redemption. The power of transformation through enlightenment is proven through this gap. In many religious traditions, pilgrimage, leading to conversion, is the magical route to achieving private salvation and healing.

Every religion tells us stories of miracles and transformations. For most people, they remain stories about events that happened long ago and far away. For others, they become part of their own personal history, which they are ready to share with us. These cases of rebirth should command our most serious attention, because what they represent are indeed immensely positive transformations, which are impossible under any other conditions. The lame do not start walking, and the blind do not enjoy the sweet light of day; these miracles do not often happen. But those who find themselves psychologically lame, self-destructive, and desperate, sometimes emerge from darkness and belie everything that happened earlier in their lives.

In all conversion stories, a past of doubt and error is transformed into a present of wholeness in one great moment of insight and certainty. This is a new birth, leading to a new life. And the new birth often follows reaching the lowest depths of despair and consists of (in the words of William James) “. . . an unexpected life succeeding upon death. . . the deathlike terminating of certain mental processes. . . that run to failure, and in some individuals. . . eventuate in despair.” And the new birth creates a wider belief in “. . . a world in which all is well, in spite of certain forms of death, indeed because of certain forms of death – death of hope, death of strength. . .” (James 1902/1961).

Since William James, and even before, students of religion have looked closely at the phenomenon of conversion. First, because it is dramatic in the phenomenological sense. We have reports of “mystical states,” visions, hallucinations, and voices. These may all be regarded as psychotic symptoms, but they are tied to even more dramatic events. The convert reports a cognitive illumination, a sudden apprehension, and a comprehension, of a divine plan for the cosmos and for individual destiny. The emotional reactions accompanying such a momentous revelation can then be easily justified and accepted. What the individual experiences is a true revolution.

The descriptions offered by James focuses on the subjective report of identity change and conscious mood change, which follows a narrative formula. It can be regarded as a literary or folklore genre, a miracle narrative so easily predictable, and so tend to doubt it. The convert’s autobiography is divided into Before and After. Life until the moment of epiphany is described as wasted, a total mistake.

This formula is reminiscent of the death-rebirth idea, basic to initiation rites in tribal societies. Death and resurrection are claimed by the convert as her path to salvation, and her movement closer towards the sacred realm. There is another level, beyond the dramatic subjective “experience”: objective reports which indicate a change in behavior and functioning, a true miracle cure, putting previously uncontrollable drives under good control.

A small minority within the small minority of converts in this world (99.9% of believers follow their parents’ teachings) consists of those whose conversion has been followed by dramatic changes for the better in their lives. How do we account for successful, stable, conversions, which we might think of as “overachieving”? There are cases involving a real sea change in actual behavior, as sinners become not always saints, but productive members of society, self-destructive behaviors are dropped, and a lifetime of failure and hate is changed into garden-variety (or better) love and work.

In these cases the self-reported identity change is tied to a role change, a victory, maybe

temporary, over pathology, subjectively viewed as a victory over destiny. Because many of the people undergoing transformation are deeply disturbed, even a temporary improvement, as it happens in many cases, is impressive.

The religious career of a seeker, or a convert, is a totally modern idea. In many cultures today, religious identity is still determined by kinship and considered immutable, like “race.” It is a matter of birth within a certain family. The idea of individual choice and voluntary change is in itself a relatively novel idea, tied to secularization and individualism.

Conversion experiences start with conversion dreams. Salvation stories appear in response to dreams of a new self, a new society, and a new world. We have to approach the phenomenon of the religious imagination and the inevitable collisions between religious fantasies and reality. The phenomenon of fantasies about self-transformation and world transformation, which is so common among humans, plays a major role in the history of religious movements. An examination of salvation dreams should start with the individual search for security and wholeness and with the general idea of self-transformation.

Susan Sontag, in an interview on the BBC, on May 22, 2000, said that the American dream is to reinvent yourself, be born again, but this is not just an American idea: it is a universal modern dream, and possibly a universal human dream. The broadest frame of reference we can use is the common human phenomenon of attempts to escape and transcend destiny and identity. I include here any attempt to redefine biography and identity against “objective” conditions defining that identity. Such attempts at rebirth, at identity change through private salvation, may be quite common in certain historical situations. We may speak about a private utopia, as collective utopias are less and less in vogue. Dreams and actual attempts at escape and rejuvenation should be examined on the basis of context, content, or consequences, and point to a whole range of possibilities. The fantasy of escaping one’s destiny, the dream of identity change, is all too human. So many people see their lives so far as a first draft. We all dream of being of becoming somebody else

and something else, breaking with our destiny. This is the dream of private (and collective) salvation. More or less often we feel “I am stuck in this life situation but I should be somewhere else.” Behind the explicit, outspoken fantasy of a new self or a new world lie unspoken processes, which always parallel to those on the surface.

The source of self-reported rebirth is found in internal, conscious and unconscious, conflicts. These conflicts are solved and a balance is reached through an attachment to a set of beliefs, specific ritual acts, changes in everyday behavior and functioning, and support by a group structure. The problem with psychological rebirth is its inherent instability. Real transformation is hard to come by. The illusion of rebirth may lead to good outcomes but is often insufficient to maintain balance inside a personality system long beset by disharmonies and imbalances. This is clear when a variety of purely secular strategies, from psychotherapy to plastic surgery, are followed on the road to self-transformation.

Every successful case of individual rebirth is the result of an internal truce among opposing personality elements. One possible interpretation assumes that in conversion we see what is called a “superego victory.” An internal conflict between the conscious ego ideal and the unconscious, archaic, parental introject is won by the latter. The child becomes more parental, and this often happens in postadolescence, as the child grows older.

Another interpretation of successful conversion uses Freud’s concept of moral masochism. According to classical psychoanalysis, the superego is formed as sadistic impulses directed at the parent are recoiled and internalized. Then the superego, parentally derived, commands self-effacement, if not self-sacrifice, as the punishment for aggressive fantasies. In moral masochism, the superego is satisfied through submission and humiliation. The outer peace and happiness observed in many converts is the result of this final peace between ego and superego, which releases all the energy that was put into the conflict for productive use. This may be the source of many positive, altruistic behaviors. The yearning for peace and wholeness is met by religion

through the internal peace between superego and ego. At the conscious level this is experienced as acceptance by God or Jesus, forgiveness, and love, reported by converts ever since St. Augustine of Hippo. Freud suggested that what is achieved through superego victory is a reconciliation with one's father and with all paternal authorities, including father gods. We forgive our parents and are forgiven by them in turn. Of course, this happens in fantasy, and we are not talking of real fathers but imagined ones, consciously and unconsciously.

Another possible explanation is that the convert has gone through the internalizing of a loved and loving imaginary object, which then supports the whole personality system. This internalized object may serve as a new superego, supplying the ego with a control system, which has been missing, and making possible a real control of destructive impulses. A similar process may take place in secular psychotherapy. Early infancy splitting of the mother into good/bad object operates in converts who reach a state of complete euphoria, denying negative impulses and negative realities, which are bound to resurface nevertheless.

But at another level, a psychological analysis may direct us to noting that cases of rebirth actually represent a way of expressing hostility towards one's parents. In terms of individual and family dynamics, every identity change is a rebellion against one's parents, who usually created the earlier identity, and against one's past. When a young individual, who grew up in the average family, joins a new religion, he is declaring a revolt against his parents. He may rebel also through finding a new, better parent in his secular psychotherapist, and psychotherapists are always better parents. The message of a child's conversion is often one of denouncing parental hypocrisy and shallowness. On a collective, generational level, finding new identities is a total ideological rebellion. The new religious identities constitute in many cases a rejection of the faith of the parents and of the parents' everyday lifestyle. At the same time, the rebellion against the parents may also mean the assumption of the parental role.

What should we make of all these different and sometimes contradictory speculations? Only the

realization that in cases of true self-transcendence, something important and far-reaching must be going on beneath the surface. The process is one of accepting authority, loving authority, or internalizing a loving and supportive (but still demanding) authority. What happens in these conversion miracles is an experience of love, both giving and receiving of love. On a conscious level, this is the unconditional (or maybe conditional) love of God, and St. Augustine has already reported on that. On an unconscious level, it is the unconditional love of a father, a mother, or a total parental image.

Conversion (Islam)

Ali Kose
 İlahiyat Facultesi, Marmara Üniversitesi,
 İstanbul, Turkey

Islam makes a distinction between conversion to Islam and conversion from Islam. The former is called *iẖṯida* or *hidayah* (divine guidance),

whereas the latter is *irtidad* (apostasy) (Watt 1980, p. 722). Islam introduced the concept of *din al-fitrah* (innate religion) to express that everyone is endowed at birth with a natural ability to know God. The Qur'an states that every soul before creation was asked the question by God "Am I not your Lord?" and the souls answered "Yes!" to it. Thus, Muslims consider all children as Muslims until they reach puberty. The tradition of the Prophet puts that "children are born possessing the *fitrah*, and it is their parents who turn them into Jews, Christians or Muslims" (Faruqi 1979, p. 92). Therefore, by converting to Islam, one turns to the religion which is already present in him by nature. It is for this reason that some converts to Islam prefer the word revert to convert (Kose 1996, p. 101). In Christianity, one cannot have a conversion experience unless the Will of God is involved (John 6: 44). In Islam, likewise, the act of conversion is attributed to the Will of God (Qur'an 10:100).

How to Become a Muslim

There is no specific procedure or ritual for joining Islam. The only condition for the person who converts is to declare, usually in presence of two witnesses, the *shahadah*: "I bear witness that there is no God but God (Allah) Himself, and I bear witness that Muhammad is His messenger." Anyone who says this credo is considered to be a Muslim. However, one is recommended to undergo the greater ablution (*ghusl*) to purify the body symbolically of the earlier ignorance or disbelief. The new Muslim is supposed to believe in such basic creeds of Islam as the accountability in the afterlife and all Prophets (Qur'an 2:136) and also commit himself/herself to keeping the five pillars of Islam (praying, fasting, giving alms, etc.) as well as abstaining from alcohol, pork, and adultery.

It is believed that one's sins, upon embracing Islam, are forgiven by Allah and having the purification of the greater ablution signifies this belief. On embracing Islam, one may or may not select a Muslim name unless his present name has an un-Islamic trait. Circumcision is not obligatory

upon adult (male) converts. The act of conversion to Islam should be voluntary, conscious, and out of free choice, relating to what the Prophet said: "declaration by tongue and affirmation by heart." There is nothing to prevent a person from becoming a Muslim; no conditions are imposed; none is debarred for Islam considers itself a universal religion.

A Muslim man has the right to marry a Christian or a Jewish woman (Qur'an 5:5). A Muslim woman cannot marry a Christian or a Jewish man according to Islamic jurisprudence though there is not a Qur'anic prohibition. It is forbidden for a Muslim man or woman to marry someone who does not believe in God or an idolater or polytheist (Qur'an 2:221).

The Propagation of Islam

Great religions of the world may be divided into missionary and non-missionary based on the definition that in missionary religions the spreading of the truth and the conversion of unbelievers is considered to be a sacred duty by their founders or scriptures. Buddhism, Christianity, and Islam may be classified as missionary while Judaism, Hinduism, and Zoroastrianism fall into the category of non-missionary (Arnold 1913, p. 1).

The propagation of Islam is called *tabligh* or *dawah* (literally means call or invitation). Both words are used in various verses in the Qur'an. *Tabligh* means to make available to non-Muslims the message of Islam. The Qur'an (16:125) commands the Muslim to enable others to share and benefit from the religious truth. The word *dawah* is used in the sense of the religious outreach or mission to exhort people to embrace Islam as the true religion. *Dawah* also covers the mission directed at fellow believers (Denny 1987, p. 244). The primary aim of *dawah*, if directed to the Muslims, is to remind them of the teachings of Islam. In the case of the non-Muslims, the objective is to enlighten them about Islam. However, Islam does not have an institutionalized form of missionary work if missionary means the deliberate activity or to send representatives to win converts. Islamic mission is regarded being a duty of every Muslim rather than being

an option. Thus, Muslims are charged with the responsibility of being the model of right conduct for all mankind. The absence of clerical order imposes on every Muslim the obligation to understand the message of his/her religion and to convey by precept and example to non-Muslims who inquire about Islam (Qur'an 16:125). It is the Muslim's responsibility to pave the way to reconcile non-Muslims to Islam. For example, the Qur'an (9:60) demands Muslims to render the legal alms (*zakah*), levied on every Muslim who is wealthy, to the people whose hearts have been recently reconciled, namely, converts or potential converts, among others (Hamidullah 1979, p. 155).

However, Islam has made it explicitly clear that the diversity of ideologies and creeds is natural to mankind. The Qur'an (2:256) states clearly that there is no compulsion in religion. Many Muslims today believe that the age of proselytization is gone, and Islam, being a fairly well-known faith, needs no active mission to attract converts. To them, the stability of Muslim family life; the absence of drinks, drugs, etc.; and the overall discipline of Muslims, in particular those who live in the West, will itself send powerful signals to non-Muslims. Studies reveal that converts to Islam enter into the fold of Islam by various means and for a variety of reasons. Some accept it after studying it for a long time, and some enter it in order to be able to marry a Muslim or after marrying a Muslim. Many converts recount that their conversion was the result of the positive example of Muslims. Thus, both intellectual and emotional motifs play a great part in conversions to Islam, especially in Western context (Kose 1996; Poston 1992).

Conversion Therapy

Chris Babits

Department of History, The University of Texas at Austin, Austin, TX, USA

Conversion therapy is the practice of trying to change an individual's sexual orientation from homosexual (or bisexual) to heterosexual by using psychological, religious, or spiritual interventions. Modern efforts to change sexual orientation date to the late-nineteenth and early-twentieth centuries. The most outspoken advocates of conversion therapy today are fundamentalist Christian groups and other organizations that have socially conservative understandings of sex, gender, and sexuality. The main advocacy group for conversion therapy is the National Association for Research & Therapy of Homosexuality (NARTH), which has worked closely with conservative political organizations, like Focus on the Family, since its formation in 1993.

There have been many therapeutic techniques used to assist the sexual conversion process.

These have included: ice-pick lobotomies; aversion therapies (such as electroshock therapy); hormone treatments; psychoanalytic talk therapy; and religious counseling. Recent forms of conversion therapy focus on the patient's gender identity, emphasizing how a deficient masculine or feminine self-identification causes men and women, respectively, to develop same-sex desires. In May 2000, the American Psychiatric Association stated its opposition to conversion therapy (Board of Trustees 2000). Other medical, scientific, and governmental organizations in the United States and parts of Europe have also expressed concern over conversion therapy's potentially harmful effects.

Freud and Conversion Therapy in the Early Twentieth Century

Sigmund Freud (1856–1939), the founder of psychoanalysis, had conflicting views on sexual orientation change efforts. He stated that hypnotic suggestion could sometimes lessen homosexual urges in patients. Freud believed that Eugen Steinach (1861–1944), a Viennese endocrinologist who transplanted testicles from heterosexual to homosexual men in efforts to change sexual orientation, had shown biological determinants for sexual desires. He cautioned, however, that Steinach's transplant procedures could only be effective for men. Later research revealed how the body's immune system rejects transplanted glands, proving Steinach and Freud wrong.

Freud offered his most complete examination of female homosexuality in "The Psychogenesis of a Case of Homosexuality in a Woman" (1920). Freud described his analysis with a young woman whose parents were distressed over her same-sex desires. He wrote that efforts to change sexual object choice could only happen under favorable conditions. Freud also stressed how homosexuality was neither an illness nor a neurotic conflict, observing how "in general to undertake to convert a fully developed homosexual into a heterosexual does not offer much more prospect of success than the reverse."

In 1935, Freud penned what has become a well-known statement that sexual object change was unlikely. In a letter to an American mother, he wrote that being a homosexual "is nothing to be ashamed of, no vice, no degradation; it cannot be classified as an illness; we consider it to be a variation of the sexual function, produced by a certain arrest of sexual development." Freud thought that, at best, he could "succeed in developing the blighted germs of heterosexual tendencies."

Other medical officials reported various results with homosexual patients. Sándor Ferenczi (1873–1933), a Hungarian psychoanalyst, hoped to eliminate same-sex sexual object choice in his patients. When this proved difficult, Ferenczi was satisfied with reducing what he considered homosexual men's hostility toward women. He also helped some patients increase their sexual attractions to the opposite sex. Abraham Brill (1874–1948), an Austrian-born psychiatrist, reported "very gratifying" results with his homosexual patients. Brill's cure for homosexuality consisted of restoring heterosexual potency. In 1930, Austrian Wilhelm Stekel (1868–1940) published his work on the treatment of homosexuals. Stekel stated that "success was fairly certain" for curing homosexuality, which he considered a disease. In 1932, Helen Deutsch (1884–1982), a Polish-American psychoanalyst, presented "On Female Homosexuality," a paper ultimately published in *The Psychoanalytic Quarterly*. In the article, Deutsch relayed her analysis of a woman with same-sex sexual object choice. Instead of becoming a heterosexual, which Deutsch would have considered a successful treatment, the patient achieved a positive libidinal relationship with another woman.

Ego-Psychology and Post-World War II Conversion Therapy

The Second World War had a tremendous effect on conversion therapy. The United States military increased its surveillance of homosexuals, barring gay men and lesbians from military service as well as employment in defense industries. These

efforts helped pathologize homosexuality in the United States, which had its impact on medical diagnoses in many Western nations. In 1952, for example, the American Psychiatric Association's *Diagnostic and Statistical Manual of Mental Disorders (DSM)* listed homosexuality as a mental illness. For three decades, many psychiatrists considered homosexuality a disease that had to be treated.

In the postwar decades, psychiatrists, psychologists, pastoral counselors, priests, ministers, and rabbis helped homosexuals convert to heterosexuality. In the 1950s, Edmund Bergler (1899–1962), an Austrian-born American psychoanalyst, published several books that promised up to a 90% cure rate for homosexual patients. Bergler popularized his methods, which included bullying patients, in magazine articles and books aimed at non-specialists. In 1962, Irving Bieber (1901–1991), an American psychoanalyst, published *Homosexuality: A Psychoanalytic Study of Male Homosexuals*. Bieber argued that a heterosexual shift was possible for men who had a strong inclination to abandon their homosexuality. He recognized that some patients, particularly those with a greater desire for change, benefited more from psychotherapeutic efforts to change their sexual object choice.

Religion influenced the practice of conversion therapy in several ways in the immediate postwar period. On occasion, American psychiatrists discussed Judeo-Christian understandings of sex, sexuality, and marriage. The Atascadero State Hospital in California, for instance, published a series on the causes and treatment of homosexuality in its periodical, *The New Outlook*. In the January 30, 1956 edition, one of the hospital psychiatrists wrote that patients felt long-standing feelings of guilt and anxiety. These feelings resulted from violating society's moral code and the Ten Commandments. Despite declarations of scientific objectivity, early Cold War psychiatrists fused religious morality with their therapeutic practices. The political climate of the postwar period, which included the accusations that homosexuals were likely communists, fueled homophobia. This, in turn, convinced men and

women with same-sex desires that they needed to seek help for their supposed immoral, and diseased, behavior.

By the late 1960s, conversion therapy had taken an unexpected turn. Inspired by humanistic psychology, sexual liberation groups offered gay men and lesbians opportunities at heterosexual self-actualization. Proponents of lysergic acid diethylamide (LSD), a powerful hallucinogenic, believed that the drug could help gay men and lesbians achieve heterosexuality. Other humanistic-inspired therapies suggested that gay men and women engaged in sexual activity with members of the opposite sex. For these therapists, sex offered a spiritual redemption for same-sex desires.

Critics of conversion therapy observed how religious understandings of sex, gender, and sexuality had influenced postwar psychiatry thought on homosexuality. Scholars and activists in the anti-psychiatry movement criticized the religious moralizing of conversion therapists. This movement, which included psychiatrist Thomas Szasz (1920–2012) and social theorist Michel Foucault (1926–1984), condemned the moralizing language inherent in psychiatric diagnostic criteria.

Gay Liberation, Feminism, and the Transformation of Conversion Therapy

In 1973, the American Psychiatric Association removed homosexuality per se from the *Diagnostic and Statistical Manual*. The APA based its decision on years of gay activism which stressed that homosexuality was not a mental illness (Bayer 1981). Some gay rights activists agreed with the anti-psychiatry movement – professional psychiatry relied on religious moralizing to list homosexuality as a mental illness. Other gay men and lesbians worked within mainline Protestant organizations to build support for the acceptance of sexual variance. Over time, second wave feminism proved as important to the changes that happened in conversion therapy.

In the early 1970s, fundamentalist Christians became a prominent part of conversion therapy.

The Jesus People, a group who have a literal interpretation of the Bible, converted former homosexuals to Christianity and heterosexuality. Other fundamentalist Christians counseled homosexuals on the streets of Los Angeles and San Francisco. Residential ex-gay ministries also formed in the early-to-mid-1970s. The most famous called itself Love in Action. Located in San Rafael, California, Love in Action provided Biblically inspired counseling for men and women with unwanted same-sex desires. Counselors fused fundamentalist Christian theology with ego-psychology's ideas about the family and proper sexual development (Erzen 2006; Gerber 2011).

By the early 1980s, a coherent form of conversion therapy began to take shape. Elizabeth Moberly (1949), a British theologian, developed an innovative approach for counseling men and women with same-sex desires. She theorized how fathers served as important love sources for their sons and how mothers did the same for their daughters. Moberly wrote that homosexuality developed when children failed to bond with the parent of the same sex. Instead of shunning the formation of homosocial bonds, as previous therapists had, Moberly suggested that men and women form close relationships with members of the same sex. This would help men and women satisfy the needs they had from poor relationships with, respectively, their fathers and mothers. Key for all of this, though, was prayer, which was at the center of the healing process (Moberly 1983).

In the United States, Leanne Payne (1932–2015), a prominent pastoral counselor, continued to revolutionize conversion therapy. In her writings and ministry work, Payne castigated the failure of professional medicine to understand the moral and spiritual dimensions of sexuality. She believed that, as a spiritual problem, homosexuality was easy for God to cure. The biggest problem, according to Payne, was opening up a space for God to heal. Payne, who had been influenced by Charismatic healing practices, harnessed every tool she could. This involved using the power of healing touch and anointing oil to treat her counselees' homosexual

attractions. Unlike earlier therapists, Payne was blunt about what she was doing: expelling Satan from the homosexually inflicted (1981).

Moberly and Payne's therapeutic interventions emphasized the importance of performing normative gender roles. Women, for example, had to put on makeup and wear dresses in order to feel not only feminine but also rid themselves of same-sex attractions. Male therapists were inspired by these therapeutic insights. Joseph Nicolosi (1947–2017), the author of *Reparative Therapy of Male Homosexuality* (1991), used these ideas as he charted a new path for healing men with same-sex attractions.

Conversion Therapy Today

Conversion therapy was in decline by the late 1980s. The American Psychiatric Association had removed ego-dystonic homosexuality from the *Diagnostic and Statistical Manual* in 1987. This designation had justified the treatment of men and women who felt that their same-sex desires were at odds with their ideal self-image. Over the next decade, professional medical organizations issued statements against conversion (or reparative) therapy, arguing that treatments to reorient sexual desires were, on the whole, damaging to patients. In 2001, the US Surgeon General issued a statement proclaiming that there was no credible evidence that sexual orientation could change.

In the 1990s, conversion therapy became a prominent part of the United States' culture wars. The National Association for Research & Therapy of Homosexuality (NARTH) formed in 1993. NARTH's founders thought that the American Psychiatric Association, not to mention other medical organizations, had fallen victim to gay rights political correctness when they removed homosexuality from the *DSM*. NARTH formed close relationships with conservative religious groups, including Focus on the Family. Joseph Nicolosi, one of NARTH's founders, spoke at numerous Focus on the Family events beginning in the early 1990s. Nicolosi was also a contributor to other conservative political organizations, like

the Reverend Louis Sheldon's (1934 -) Traditional Values Coalition.

Conversion therapy has remained a divisive political issue. Gay rights activists have pushed for conversion therapy on minors to be banned. In the United States, 14 states, the District of Columbia, and over 40 municipalities have banned conversion therapy on minors as of October 1, 2018. Proponents of conversion therapy, for their part, are challenging these bans, contending that these legislative initiatives violate freedom of speech, religious freedom, and parental rights. Some conversion therapists believe that the conservative US Supreme Court will overturn these bans in the near future.

Coping Skills

Storm Swain

Lutheran Theological Seminary at Philadelphia, Philadelphia, PA, USA

“How are you coping?” is a common question from a caregiver, be it a mental health professional or a religious or pastoral caregiver. At first blush it seems a relatively straightforward question, yet at depth the person suffering in a stressful situation is being asked to make a highly complex assessment of the nature of the stressor, their subjective sense of suffering, an appraisal of their ability to function and for how long under these conditions, and what physical, psychological, social, and spiritual resources, behaviors, and practices are enabling them to do so. It is no wonder that people sometimes respond “I don’t know. I just am” or “I’m not.”

The American Psychological Association currently defines coping as “The process of dealing with internal or external demands that are perceived to be threatening or overwhelming” (Gerrig and Zimbardo 2002).

Classical theories of coping used to focus primarily on the nature of the stressor following the logic that the more stressful a situation was, the

more difficult it was to cope. In 1967, psychiatrists Thomas H. Holmes and Richard H. Rahe, working backwards from medical records, devised a stress (Social Readjustment Rating) scale that allocated a numeric amount that purported to assist one to calculate the cumulative effect of stress in one's life over the previous year (Holmes and Rahe 1967, pp. 213–218). Life circumstances such as death of a spouse were assigned the highest value of 100, divorce 73, and right down to events such as Christmas at 12 points. A person who was calculated to have more than 300 points in a year was seen to be in serious risk of developing a physical illness in the coming 2 years, those above 150 having a moderate risk. That is, the more stressful situations you encounter, the more likely it is that you will not be able to cope. The benefit of such a scale was that it alerted people to the fact that life changes viewed as life enhancing, such as marriage or going on vacation, may also be experienced as stressful.

However, what such a scale failed to indicate is that it is not simply the nature of the stressor that inhibits one's ability to cope, we need to also assess the person's subjective sense of suffering and ability to adapt and live into a new reality or at least hold onto the hope that one will be able to do so in the future. For example, divorce may be a great shock and occasion immense grief for one person and may occasion a sense of relief and liberation for another. The death of a loved one from physical deterioration near what would be societally expected as the end of a life cycle may be much easier "to cope with" than the untimely and unexpected death of a child or teenager. There is, therefore, a relationship between the nature of the stressor and the subjective sense of suffering that cannot simply be discounted.

Consequently, it is helpful to be conscious of whether this is what McGoldrick, Carter, and Garcia-Preto define as a horizontal or a vertical stressor (McGoldrick et al. 2011, p. 7). They see a vertical stressors as the "influence of historical issues that flow down the family tree, influencing families as they go through life," including factors such as poverty, racism, violence, and addictions (McGoldrick et al. 2011, pp. 7–8). Horizontal stressors are "developmental and unpredictable

influences that affect families as they go through life," such as life-cycle transitions and unpredictable untimely personal, historic, economic, and political events (McGoldrick et al. 2011, p. 8). Here we can see that both stress and coping are highly complex, embedded as we are in our social locations, our family, and cultural and historic contexts. However, just as patterns of dysfunctional responses to stress may be generational, so may be patterns of coping and resilience in response to such.

In assessing coping skills, again, one must attend to the individual's assessment of their suffering and their ability to face it. Persons whose families have suffered in the past, such as in the Holocaust, or who have suffered violence in another context, such as in a country torn apart by civil war, may find their current situation relativized by suffering of a greater magnitude. However, current suffering may also activate trauma that was unable to be processed in another context or even in another generation. It may be in the context of safety that suffering is able to be borne and worked through in a new way that is more functional. The surest way to assess the subjective sense of another's suffering is by careful, attentive, empathic listening where you hear the other's story in the context of their own world view.

Like the growing recognition that grief is a process, there is also a growing recognition that coping is a process, not simply a static event. This process involves a number of different elements over time. Kenneth Pargament, one of the primary researchers in the field of religious coping, uses a model that draws on the earlier work of Lazarus and Folkman (1984) which visually depicts the interdependent relationship between:

- Resources and Constraints
- Situations, Appraisals, Activities, Outcomes
- Coping Functions.

(Pargament et al. 1992, p. 132)

Taking into account the functions over time, it can be seen that coping may have its own life cycle according to the person, situation, and resources. How we cope after the immediate impact of an acute stressor may be different to

how we cope in the short term, to coping with long-term suffering. This reality is reflected in the diagnosis of post-traumatic stress disorder that can currently only be diagnosed after 30 days. It may be normative to be acutely stressed after the immediate impact and even in the short term after a potentially traumatizing event; however, if the duration is longer than a month and seriously impacts one's ability to function in usual life circumstances and social relationships, the person is assessed not to be coping but traumatized if they exhibit symptoms of hyperarousal, avoidance, and intrusion of thoughts, memories, and images associated with the event. Therefore in assessing a person's coping, one must take into account the duration of time since the event and the level of impairment of daily life.

Researchers vary on how they describe the mechanisms people use to cope with stress. They often dichotomize the results into categories such as positive/negative (Abu-Raiya et al. 2011), adaptive/mal- or less adaptive (Pargament et al. 1992; Roesch 2004), reactive/responsive, and helpful/harmful (Doehring 2006). For example, Carrie Doehring notes that "Harmful ways of coping may involve compulsive behaviors such as overworking, overeating, overexercising, anorexia, substance abuse and addiction, excessive shopping, obsessive gambling, cutting oneself, and compulsive sexual behaviors, like excessive masturbation or use of internet pornography" (Doehring 2006, p. 85). For the purpose of this article, the terms functional and dysfunctional are used.

Functional and Dysfunctional Methods of Coping

Persons may use various physical, psychological, social, and spiritual resources to cope in the face of life stresses. These may range from unconscious defense mechanisms such as denial, rationalization, repression (Fenichel), and splitting (Klein), to sophisticated cultural belief systems that help people deal with existential anxieties and life events such as death, disaster, disability, and disease (Freud). Functional coping mechanisms in an acute phase of stress enable a person

to soothe themselves and stay connected to reality as a whole, even if they may dissociate from the particular stressor. Examples of such may be someone who on occasion may have an alcoholic drink at the end of a stressful day to someone who denies the reality of the death of their loved one because they "can't believe it." Such an immediate response may be entirely normative. However, if someone cannot get through the evening without having a drink, stressful day or not, or cannot face the reality of the death of their loved one with the immediate evidence of their body after several hours, that may be seen as dysfunctional. This also has to be assessed in light on what is normative for each person. For some having a drink at the end of a day is normative and for others, depending on their culture or religion having a drink, may not only be rare but may be against their belief systems and contribute to the feeling that they are not coping. Coping needs to be assessed against one's world view, including one's religious and cultural location, and current practices.

Functional forms of coping are those thoughts, behaviors, and resources that enable a person not just to survive in the face of a changed reality but to adapt to that change. Examples of such may be physical anxiety management and emotional coping techniques such as deep breathing, muscle tensing, and relaxation; thoughts such as "this too will pass" and "I'm scared now but I trust I will get through this"; cognitive problem solving; seeking support from others; and religious coping mechanisms such as the use of prayer, meditation and devotional practices, religious ritual and community, reading sacred texts, and seeking guidance from a religious authority such as an imam, pastor, priest, rabbi, Rinpoche, or guru, depending on the person's tradition.

Much has been written on religious coping as a contribution to dealing with stressful events in life. One must be careful however to inquire about coping skills across the spectrum of the person's life, physical, psychological, social, and spiritual, so as not to discount the input of one form of coping that may be particularly functional for a person in the face of stress. An example of this may be the use of massage for recovery

workers or the choice of a respite center housed in a church, mosque, or synagogue over other non-religious respite centers, in a disaster.

- Collaborative style
- Deferring style
- Self-directive style

Religious Coping

Harold Koenig states that “Religious coping is the reliance upon religious belief or activity to help manage emotional stress or physical discomfort” (Koenig 1992, p. 107). This focus is two pronged, that which examines religious activity and that which explores religious belief; in some faith traditions this means the crucial question of “how they relate to God when they experience stress and what kinds of religious activities are used to cope” (Doehring 2006, p. 88).

Despite the caution about making sure one assesses coping across the spectrum of resources, research has shown that religious coping does not simply replicate nonreligious coping but offers an additional element (Pargament and Koenig 1997).

Relation between unconscious defense mechanisms and religious world view is complexified by the question of embedded and deliberative theology. Often we regress to a prior, or more primitive response in the face of threats to our well-being. We may also do this religiously. Hence, persons who may not consciously believe that God directly intervenes in person’s physical illness may say “What have I done to deserve this?” or “God must have done this to teach me a lesson.” The question may be whether this God is seen as benevolent or punishing or what control God and we may have in regards to the situations we encounter.

The work of Koenig, Pargament, and Neil on a scale to assess the relationship between one’s relationship with God and religious resources and how they function has made available the tool RCOPE: “a comprehensive measure of religious/spiritual coping” (Pargament et al. 1999). This measure, based on a theistic world view, draws out whether a responder views God as primarily benevolent or punishing and, drawing on Pargament’s 1988 research, sees three different patterns of religious problem solving emerging. These are a:

“In the deferring style, control is sought from God; the individual places the responsibility for coping on God. In the collaborative style, control is sought with God; the individual and God share the responsibility for coping. In the self-directing style, control rests within the individual; the individual takes the responsibility for coping him/herself” (Pargament et al. 1999). Pargament and his collaborators consistently found that a collaborative style of coping was associated with a greater sense of spiritual well-being and decreased depression and anxiety. Results for the other styles were more mixed, depending on whether God was seen as benevolent, punitive, or abandoning (Phillips et al. 2004) or whether the situation was seen as beyond one’s own control (Pargament et al. 1990). Later researchers Ana Wong-McDonald and Richard Gorsuch (2000) suggest surrender as an additional coping style. Pargament also adds Pleading to the list of approaches such as in the study on the use of religious coping in the hospital waiting room (Pargament et al. 1999).

There are manifold quantitative articles on religious coping in medical and mental health situations which support the association between the use of religious resources and quality of life and adjustment to serious illness (e.g., Brady et al. 1999; Koenig 1998; Koenig et al. 1988, 1991; Johnson and Spilka 1991; VandeCreek et al. 1997, 1999) and decreased length of hospital stays or readiness to return home (e.g., Iler et al. 2001; VandeCreek et al. 1997). Of note are the studies that explore coping after a disaster, such as that of the terrorist attacks on Sept. 11, 2001, in the United States. Abu-Raiya et al. examined the “stressful interpersonal events experienced by Muslims living in the United States following the 9/11 attacks” (Abu-Raiya et al. 2011). Swain examined the experience of the chaplains who worked at the Temporary Mortuary at Ground Zero (Swain 2011). Ninety percent of a “nationally representative sample” of the general population reported “turning to religion” to cope after the

terrorist attacks of 9/11 (Schuster et al. 2001). These studies occasion the question of whether persons use current religious practices and resources to hold them up in times of disaster or whether persons take up religious practices in times of acute threat that may then lose meaning or cease to be followed in long-term recovery.

Current Research

The growing edge in research on coping is that focusing on multicultural and cross-cultural coping in a global context and that explore the non- or polytheistic religions such as Nalini Tarakeshwar's "Initial Development of a Measure of Religious Coping Among Hindus" (Tarakeshwar et al. 2003) and Yu His Chen's "Coping with Suffering: A Buddhist Perspective" (Wong and Wong 2006).

Coping with Death

Khyati Tripathi

Department of Psychology, University of Delhi,
Delhi, India

What is Death? Yes, it is cessation of life and of the physical body but it can manifest itself in ways more than these. It can have a disabling effect on the bereaved after losing a loved one or it can create an overarching anxiety or fear about one's own death or of a significant other. In both the scenarios, when a real death has happened or when there is a discomfiting anxiety related with death, coping becomes inevitable. This essay explains how religion and other religious aspects help individuals cope with death anxiety as well as death of a loved one. It presents how religion interacts with the human psyche in order to create a balance and synergy.

Death Anxiety and Religion

There have been different theories explaining what death anxiety is. The most significant view

amongst these perspectives is considered to be of Freud's. For Sigmund Freud (1953), *thanatophobia* is a remnant of the unresolved conflict in the unconscious. Moving away from the psychoanalytic view, Belsky (1999) simply defined death anxiety as “the thoughts, fears, and emotions about the final event of living that we experience under more normal conditions of life.” While death anxiety at a collective level works at preserving the human species and nurtures creativity by finding expression in different art forms ranging from drama to poetry, at an individual level it might prove to be debilitating if not coped with efficiently. It might lead to avoidance of conversations around death and dying and on certain occasions might also lead to panic attacks.

Anxiety which is characteristic of humans as proposed by Langs (1997) is the “Existential Death Anxiety” which essentially is a product of humans' ability to be aware of the inevitability of death and to anticipate future. This death anxiety is dealt with by humans through “*denial of death*” which is the primary coping strategy through which they defend themselves against it. The denial of death might manifest itself in different mental mechanisms or physical actions. This denial could be adaptive if used in limits or disruptive and emotionally burdening if used excessively.

What has been understood as the “great anxiety reliever” (Malinowski 1965) is “Religion.” Religion is said to have a calming and stabilizing effect on humans helping them cope with death anxiety. It is because death and religion share an interdependent relationship. Death is believed to have led to the creation of religion. For Tylor (1958), religion originated from the dreams that “primitives” had of their dead. He asserted that dead was not entirely dead and came back to people in their dreams. Religion is almost never talked about without mentioning death.

To understand the connect between religion and death anxiety, it is important to understand how these two are different. Religion, on one hand, is about the connection with a higher power whereas death separates the loved ones. By surrendering themselves to religion, people feel a sense of control ensued with a sense of

hope. While religion provides them with a sense of security, death puts them through unpredictable phases of emotional discomfort. For religions like Hinduism, life and death have been segregated into the categories of the sacred and the profane, respectively. Religion thus establishes itself as the propagator of the power of life. For Lifton (1979), religion is “life-power and power over death.” Religion, thus, helps the followers concentrate on life more than death which provides them with the resources to cope with death anxiety.

It is also “religiosity” or the extent to which the individual believes in God that affects one’s coping. Religiosity could either be *Intrinsic* or *Extrinsic* as was suggested by Allport and Ross (1967). Intrinsic religiosity is about internalizing the faith and living it with commitment without any selfish motives while Extrinsic religiosity is characterized by using religion to meet certain personal and social needs like security or social status. It has been found that there is a negative correlation between intrinsic religiosity and death anxiety which means that individuals with high intrinsic religiosity tend to experience lower death anxiety (Powell and Thorson 1991; Maltby and Day 2000).

Also, what has been found to be effective in dealing with death anxiety is belief in afterlife which is the belief that life will continue even after death. Many mythological scriptures of different faith groups talk about it. For some people, belief in afterlife helps maintain the continuity of life which the idea of death disrupts. Langner (2002) noted that one of the main functions of religion is to reduce the fear of death in its followers through a belief in rebirth, afterlife, and the spirit world. Research findings, however, around the relationship between belief in afterlife and death anxiety have been equivocal, some suggesting that belief in afterlife reduces the discomfort and lowers the death anxiety while others have found no relationship. It is mainly because the idea of afterlife is not uniform across different faith groups. For some faith groups, it is based on the deeds or *karma* in one’s life and, for others, afterlife is about resurrection. Thus, afterlife is not always perceived as a comfortable space because

it is also associated with punishments and judgement and thus might not help the individual cope with the death-related anxiety.

Death Rituals and Coping with Death

Grief and sorrow, pain and loss are experiences associated with Death. Funeral customs remind the living that Death and suffering are integral parts of nature. Death creates an environment of confusion and disbelief. Death rituals play a significant role in helping the bereaved cope with death of a loved one. First and the foremost, it brings the family together in these difficult times. Everyone comes together and works at sharing the emotional pain which promotes solidarity of the group and the much-needed social support. These rituals have a psychological effect on the bereaved that deceased has been given a proper farewell. It creates a feeling of completeness and satisfaction that they have done what they could do. Death rituals offer the space to the bereaved to cope with the loss and readjust into their lives. Death does disturb the order and creates emotional chaos but death rituals provide closure and time to slowly go back and move on with life.

Cosmic Egg

David A. Leeming

University of Connecticut, Storrs, CT, USA
Blanton-Peale Institute, New York, NY, USA

The cosmic egg motif is a major symbol in creation myths, occurring in all parts of the world.

Ancient Egyptians saw the cosmic egg as the soul of the primeval waters out of which creation arose. In one story the sun god emerged from the primeval mound, itself a version of the cosmic egg resting in the original sea.

One Chinese creation myth describes a huge primordial egg containing the primal being, the giant Pangu. The egg broke and Pangu then separated chaos into the many opposites of the *yin* and the *yang*, that is, into creation itself.

The Satapatha *Brahmana* of India contains the story of the desire of the original maternal waters' desire to reproduce. Through a series of prolonged rituals, the waters became so hot that they gave birth to a golden egg. Eventually, after about the time it takes for a woman or a cow to give birth, the creator, Prajapati, emerged from the egg, and creation took place.

The Pelasgians of ancient Greece explained that it was the original being – the goddess Eurynome (a version of the Greek Gaia) – who laid the world egg and ordered the cosmic snake Ophion to encircle it until it hatched the world itself.

The later Orphic cult in Greece preached that in the beginning there was a silver cosmic egg, created by time that hatched the androgynous being who contained the seeds of creation.

In Africa, a Dogon myth says that in the beginning, a world egg divided into two birth sacs, containing sets of twins fathered by the creator god, Amma, on the maternal egg. Some say that Amma was the cosmic egg and fertilized himself.

The Polynesian Tahitians have a myth in which the god Taaroa began existence in an egg and eventually broke out to make part of the egg the sky. Taaroa, himself, became the earth.

The practitioners of the Bon religion in Tibet sing of three cosmic eggs, which led to creation.

As an object prone to fertilization, the egg is an appropriate symbol and metaphor for the idea of potentiality. It is pre-creation chaos waiting to become cosmos. In psychological terms, it is the preconsciousness of the given culture – the collective being waiting to be made conscious of itself. To quote psychologist Marie Louise von Franz, “we can easily recognize in it the motif of preconscious totality. It is psychic wholeness conceived as the thing which came before the rise of ego consciousness, or any kind of dividing consciousness” (von Franz 1972, p. 229). In short, the egg is a symbol of pre-differentiation, differentiation being the essence of the creation of anything. The egg contains within itself male and female, light and dark, all opposites in a state of union. It is perfect entropy and signals the existence of creative power from the very beginning. By extension, the cosmic egg is a symbol of the individual's preconscious state before the process of individuation allows for the hatching of Self.

Counseling and Islam

Anisah Bagasra

Counseling and Islam

Islam provides a distinct cultural narrative that is based upon Islamic doctrine, but is also influenced by the cultures, languages, and countries in which the practice of Islam exists. Islam provides a foundation for those who identify as Muslim, and may play a strong role in influencing attitudes and behaviors, but is not a monolith. Variations in levels of belief and practice make it impossible to group Muslims as a homogenous group. Given this diversity within practitioners of Islam, counseling practices are also diverse and rely on an assessment of an individual's religiosity, as well as their cultural, socioeconomic, and educational background (Kobeisy 2004).

There is also a great deal of variability in conceptions of mental illness within both Islamic theology and in the Muslim population (Husain 1998). Varying conceptions of mental illness (see also ► [“Mental Illness and Religion”](#)), combined with continued stigma regarding mental illness, make it difficult to assess perceptions of both Islamic counseling and psychotherapy, as well as Western-derived counseling techniques within Muslim populations. Within Sufi tradition (the mystical branch of Islam), some contemporary psychological disorders such as anxiety and

depression closely correspond to the idea of “diseases of the heart” which have a psycho-spiritual root. Disobedience to God, or giving in to one's *nafs* (ego) and engaging in sinful behavior can also lead to symptoms that mirror contemporary ideas of mental illness. Beliefs regarding the supernatural origin of mental illness including *jinn* possession, the evil eye, and black magic, all have roots within Islamic theology and can influence an individual's beliefs regarding the effectiveness of counseling. Individuals with strong inclinations toward psycho-spiritual or supernatural causation of mental illness may be more likely to accept Islamically integrated psychotherapy options (Abu-Raiya 2015). The practice of counseling in both modalities continues to increase among Muslims, with a growth in the number of Muslim clinical psychologists and counselors over the past few decades. Additionally, Muslim counselors have formed their own clinics and professional organizations in acknowledgment of the increase in the practice of counseling that is designed to meet the needs and worldviews of practitioners of Islam. The intersection of Islam and counseling is widely accepted today (Abdullab 2007) (see entry on ► [“Islamic Care and Counseling”](#)).

Islamic Counseling

Islamic-based counseling, and Islamically integrated psychotherapy (York Al-Karam 2018), reflects the growing revival of the application of Islamic psychology and traditional Islamic concepts of mental illness. The Islamic conception of mental illness is that all mental and behavioral dysfunction has a psycho-spiritual root and can be directly tied to an individual's higher spiritual awareness of his or her Creator. Traditional Islamic therapies that may be incorporated into contemporary counseling services include Quran recitation (*al-Ruqyah*), Prophetic medicine (*Unani Tibb*), prayer, and *dhikr* (invocation) (Husain 2006; Athar 1993; Haque 2004). Attempts to evaluate the effectiveness of incorporating Islamic forms of worship and religious based coping into counseling with

practitioners of Islam demonstrate the positive impact in many therapeutic settings (Khalid 2007; Hanin Hamjah et al. 2017; Zakaria and Mat Akhir 2017).

The contemporary use of religiously based therapy for treatment of mental illness for Muslim clients has been documented in Asian, Middle Eastern, and African countries (Ally and Laher 2008; Al-Issa 2000; Campion and Bhugra 1998). Numerous researchers have proposed a method of religiously integrated psychotherapy for use with Muslim clients (Abu-Raiya and Pargament 2010; Abu-Raiya 2015; Keshavarzi and Haque 2013). This approach to the treatment of mental illness directly addresses dimensions of Islam that are relevant to the mental health concepts of Muslims, including Islamic methods of coping. Religious psychotherapy has been found to produce significant improvement in patients in Malaysia (Azhar and Varma 2000) and has been introduced, to varying results, in other Muslim societies (Al-Issa 2000).

Traditional Islamic forms of therapy are therefore dynamic and encompass multiple interpretations of the origin of illness and acknowledge the effectiveness of multimodal approaches to therapy that include assessment, diagnosis, talking therapy, and specific actions (see entry on ► “Islamic Psychology”). These practices are tied to evidence that is drawn from religious tradition and perceptions of mental illness within unique cultural contexts. The majority of research and testing of Islamic forms of counseling is occurring in the United States, the Middle East, and most prominently in Malaysia. Further research will determine the effectiveness of these varied techniques and their application to different Muslim communities.

Culturally Competent Counseling

Culturally competent counseling addresses the use of Western forms of counseling with specific cultural or religious groups. In regards to Islam, there has been a growing effort to address cultural competence in counseling Muslim clients, especially in Western societies, among asylum seekers, and refugee populations

(Rassool 2015; Ahmed and Amer 2012; Kobeisy 2004). Inayat (2001) addresses the differences between Islamic counseling and Integrative counseling. Integrative counseling, which corresponds closely to culturally competent counseling, looks at the client from within their social framework. In essence, it takes into account the person’s Muslim-ness without utilizing Islamic tenets in the counseling relationship. Islamic counseling, on the other hand, views the person and their symptoms through the lens of Islamic doctrine. Culturally competent counseling seeks to understand and integrate a client’s beliefs without the client’s worldview superseding core counseling tenets. Common elements of culturally competent counseling include conducting cultural and spiritual assessments in order to assess language, cultural worldviews, spirituality, and acculturation level within an individual client (Ibrahim and Dykeman 2011). Culturally competent counseling acknowledges the stigma that exists within Muslim communities in relation to mental health issues, and has to address the stigma and other myths regarding the counseling process. Negative attitudes toward counseling tend to be a result of perceptions that are colored by religious and cultural beliefs, according to Kobeisy (2004). These perceptions include the attribution that seeking counseling is a sign of a lack of family support. Kobeisy (2004) also found a connection between negative attitudes and a lack of knowledge regarding the purposes and outcomes associated with therapy.

Conclusion

Even with growing acceptance of Western forms of counseling within Muslim populations, and an increasing incorporation of Islamic tenets into psychotherapy, there continues to be stigma toward counseling and other forms of psychological therapy. Understanding the origins of this stigma and distrust is an important part of increasing utilization of mental health care services among followers of Islam. Beliefs regarding the cause of mental illness are also key to the various approaches to counseling. Counseling

and other forms of talking therapies have a long history within Islamic cultures, dating back to practitioners of Sufism as well as medieval Islamic medical practices. The intersection of counseling and Islam is therefore a continuation of a long history of indigenous practice and influence from both Western and Eastern forms of psychology.

Counseling Asians in the West

Yi Yang

Clinical Psychology, University of Massachusetts
Amherst, Amherst, MA, USA

Clinical Psychology, Department of Psychiatry,
Cambridge Health Alliance/Harvard Medical
School, Cambridge, MA, USA

Over the past 50 years, the Asian population has been one of the fastest growing ethnic groups in

the West. Within the Asian population, there is a wide variety of countries of origin, ethnicities, languages, cultural values, religions, socioeconomic status, and acculturation levels. Counseling Asian clients in the West is a multicultural process (Schoen 2005). This entry discusses some of the most important attitudes, skills, and knowledge needed in culturally sensitive and competent counseling services.

Be Aware of the Basic Traditional Cultural Values

Counselors should treat every Asian student on an individual basis and avoid stereotyping, generalizing, and overemphasizing cultural similarities among Asian clients. On the other hand, an awareness of the Asian traditions helps to lay an essential foundation for the mutual respect, understanding, and appreciation in counseling Asian clients (Kim et al. 2001; Maki and Kitano 2002; Sue and Sue 1999). Basic traditional cultural values can include, but are not limited to, the following: (1) Collectivism: Group welfare is prioritized over individual interests. There is a strong moral obligation to serve others, to reciprocate, and to maintain harmony by reconciling, compromising, and accommodating. (2) Filial Piety: Children are expected to respect parents, obey the norms established by the family, support and nurse aging parents, and mind the impact of one's own behavior on one's family. (3) Self-Control: Appropriateness, modesty, and self-criticism in social interactions are highly valued, as is the maintenance of dignity, calmness, and rationality in the face of suffering and highly emotional situations. A pursuit of achievement is also paramount to the individual. (4) Shame: "Knowing shame" is regarded as a virtue, which serves as a dynamic to deter inappropriate thoughts and behaviors that might violate collectivist interests, disdain the family's reputation, or weaken the individual's self-discipline.

In addition to the knowledge of these cultural values, counselors also need to be aware of the impact that these values may have on the

counseling process. Many Western-born Asian clients and most recent immigrants from Asia attempt to rely on the self, family, and friends in dealing with their psychological problems, rather than seeking professional services. This may be because seeking counseling services not only implies a failure in self-control but may also tarnish the public image of the individual, his/her family, and other larger identity groups, any of which can cause intense shame. As a result, the rate of use of psychological counseling services among Asian clients is disproportionately low to their level of need (Kim and Omizo 2003).

Fortunately, however, the use of other values in the Asian cultures can enhance an Asian client's benefit from counseling services. With the cultural emphasis on achievement, for example, Asian clients are willing to seek help for academic difficulties and challenges. Starting with an academic performance-oriented topic may open the door for the exploration of more psychological- or personal-oriented issues (Kim et al. 2001). Emphasis on education means Asian clients also tend to respond positively to psycho-education, offered to understand and better deal with mental health problems. Usually, psycho-education helps to destigmatize the mental health problems and diminish barriers to treatment. Asian clients also tend to respond better to directive than nondirective approaches compared to their Western counterparts, due to the cultural value of deference to authority figures (Kim et al. 2001).

There are other impacts of cultural values on counseling Asian clients. Asians have been taught to employ indirect styles of communicating, especially when it comes to disagreement and confrontation. They are also cautious and reserved in public display of emotion, with negative emotions in particular often expressed in an oblique and understated way. Counselors working with Asian clients, especially those who grew up in Asia, may need to read between the lines to grasp the major distress and its degree of severity. As the alliance develops and the client becomes more open and ready, the counselor may work toward more direct expressions.

Be Aware of the Common Mental Health Problems Among Asian Clients

The most common mental health problems among Asian clients are depressive disorder, anxiety disorder, somatization, and adjustment disorder. It is worth noting that the high somatization may be related to internalized stress due to the repression of public display of emotion (Chun et al. 1996). Common somatization includes complaints of sleeplessness, loss of appetite, and stomach pains (Yagi and Oh 1995). International students or recent immigrants may also exhibit culture-bound syndromes such as *amok* (sudden mass assault), which need culturally sensitive interpretation, diagnosis, and treatment.

Be Sensitive to the Challenges that Asian Clients Face

As people of color, Asians historically have been subjected to many forms of racist oppression and discrimination in the West. Despite significant advancement in civil right movements, many Asian clients, including not only international students and recent immigrants but also Western-born Asians, still encounter overt discrimination and/or micro-aggression in schools and communities. A culturally responsive counselor should be comfortable facing the topic of racism, encouraging the clients to talk about their experiences as people of color in their society, emphasizing with their reported feelings, and understanding the clients' individual distress in the context of the impacts that sociopolitical factors have on the Asian population.

Research shows that the greater the cultural dissimilarity across two cultures, the greater the acculturation stress (Berry 1990). Given the prominent differences between the Asian and Western cultures, Asian clients inevitably face remarkable stress in establishing an individual identity and stance between the two cultures. The extent to which an individual assimilates the Western culture to his or her values, attitudes, and behaviors is *acculturation*. By contrast, the degree she/he retains and identifies with the Asian culture

is *enculturation* (Maki and Kitano 2002). Asian clients fall in a wide range of acculturation and enculturation.

Clients who are high in acculturation and low in enculturation identify with the Western culture. To interact effectively with them, counselors need to be highly acculturated. However, counselors should also be attentive to whether or not such clients are at risk of denying their Asian ethnicity, abandoning the culture of origin, losing traditional support, and internalizing racism in the form of self-hatred.

Clients who are high in both acculturation and enculturation are able to integrate both cultures with the best possible compromise. To meet such clients where they are, counselors must demonstrate sensitivity and competence in multicultural practice. In addition, counselors may want to assess whether they have high levels of anxiety while trying to comply with expectations of both cultures.

Clients low in acculturation and high in enculturation identify with their culture of origin. They are likely to be international students and recent immigrants with limited exposure to the mainstream culture and limited language skills. To help such clients, counselors need to be open-minded, empathic, and respectful. It is essential for the clinician to encourage the Asian clients to openly discuss their cultural and religious viewpoints on the cause of their problems, the cultural conceptualization of their problems, their past coping styles, their health-seeking behaviors, and their treatment expectation (Lee 1997). Interventions should be structured to be compatible with the Asian cultures (e.g., the directive approach) and to match the clients' language skills (e.g., action-oriented activities). In addition, counselors should be aware that their clients may withdraw to the old culture as an escape dynamic.

Lastly, clients low in both acculturation and enculturation reject both cultures. Counselors may need to explore their alienation, frustration, and possible past experiences of failing to satisfy both cultures simultaneously.

When working with second-generation immigrants, counselors should understand and empathize with the cultural conflict between the culture

in their family and the culture of their peers. Internalized racism and struggles with identity (e.g., denial, confusion, self-hatred) are typical challenges. If the Asian clients have issues with autonomy and individualization, counselors may want to empower and facilitate their development in a way that is respectful, sensitive, and compatible to their cultural values in order to avoid unnecessary confusion or guilt.

Art therapy and action-oriented activities may be helpful when working with recent immigrants or international students, especially if they have language difficulties. For example, sand play allows for the exploration and expression of intrapsychic world and interpersonal patterns (Enns and Kasai 2003), without a language requirement. Be cautious with the use of a translator, as it can interfere in the establishment of a therapeutic alliance and can cause complications in therapy. If a translator is absolutely needed, be sure to choose a translator who is able to stay unbiased and assure the client of confidentiality.

The myth of the “model minority,” which implies that the Asians adapt well to their environment and have few educational or psychological problems, causes additional challenges for Asian clients (Serafica 1997, 1999). It fuels the unrealistic expectations that Asian clients set for themselves and their reluctance to seek counseling services. It also influences how the community and other ethnicity groups perceive and react to the Asians, which contributes to the fact that troubled Asian populations often go unnoticed (Yagi and Oh 1995).

Be Mindful About Religion

Religion and spirituality should not be overlooked when establishing counseling relationships. Asians in the West come from a variety of religious and spiritual backgrounds (e.g., Buddhist, Hinduism, Islam, Shintoism, Christianity, ancestor worship). In most Asian cultures, religious beliefs and practices are rooted in tradition and integrated into daily life. When coping with physical illnesses, mental disturbances, or family crises, Asian people traditionally go to religious

organizations and consult monks or ministers to obtain comfort, support, and advice.

Acknowledging and respecting the role of religion in their culture and lives help to establish rapport with other Asian clients. The counselor may inquire whether or not the student is devoted to a certain religious tradition and to what degree. If the answer is yes, the counselor may assess the availability of emotional support or counseling from the particular organization of the student's religion. The counselor may also make use of certain beliefs or practices in the student's religion to facilitate the counseling outcome, for example, encouraging practicing the meditation techniques described in the *Shvetashvatara Upanishad* to Hindu clients or discussing the Four Noble Truths to reduce stress and anxiety for Buddhist clients.

Showing knowledge of Asian religion and spirituality can be a powerful invitation to trust the counselor (Hanna and Green 2004). The knowledge is not merely about understanding a religion; more importantly, it is understanding a religion in the cultural context of how it is actually practiced and who is practicing it. One religion varies from culture to culture. Buddhism, for example, is practiced differently in China than in Burma.

Although the knowledge can help, being culturally sensitive and competent involves a genuine respect for other cultures, an eagerness to learn about other cultures, and an appreciation of the particular heritage of the client (O'Sullivan 1994). As a matter of fact, Asian clients tend to show a considerable amount of respect and appreciation for the counselor who has taken the time to learn about their cultures and religions and who demonstrates understanding, interest, and empathy towards their tradition.

Be Aware of Countertransference

The difference between an effective counselor and a mediocre one is the ability to manage countertransference feelings (Van Wagoner et al. 1991). If the counselors are highly religious themselves and/or they find Asian religions strange or misguided, it is important that the counselors restrain

from imposing their own religious or spiritual points of view on clients, be empathic, and use the understanding of the clients' religion (together with other information) to better understand both the context and nature of the clients' distress, challenges, and strengths. For Western-born Asian counselors who still have their own identity issues (denial or rejection of one's racial identity), working with Asian clients may evoke unresolved pain and emotions. Counselors should explore their own stereotypes, both positive and negative, about Asian clients. Supervision or consultation on countertransference issues will be needed.

Take an Integrative Perspective

Western psychotherapeutic approaches are traditionally based on the assumptions of individuation, independence, self-disclosure, and verbal expression of feelings. Asian values, on the other hand, focus on collectivism, interdependence, self-control, and repression of feelings. Being culturally responsive, counselors need to be able to recognize the strengths and protective factors inherent in the individual as well as in his/her cultural heritage. For example, Asian clients may be used to the health traditions of holistic treatment, herbal medicine, and acupuncture. If they find these health practices helpful, they need to explore and recognize the strengths inherent in the individual and his/her cultural heritage, such as the Confucian teaching of the "middle way," the Buddhist teaching of compassion, the emphasis on family/interpersonal harmony, and the high value of education and achievement. Be open-minded and creative about the potentially therapeutic integration of Western and Eastern healing practices.

Counseling Men

Myounghun Yun

Succasunna United Methodist Church,

Succasunna, NJ, USA

Graduate Department of Religion, Vanderbilt University, Nashville, TN, USA

Men as Gendered Beings

One of the greatest shifts in the practice of mental healthcare has been the increased sensitivity to and awareness of cultural diversity issues, including the influence of gender identity and roles (Sue and Sue 2013). Among other identity factors, gender is now recognized as a salient organizing variable of clients' lives and experiences. In social sciences, critical men's studies emerged as a result of the challenge of feminist movement and scholarship, rejected the recapitulation of traditional male-biased scholarship that excluded women, and generalized men's experience as generic. It investigated masculinities and male experiences as "specific and varying social-historical-cultural formations" (Brod 1987). The shift to viewing men as gendered beings rather than generic persons has had far-reaching implications for practices, research, and theory related to the experiences of men, counseling procedures used with men, and effective counseling models for men.

Three Critical Foci for Counseling with Men

Men develop within contexts that are diverse and multidimensional; therefore, men's needs,

capacities, vulnerability, and expectations of power and relationships vary. For this reason, some counseling psychologists indicate understanding the gendered nature of men as an important cultural competency (Levant and Silverstein 2005; Liu 2005). It is important for professional counselors to work from paradigms that take into consideration the diversity of men's experiences and contexts. To map out various approaches to counseling with men, this article draws on three conceptual themes or foci, which American sociologist Michael Messner used to analyze the complex terrain of masculinity politics in the USA: (1) costs of masculinity, (2) male institutionalized privileges, and (3) differences and inequality among men (Messner 2000).

First, the costs of masculinity address the negative consequences that arise from men's conformity (or disconformity) to the narrow cultural definitions of masculinity. Terms such as crisis, confusion, vulnerabilities, and losses have often been associated with the costs of masculinity. Some of the problems, such as men's emotional distance and longing for power and success, are taken seriously and critically. The issues under this theme include men's poor physical and mental health, the reluctance to seek professional psychological help, shorter mortality, and emotionally shallow relationships. Scholars in men's studies who brought up the notion of "crisis for men" or "crisis in masculinity" identified broadly three major areas in which men as a social group are not doing well: (1) male violence, (2) higher education, and (3) health concerns (Kahn 2009). A vast majority of violence is perpetrated by boys and men. Men's aggressiveness and violent behaviors are part of the traditional, narrow definition of what it means to be "real" men in many cultures. Many boys and men still believe that being violent makes one more of a man, continuing to commit violence against women and children, other men, and themselves. Men's mental health has been a major concern for counseling professionals and religious leaders and communities, given that such health issues tend to translate into problematic outcomes in children and family. Research shows that suicide rates have been

increasing for men to the point that these rates have quadrupled in the past 25 years (Gunnell et al. 2000). The problem is that men often do not express what they experience and are less likely to seek professional help. Even when they do, men often do not report symptomology, and this makes the assessment difficult and inappropriate. Mental illnesses such as depression undermine the dominant expectations of masculinity, generating in men with depression a sense of inadequacy and powerlessness. For this reason, men tend to develop the so-called masked depression with masculine norm-congruent symptoms such as somatic pain, anger, hypertension, and violent behaviors (Cochran and Rabinowitz 2000).

Some men enter counseling voluntarily for seeking help with personal concerns, relationship issues, family dynamics, career situations, and various developmental, transitional, and, at times, debilitating crises (Mahalik et al. 2003). Other men do so in response to partner or family urging, or they are mandated by courts or human resource departments to attend counseling. Although the number of men receiving mental health services and counseling has been increasing in the last 10 years according to the Substance Abuse and Mental Health Services Administration (2012), men tend to be reluctant to seek help when experiencing distress, and they are more likely to experience isolation, which may result in greater mortality and lower quality of life (Bonhomme 2007). Societal expectations of masculine self-sufficiency can complicate matters for some men, making support seeking and sharing of personal experiences challenging. At the same time, making oneself amenable to support and appropriate self-disclosure is an important aspect of deepened intimacy and increasing well-being (Uysal et al. 2012). Therefore, developing these capacities is an important relational skill to explore in the counseling setting.

Secondly, the theme of male institutionalized privilege focuses on how gender power, patriarchy, and male hegemony shape our understanding of and approach to counseling with men. It

is grounded on the idea that “men, as a group, enjoy institutional privileges at the expense of women, as a group” (Messner 2000, p. 5). Though it does not refer to the totalizing and unchanging nature of men’s power and privileges, the theme concerns the institutionalized male power over women in political, economic, and religious realms. Men experience the problem in quite different ways, depending on their positions of power. As sociologist Michael Kimmel (1995) notes, “men’s pain is caused by men’s power,” but men are not often aware that they receive both benefits and pain from patriarchy.

The critical voices of family therapy have made theoretical and clinical contributions to address the issues of male power and privilege in family and marital relationships, particularly in the context of abuse and violence (Mirkin 1990; Goodrich 1991). Feminist therapy treats power as a continuous variable in one’s life and places “the empowerment of clients and the creation of feminist consciousness” as its main therapeutic goal (Brown 2009). In terms of general treatment goals, the counselor is expected to name power differential and inequality between spouses and stop the abusive behaviors in the offender, as well as in the whole family. While the counselor holds the offender accountable for modeling a different mode of power and caring, he or she should also be prepared “to support the offender’s mourning for the loss of his abusive power” (Goodrich 1991, p. 149). Feminist family therapists such as Michele Bograd (1991) translate feminist therapeutic practices into formulating effective clinical model for men. She argues that critical consideration of men is necessary for the family therapy to “be truly systemic” and to treat men as a significant agent for making changes in the family beyond the role of abusers and perpetrators of violence. She provides new ways of conceptualizing male development with attention to sensitivity to power issues and the social context and shifting cultural definitions of masculinity, femininity, and the nature of marriage. In this way,

feminist therapy takes a new look at roles and positions of men, as a way of reconfiguring the power relations within families and empowering women. With their own distinctive focuses, pastoral and practical theologians have also engaged the issue of how power relations and structures within the family can be reformulated and reconfigured (Miller-McLemore 1994; Neuger and Poling 1997; Browning and Miller-McLemore 2000; Wimberly 1997; Anderson 2004). To explore men's control and power needs can potentially interfere with the counseling process in combination with restricted emotionality. Thus, counselors are to exercise a great deal of skills and sensitivity with male clients as the counseling relationship may contain elements that challenge power or control-oriented males. At the same time, counselors themselves should consider their own needs for power, control, and competition in their therapeutic relationship with male clients.

Finally, the theme of differences and inequality among men addresses men's disproportionate share in power and privileges based on race, ethnicity, social class, sexuality, age, and immigrant status, specifically black, gay, immigrant, and working-class masculinities. This theme is premised on the recognition of hegemonic forms of masculinities, which are constructed in relation to femininities and to various marginalized and subordinated masculinities. In addition, the within-group diversity among men is vast; therefore, to increase their awareness of culturally and masculine-sensitive interventions, counselors need to become aware of the therapeutic and contextual variables that influence men's experiences. For example, in contemporary society the father comes in various forms; therefore, counselors should be open to and inclusive of fathers in diverse life circumstances and social locations. Today's father can no longer be understood exclusively as a traditional married breadwinner and disciplinarian. He can be single or married, externally employed or stay-at-home, gay or straight, and an adoptive or stepparent.

Pastoral theologians have raised a concern about men's struggle with changing expectations in various contexts of life. In their edited volume *the Care of Men*, Christie Neuger and James Poling (1997) take into consideration men who are located differently due to their social locations by introducing a womanist reflection on African American men along with an African American male theologian's perspective on men's movements, a feminist approach to pastoral care with working-class men, and a discussion of issues around pastoral care of gay men. It thus brings a corrective to the predominance of the white middle-class and heteronormative perspectives in this research trajectory. As a response to a lack of organized help and support for church leaders and congregations, they integrate womanist and feminist critiques of gender inequality into its inquiry into men and masculinity and explore theologically the possibility of creative cross-gender partnership and openness toward God's future. The muteness and invisibility of African American men in the broader society has been problematized (Wimberly 1993; Ellison Jr 2013). While acknowledging the complexity of geographic, socioeconomic, and educational diversity among African American men, Ellison Jr. (2013) examines how the reality of being unheard and unseen impacts their education, employment, and incarceration and how dehumanizing stereotypes and stigmatization of African American men could become a potential obstacle to meeting their basic human needs for "control, self-esteem, a sense of meaningful existence, and belonging."

Given multiple, intersecting factors that influence men's life, counselors are to take differences and inequalities among men into serious consideration in their therapeutic process because failure to do so homogenizes male experiences and loses sight of the reality that patriarchal dividends are not shared equally among all men but proportionally based on their social location. In considering counseling strategies and program efforts with men in a racially and economically marginalized status, counselors should be aware of cultural and

lifestyle factors that affect men as well as the diverse intersections of race, gender, social class, and age. Some of the problems, challenges, and needs of men originate from their individual lifestyles and manhood identity, while others arise from sociological and historical factors such as unemployment, racism, prejudice, and societal dehumanization.

Counseling Middle Eastern Arab-Americans

Naji Abi-Hashem
Seattle, WA, USA
Beirut, Lebanon

Introduction

People from Arabic and Middle Eastern background are as diverse as their countries of origin. They have been living and working in North America for many generations. Actually, some of them migrated to South and North Americas over a century ago. Currently, they represent a mosaic community of various groups, ages, educations, mentalities, customs, affiliations, values, and social classes.

Basically, the terms *Arab-Americans* and *Middle Eastern-Americans* refer to persons who consider themselves having an Arabic heritage at some level and who trace their roots to one or more regions of the Middle East and North Africa, known as *MENA*. Some consider themselves Americans with a distant Arabic lineage (among other nationalities) due to their mixed family background and cultural ancestry (Arab American Institute 2009–2015).

The term *Arab-Americans* is prevalent in the literature, yet it can be too broad or confusing at times, as there is no defined single *Arab world* or one unified and homogeneous Arabic people located in a well-confined geographical area. Actually, the Middle East is a vast region and has a rich history, many cultures, and abundant traditions. It contains multiple ethnic, linguistic, religious, and cultural diversities. It is the birthplace of three major religions – *Judaism, Christianity, and Islam* – and the crossroad of numerous great civilizations (cf. Barakat 1993).

The word *Arab* has *Semitic* roots. *Arabian* refers to the original people who inhabited the Gulf Peninsula, way before Islam came to the scene! Presently, Arabic-speaking countries

spread wide from the East Mediterranean to the North African shore and, at times, reaching deep within the African continent (Sudan, Somalia). Currently, the Middle East and North Africa societies accommodate a wide range of mentalities and social norms – from the highly urban, complex, and progressive lifestyles to the highly rural, tribal, and traditional lifestyles (and everything in between) (cf. Abi-Hashem 2011a, 2012, 2014; Nydell 2012).

Arabic Speaking Nations

Officially, there are 22 nations that consider Arabic as its main language. They are distributed geographically into five distant regions, known as Maghrib, Northeastern Africa, East Mediterranean, Arabian Peninsula, and Arabic-Persian Gulf (Nydell 2012). The nations, as listed alphabetically, are Algeria, Bahrain, Comoros, Djibouti, Egypt, Iraq, Jordan, Kuwait, Lebanon, Libya, Mauritania, Morocco, Oman, Palestine, Qatar, Saudi Arabia, Somalia, Sudan, Syria, Tunisia, United Arab Emirates, and Yemen. These nations are part of the *Arab League*, or the *League of Arabic Nations*, which is a loose organization connecting these countries together without any major authority or governing power. Classical Arabic is the formally written language and is spoken and can be understood across the region. French and English are common second languages, but other dialects exist as well. Besides some shared values, cultural norms, and basic religious practices, along with perhaps a collective memory of their place in history and rootedness in the land, there are actually not too many common factors among these countries and communities. Some of them enjoy a beautiful landscape along the seashore of the Mediterranean; others have mountains or flat lands and deserts. However, each local community has its own way of life, spoken accent and dress code, mood and temperament, and local habits and customs (Abi-Hashem 2011a, 2012).

Waves of Immigrations

There were two major waves of immigrations from the East Mediterranean to North America: the first wave was around the last part of the nineteenth century, and the second wave was at the end of World War II. Early immigrants were descendent of the Christian communities mostly from Lebanon and Syria. Presently, about four million Americans trace their origin to one or more Arabic country. However, those from Muslim background are almost double this figure, about eight million, known as *American-Muslims*. It is important to remember that although the majority of the Arabic Middle East and North Africa (MENA) are religiously and culturally Muslims, the largest concentrations of Muslim communities exist outside the MENA area, namely Indonesia, Pakistan, India, and other Southeast Asian countries.

An American person or a group with an Arabic and Middle Eastern background is someone who is connected to the Arabic language and culture. This relationship can be as distant as a 3rd- or 4th-generation, US-born to a multinational and multicultural family, or as fresh as in a newly arrived immigrant. Many Americans who have a little trace to the Middle East may not relate well to other Arab-Americans because they do not feel they have many things in common in terms of backgrounds, social experiences, worldviews, and lifestyles, similar to how a 4th- or 5th-generation Italian, German, Irish, Hispanic, or Greek feels and acts toward their traditional roots or countries of origin. Although Middle Eastern Arab-Americans have been living and working in the United States for generations, they are not considered as a separate minority yet, but generically classified among the white (non-Europeans) ethnic groups. The majority of this population is young, thriving, educated, and entrepreneurial in orientation (El-Badry 2010). Some of them are accomplished professionals and academicians in many fields and have made significant contributions toward the American society through the years (see Arab American Institute 2009–2015).

Adjustment and Adaptation

However, like any other migrant and minority groups, the more recent settlers and refugees, as well as the older generations, face hard times in acculturating and assimilating within the new hosting culture. Expanding identities, balancing nationalities, integrating worldviews, and reconciling differences are not easy tasks, especially when the cultural gap is large and the adapting skills are minimum and few. At times, children and teenagers become torn between the home-family subculture and the peer-society subculture; therefore, they tend to live a life of mental-emotional splitting and function in two psychological modes (cf. Abi-Hashem 2013a; Abi-Hashem and Brown 2013; Adida et al. 2016; Al-Hazza and Bucher 2010; Paterson and Hakim-Larson 2012).

According to the Arab American Institute (2009–2015), the percentage of the religious affiliation of Americans from Arabic and Middle Eastern descent is roughly distributed as follows: 25% Muslims – Sunnis and Shiites, 35% Roman and Eastern Catholics, 18% Eastern Orthodox, 10% Protestant, and 12% with other affiliations or no religious faith affiliation at all. Other sources, however, reflect a more equal percentage of population between Muslims and Christians (50%) in the greater North American continent. That is more probably the case since more people are migrating recently from Muslim communities around the Middle East and North Africa, for various reasons. They also tend to have a higher birth rate and belong to larger immediate and extended families, compared to the average Western household (cf. Dhami and Sheikh 2000).

Confusion and Anxiety

Although there is some awareness and understanding in the West about the various cultures and religions in the Arabic Near East geographical area, still yet there is a lot of uncertainty and confusion about who are the Arabs, the Muslims, and the Middle Easterners. Therefore, it is important to correct any misconceptions or generalizations and to clarify the similarities and differences

among these labels: (a) not all Arabs are Muslims, since there are significant minorities like the Christians, Jews, Druze, and Alawites who are spread out in the region and have been there for many long centuries; (b) not all Middle Easterners are Arabic-speaking people although they deal with Arabic neighbors very closely, e.g., Turkey, Iran, Cyprus, and Israel; (c) not all Arabic people are Middle Easterners, as is the case of the vast North African countries from Egypt to Morocco; and (d) not all Muslims are Arabic or Middle Easterners either, since the largest concentration of Muslim population is found in Southeast Asia, in countries like Indonesia, Malaysia, Afghanistan, India, Pakistan, and other nations around the world, e.g., the former Soviet Union regions of Asia (cf. Abi-Hashem 2008, 2011a, 2014; American Psychological Association 2008; Jackson 1997; Zogby 2010).

Similar to other people of faith, Muslims can be practicing, devoted, and faithful or simply nominal, cultural, and even secular. There are also various branches and denominations within Islam, which provides room for diversity as well as for division among its population. Since the start of the War on Terror many people in the West, especially those from Arabic and Muslim descent, became real nervous and anxious, so they tried to keep a low profile. Some of them changed their first or last names to avoid sounding more Arabic or Islamic in kind. However, others never felt any negative impact from such polarization, and they kept their lives and activities as normal. Virtually, when counselors and caregivers work with people from Arabic Middle Eastern heritage, it is important to find out about their cultural backgrounds and religious identities, as well as the degree of easiness versus awkwardness they may feel while living and functioning in the hosting society.

Multi-identity and Values

In the Middle East, the religious identity of people is part of their social identity. Unlike in the majority of the West, the relationship between what is religious-spiritual and what is

communal-social is complimentary and intimate. A total division or complete separation between the two spheres is not the norm and rather unnatural. However, people in urban settings function professionally and effectively in their field of specialty yet do not lose track of their sociocultural heritages and religious traditions, as they move in and out of that mode quite easily. They can readily incorporate and celebrate their traditions within short notice. Mentioning God and using religious generic blessings are routine ingredients of any social greetings, common responses, and personal exchanges, regardless of the person's religious background, affiliation, or commitment, e.g., *Inshallah* (God willing), *El-Hamdellah* (thanks be to God), and *Allah Maak* (God be with you). For Arabic Middle Eastern people, the term *religion* has many connotations, dimensions, and roles. It could mean or refer to religious *faith* and personal *spirituality*, to religious *tradition* and *customs*, to religious *affiliation* and *association*, to religious *doctrine* and *theology*, to religious *values* and *morality*, to religious *practices* and *rituals*, to religious *culture* and *community*, etc., or a combination of some or all the above (cf. Abi-Hashem 2011a, 2013b, 2014; Pew Research Center 2013).

Variation and Diversity

Americans of Arabic and Middle Eastern descent are quite different from each other. Some are outgoing, competent, and fully integrated, and then less distinguishable from their average American counterparts, while others are reserved, unconfident, very traditional, and reluctant to merge within the hosting culture. Usually fresh immigrants, refugees, and older adults struggle more with emotional regulation and cultural adjustment. The challenges they face are huge – learning a new language, functioning within a new system, navigating a new environment, and maneuvering new sets of freedom and responsibility – all the while keeping their uniqueness and staying loyal to their foundational values, cultural traditions, and religious faiths. Many of them have

arrived from regions torn by wars, famine, persecution, sociopolitical turmoil, armed conflict, and violence. Their painful memories and emotional scars are still fresh, which make them highly vulnerable and prone to severe anxiety, grief reaction, traumatic stress, and marked depression. They certainly need special care and attention in the forms of cultural coaching, therapeutic presence, and clinical counseling (Abi-Hashem 2011a, b, 2014; Abi-Hashem and Barbuto 2013; Amer and Hovey 2005; Hakim-Larson and Nassar-McMillan 2008; Zogby 2010).

Counseling Approaches and Guidelines

There are some great resources available for the helping professionals who are working with individuals and families of various types and different ages from Arabic Middle Eastern backgrounds. The following guidelines are samples of the many insights, tools, and approaches that providers, counselors, educators, and caregivers will find in the existing literature to help them gain better understanding, acquire better awareness of the others and of themselves while in the process, and achieve better cultural intervention so they may increase their competency skills and counseling effectiveness (cf. Abi-Hashem 2008, 2011a, 2013a, c, 2014, 2015; American Psychological Association 2008; Dwairy 2006; Erickson and Al-Timimi 2001; Jackson 1997; Kobeisy 2004; Nassar-McMillan et al. 2010; Robinson-Wood 2016; Soheilian and Inman 2015).

Inquire gently and take time to build trust and warmth in the therapeutic visit. The majority of Middle Easterners expect friendly encounters and do not respond well to mechanical, business-like relationships, or to quick diagnoses and interrogative-type of evaluations.

Be faithful to what you learn from them as they expect you to honor that personal information entrusted to you.

Discover what generation they are (e.g., 1st, 2nd or 3rd) and help especially the newcomers to adjust and function well within the hosting society.

Do not interpret some of their silence or aloofness as resistance. Many are not familiar or comfortable with counseling or the therapeutic professions.

Find out the nature of their cultural identity and degree of religious affiliation or commitment, and how these factors presently impact and inform their coping and adaptation.

Guide immigrants to deal with any emotional residuals or unresolved issues they may carry with them from their homelands and acknowledge the hardship of acculturation they may face as well as the pleasant aspects and adventures they are experiencing in their adopted world.

Assist them to sort through their beliefs and lifestyles and then integrate some of their values, religious traditions, and heritage with the demands of the new hosting society, and what do they need to really modify or begin to phase out gradually.

Most elderly and traditional people look up to the educator, therapist, or caregiver as an expert and as a person of authority. They expect direct involvement, structure, guidance, and lively interaction (include assignments, homework, and practical exercises).

Facilitate the resolution of any inter- and intra-cultural tensions or stresses that they may be experiencing on the intra-psychical, interpersonal, and inter-cultural levels.

Guide them to formulate a sound cultural self, expand to a multi-dimensional identity, and utilize any communal and religious resources available in their personal life and ethnic-group circle.

Assist them to maintain healthy family connections and intergenerational continuity but not to the extent of isolating themselves from the larger hosting society. Some tend to either alienate themselves or immerse themselves fully to the degree of total fusion (two extremes).

Help them navigate smoothly through the cultural intricacies and nuances of the many American lifestyles and mentalities. Thus, they can function and relate to others well, be productive members in society, and achieve a better inner-and-outer harmony.

Countertransference

Pamela Cooper-White
 Union Theological Seminary, New York,
 NY, USA

Countertransference is the response, mostly unconscious, of a therapist, counselor, or other helper toward his or her patient, client, or helpee. In classic psychoanalytic theory, it is understood to manifest as distortions in the helper's perceptions of the helpee and at times irrational responses and behaviors toward him or her. In contemporary psychoanalytic and psychodynamic theory and practice, it encompasses all the thoughts, feelings, fantasies, reactions, dreams, bodily sensations, enactments, and other responses of the helper toward the helpee.

The term originates in relation to the complementary concept of the transference. Transference, first defined by Sigmund Freud (1912/1958a), is the unconscious mental activity in which the patient unconsciously ascribes – or transfers – thoughts, feelings, motives, and behaviors from his or her own inner world, usually based on repressed experiences of one's parents from earliest childhood, onto the therapist or helper.

Transference and countertransference form a complex dynamic between helper and helpee, in which interlocking projections, mutual identifications, and counterreactions can increasingly create a multi-textured unconscious relationship that has immediate (but often unrecognized) impact on the conscious relationship.

Traditionally, in Freud's formulation, the countertransference was considered to be hindrance to treatment, which depended on rational, clear-eyed, and reality-based diagnosis of the patient's irrational difficulties (1905/1953, 1910/1957, 1915/1958b). A therapist who had undergone his or her own thorough analysis was thought to be able to set aside irrational thoughts, feelings, and impulses and to maintain a calm, ego-controlled view of both him/herself and the patient – even (although Freud honored this mainly in the breach) “the emotional coldness of a surgeon” (Freud 1915/1958b). Countertransference in such a schema was considered to be a contaminant of rational diagnosis and a hazard to treatment. It had its origins in the therapist's own unresolved inner conflicts and repressed wishes, which required further analysis to “manage” the countertransference. Freud was strongly invested in this definition of countertransference, because it came to his awareness primarily through colleagues' giving in to sexual temptations in the face of patients' erotic transferences toward themselves – most notably C. G. Jung's intense relationship with his patient Sabina Spielrein (Carotenuto 1982). Freud's technical papers on transference and countertransference were written in response to the fear that the reputation of psychoanalysis – already under siege – could be permanently damaged if such sexual scandals and exploitation of patients became widespread.

As the concept was developed, it came to be understood as containing the influence of the patient's unconscious. Melanie Klein (1946/1975, 1952/1975), an analyst in Freud's circle and eventual founder of an offshoot of psychoanalysis called “object relations theory,” noted that the patient could invoke or implant intolerable affects, fantasies, or other unconscious material in the therapist, who then would identify with it – a complex mechanism termed “projective

identification.” Another later analyst Heinrich Racker (1968) considered the countertransference to be a kind of mirror reaction to the transference of the patient, which could manifest as either “concordant” (aligned empathically with the patient’s transference) or “complementary” (discordant with the patient’s transference).

In these theories, like Freud’s, the countertransference was still largely viewed as a distorting element that could impede the therapist’s view of the patient and therefore interfere with the treatment. However, more positive or expansive views were also being developed alongside Freud’s orthodoxy. As Jung developed his own mode of “analytical psychology” after the break with Freud, he also examined transference phenomena, viewing the countertransference (a term he seldom used *per se*) not only as the analyst’s internal conflicts and neurotic distortions at the level of the ego but as a well of access, via the transpersonal self, both to the patient’s archetypal material – even with the danger of becoming possessed by it – and the collective unconscious, an archetypal layer of shared human memory that could be tapped by both analyst and patient alike (Kraemer 1989). Jung’s writings on the unconscious and the subjectivity of the analyst (e.g., 1916/1928/1966c, pp. 286–290; 1916/1967, p. 87), on the therapeutic relationship as a dialectical process (1951/1966a, p. 116), and his image of the transference relationship as an alchemical bath in which both therapist and patient were immersed (1946/1966b) anticipated the more expansive contemporary view of countertransference by several decades. Freud also split with his Hungarian follower Sandor Ferenczi primarily over Ferenczi’s (1933/1955) insistence on “active technique,” in which close scrutiny of the analyst’s countertransference could yield important emotional data about the patient and might also be disclosed to the patient.

In the 1950s, a more positive, or at least useful, understanding of countertransference began to be accepted. Paula Heimann, a patient and student of Klein’s, was the first to fully formulate a definition of countertransference as not only containing neurotic traces of the therapist’s own unresolved internal conflicts but receiving unconscious

affective material from the patient via projective identification (Heimann 1950, 1960). This view was echoed in D. W. Winnicott’s (1949/1992) somewhat controversial essay “Hate in the Countertransference.” This view was taken up and became commonplace among British analysts from the mid-twentieth century onward, although it was primarily used as such only among Kleinian and object relations analysts (e.g., Bollas 1989; Casement 1986, 1992; and the American Kleinian Thomas Ogden 1994, 1997).

During mid-twentieth-century debates within classical and object relations schools of psychoanalysis, Otto Kernberg (1965) offered a summary of the two definitions within American psychoanalysis, distinguishing between the classical Freudian definition and his term “totalist countertransference,” i.e., countertransference as the sum total of the therapist’s reactions, conscious and unconscious, to the patient. However, the expanded definition did not come into common usage nor was countertransference a heavily investigated research topic in other branches of psychoanalysis until later in the twentieth century. Meanwhile, interest in the therapist’s subjectivity continued to grow, especially through Heinz Kohut (founder of Self Psychology, a significant offshoot of classical psychoanalysis in the latter half of the twentieth century) and his investigations into empathy as a form of “vicarious introspection” into the patient’s psyche and illuminating the patient’s self structure (e.g., Kohut 1971, 1982).

In contemporary psychoanalysis, countertransference came once again to the forefront of theory and technique through a new interest in intersubjectivity and postmodern paradigms of the permeability of self and other. Recent attention to the treatment of post-traumatic stress also heightened clinicians’ awareness of countertransference as a two-edged sword – both dangerous and also empathically informative – as split-off traumatic material is experienced by the therapist himself or herself, sometimes in the form of “vicarious traumatization” (Dalenberg 2000; Davies and Frawley 1994; Pearlman and Saakvitne 1995). Countertransference is now increasingly understood in its more comprehensive and positive

definition. In current usage in most schools of psychoanalytic thought, countertransference and transference are generally understood as a continuum of conscious and mostly unconscious relationship, in which thoughts, feelings, fantasies, and impulses exist in a shared unconscious pool of intersubjective relationship. This view has been examined through extensive theoretical writing and case studies by writers in the relational psychoanalytic school (with its beginnings in New York, e.g., Davies 1994, 1996; Mitchell 2000), the intersubjective theorists emerging from Self Psychology (e.g., Stolorow et al. 1995, 2001), other Euro-American theorists (e.g., Loewald 1986), and some modern Jungians (e.g., Samuels 2003; Sedgwick 1994). This usage has spilled over into virtually all psychoanalytic and psychodynamic practice to date (e.g., Gabbard 1995; Gabbard and Wilkinson 2000; McWilliams 2004; Stevens 1986). In consideration of therapeutic ethics, enactments are considered inevitable in this understanding, not entirely preventable, but the therapist's maintenance of safe boundaries is still critical – not for the sake of neutrality per se, but because unanalyzed enactments can become collusive, harmful, and out of control. The asymmetry of roles and responsibilities between helper and helpee requires continued introspection and interpretation.

The relevance of countertransference for the psychology of religion is perhaps most closely seen in its fairly recent appropriation into pastoral psychotherapy and pastoral counseling (e.g., Collins 1982; Cooper-White 2004, 2007; Stengl 1996; Wagner 1973). As interest has shifted back toward psychodynamic and psychoanalytic paradigms, especially in their more contemporary iterations, the concepts of countertransference and intersubjectivity have been reintroduced to the practice of pastoral care, counseling, and psychotherapy (Cooper-White 2004, 2007). Countertransference is also of interest in consideration of treatments in which therapist and patient have differing or even conflicting religions, theologies, and/or God-images (Cataldo 2008). Ana-Maria Rizzuto's (1981) work on the significance of

individuals' God-images for understanding their inner object relations is as relevant in the countertransference as in the diagnosis and treatment of patients. The work of Henry Corbin, a French philosopher, theologian, and scholar of Sufism, has been read by Jungian analysts to connect themes of countertransference, the analyst's subjectivity, and Corbin's *mundus imaginalis* that underlies the spiritual imagination across cultures and religious traditions worldwide (Samuels 2003). Investigations into the countertransference as a central dimension of intersubjectivity have perhaps begun to open new avenues for the exploration of psychology and religion in a more phenomenological or Jamesian vein – i.e., the study of the variety of unconscious and intersubjective religious experiences among contested and multiple subjects and their g/Gods.

Couples, Marriage, and Family Counseling

Steven B. Herrmann
Oakland, CA, USA

The typical problems patients bring in for couples, marriage, and family counseling can be broken down into eleven primary categories: (1) sexual problems related to lack of intimacy; lack of desire and attraction; feelings of rejection, hurt, betrayal by a partner; traumatic histories of abuse and trauma causing dysfunction; internet pornography addictions, extra-marital affairs, polyamory; etc.; (2) intimacy and communication issues; partner is not expressive of emotions or feelings; (3) financial problems related to economic stress about the purchase or selling of a home; moving to a different location; travel, school, and career issues; (4) domestic violence, including sexual, physical, and emotional abuse; (5) substance abuse; alcohol, marijuana, cocaine, and other drugs; (6) religious conflicts in multicultural marriages; (7) how are the children to be raised, schooled, and disciplined; (8) parent-child relational problems; children's school-related issues; problems with drugs, disrespectful attitude towards adult authority, and peer group problems; (9) lesbian, gay, bisexual, and transgender counseling (LGBT); (10) premarital counseling; and (11) assessment of emotional disturbances such as anxiety and depression.

All of the above can be addressed through modeling of healthy communication skills, mirroring, and vocational assessment, as problems in relationship are often related to developmental issues, spiritual growth, in preparation for mid-life and old age, search for meaning, and the final acceptance of the reality of death. Most of the above symptoms or complaints can be fit into criteria of neurotic conflicts; at bottom, they center on questions of purpose in life. The solution of problems for each individual member of a couple, marriage, or family can relieve neurotic suffering and symptomatology in the working relationship if the self-esteem of each person is valued and nourished. Absence of playfulness and lack of

affect-attunement and insecure attachments are often at the roots of such problems; their roots go deep into childhood patterns, emotional injuries, isolation, loneliness, or loss of connection to Eros. The yearning for delight, happiness, and expansion, which couples and family members often do not get enough of, is sometimes sought in meaningless diversions, noise, and unsatisfying TV shows, rather than finding ways to enhance pleasure and peace in the partnership, or family connections, via quality time together in sports, camping, hiking, going to the city, or enjoying recreation in Nature.

The aim of the Counselor is to help heal emotional wounds, redirect conversation towards family system cohesion, set limits, and enhance laughter and meaning. Increasing appreciation for the gifts that couples can celebrate and feel gratitude for together is a primary part of the work. Also, chief amongst counseling goals is breaking down defenses that have hardened into anger, resentment, or patterns of withholding, so that the creative freedom to live life more fully can be made readily available. This requires a considerable period of discharge of toxic emotions, expressing and verbalizing negative feelings, and learning how to fight fairly or agreeing to disagree, settling for differences, or, if need be, divorce. This is why premarital counseling is so important, with a divorce rate above 50%, to avoid the anguish and tragedy of separation and the excruciating pain of divorce. Premarital therapy can help prevent such a possibility by allowing the couple to work out conflicts *before marriage* and carefully assess the relative healthiness or sickness of the partnership.

By letting go of the ego in the larger interests of the Self in the relationship between couple, married partners, or family members, patients may be reconditioned to come to see Love and connection as the main matter in the quest for spiritual fulfillment.

Amongst the most popular forms of counseling techniques to deal with couples issues today is Imago therapy created by Harville Hendrix (1988). The basic notion of this therapy is that we were all born whole, but became wounded during early development by primary caretakers. More, such injuries created a composite of pain in

the personal or family unconscious that forms an Imago. Through the analytic dialogue, the Imago may be examined to help the couple work through unfinished issues from the family of origin that are standing in the way of completeness. This is one way of approaching such issues. But the theoretical foundation, on which the Imago is based, although often left unstated, is *Jungian*.

Jung (1953–1979) began his exploration into the empirical nature of affect-images (complexes) in Switzerland, and his ideas have had a large impact on the shaping of the analytical field. Complexes (affect-images) are formed through developmental trauma that splits off bits of the personality, which then forms an emotional core surrounded by affect that cannot be integrated into consciousness and creates an affect-image that may proliferate into mental disorders, dysfunctional behaviors, or enactments in individuals, families, or groups. This is what Harville Hendrix calls an Imago. To be depleted of their negative emotional charges, complexes (affect-images) need to be transformed through the reductive (regression to early childhood) and constructive (creative and future oriented) methods of analysis, fantasy-thinking, and symbolic language, sometimes employing methods of the expressive arts and sandplay. Typically complexes are experienced in the analytical matrix through projected *relational images*, and the task of the psychotherapist is to take them in and work with them in the analytic dyad, the therapist-patient relationship. Interpretations are based on what is being felt and experienced in the *attunement/mis-attunement patterns* between dyads or triangular arrangements. Once the complexes are stripped bare to the bone – to their causal origins in each person's adolescence, childhood, and early infancy – if all goes well, a natural outgrowth of personality for each individual member in the treatment may happen.

The Jungian Marriage and Family Counseling method is a clinical practice that is used by many practitioners worldwide who utilize Jungian/post-Jungian concepts to guide their psychotherapy practices. "Post-Jungian" services are rendered according to clinical education, training, and experience requirements that include various

counseling fields of clinical licensure or other educational certification tracks.

What do Marriage and Family Counselors have to offer the field of empirical psychology that other mental health practitioners typically do not provide in their wide range of clinical services? The main difference is the focus placed not on an Imago but on many *imagoes* in the personal, cultural, and transpersonal psyche; on a full assessment and evaluation of the regulative functioning or malfunctioning of myriad affect-complexes (or affect-images) and fantasy systems, coupled with an examination of future oriented dreams, as central channels for the Self's emergence, in the family/couple/marital matrix. The Self, as the central archetype, or blueprint of wholeness in the human personality is Jung's master concept for the main image (or Imago) of organization in the personality operating in marriages, partnerships, or families. Self-representations may be recognized and interpreted in the analytical container and allowed to unfold in known and mysterious ways over time. It is also by working with interpretation of psychological types in each individual that post-Jungians tend to excel as clinicians. The main instrument for assessing psychological types is the Myers-Briggs Type Indicator (MBTI) (finding your blend of extravert, introvert, sensing, intuitive, thinking, feeling, judging, and perceptive types) and other relevant instruments.

Post-Jungians have an ear for *affect-attunement* and *affect-misattunements* and the aim of the therapist is to listen to and identify emotional tones in the verbal and relational communication patterns between the couple, married pair, or family members and trace the health or illness of these styles of communication back to their emotional sources in the family of origin, extending back several generations. Once couples, dyads, or triads can see how they are attempting either to master or perpetuate old systemic conflicts arising from the families of origin, sometimes going back beyond the parents to the grandparents and great grandparents, they can begin to let go of dysfunctional styles of interacting and begin to sacrifice their ego-driven ways of relating to one another, in the

interests of the larger needs for dyadic or group transformation. Post-Jungian Marriage and Family Counselors *listen* to currents of emotion and image that pass freely back and forth in communication patterns and form the chief sources of information for consciousness-creating narratives, used by the clinician in psychotherapeutic treatment.

The methods of complex analysis, dream interpretation, art, and active visioning techniques, not typically used in mental health institutions, may be utilized. It is also useful to explore creatively the personal and collective myths of the family members or couple. But by far the most commonly used technique in couples work is the teaching of active listening and the therapist's use of himself or herself as a witness to change cognitive, behavioral, and emotional patterns. Often this requires a painful stripping away of defenses and a painful sacrifice of the ego through the therapist's confrontation of neurotic styles. By returning patients in treatment to childhood through regressive work, patients may be enabled to allow personal complexes to surface along with creative patterns of destiny, which have been neglected or split off from the Self's total functioning, and this may happen through the therapist's directing the patients to keep a careful record of their dreams.

Dreams of a prospective nature may then emerge. Such dreams (or daydreams) tend towards a center, the Self, and their purpose is goal directed. The fundamental basis of such rational work, whether with children, adolescents, adults, couples, or family, is linguistic and poetic at its foundation. Reflecting on the meaning of symbols is one way the emotionally toned complexes may be made self-conscious. (In the language of psychodynamic, or family of origin systems theory, such complexes are referred to as introjects.) Whatever the language used by the practitioner, image-based therapy is a primary vehicle for understanding a dream's, misunderstandings', or the symptom's meanings.

As the reader can see from the foregoing statements, the importance of the analysis of complexes or affect-images stemming from early childhood is of the utmost importance for the

success of a couple, marriage, and stability of a family. The skilled practitioner is equally skilled at working on separation and divorce issues, which includes helping couples deal with grief, loss, anger, or a visitation plan that may involve the following of a court order in conjunction with guidance from a mediator.

Premarital counseling serves to address *potential* problems before they arise in a marriage and is highly recommended today in work with all partnerships, including same-sex arrangements. Agreements need to be made between couples regarding difficult issues, and in order to arrive at agreements, compromises often need to be struck. By shining a light on areas of difference before contractual arrangements become legally binding, couples are in a better position to assess the capacity of the partnership for change.

Finally, I will briefly cover the field of family therapy. Family therapy, as indicated above, involves an analysis of the total relational matrix. This means taking the focus off the identified patient and looking at the entire system, including, if relevant, the sibling dynamics of each individual in treatment and birth order. One of the Family Counselor's chief tasks in this work is to establish an immediate connection to the child or children in treatment so as to build trust and an open line of communication to the unconscious of the child centered on their emotional conflicts. Behavior problems and academic problems in children often have to do with a problem of improper mirroring by the parents and alliances need to be made to form an attitude of equality in the room, while supporting the parent's role as authorities. Teaching parenting skills is a part of this work. Another task is to assess the stability of the child within the family matrix and to open up lines of communication between the child and the adults involved in the child's treatment. When working with an adolescent, such an assessment sometimes requires working with both parents in a divorced family, where the aim of the clinician is to try and establish as best as possible a collaborative relationship between the couple and to push the parents who sometimes are in disagreement about such concerns as discipline and where the child should live or what kinds of privileges will be

assigned to agree on the treatment goals of the family.

The Couples and Marriage Counselor is faced with the unenviable task of having to make the family darkness (evil) conscious, which places not only the child but also the parents on the hot seat. This is a true act of modesty on the therapist's part that requires that she remain open to her wounds. This modality of healing is structured by the wounded-healer archetype. The MFT has chosen her profession from a fateful predisposition that calls her to this work. This lessened hierarchal approach brings a compassionate and respectful attitude to the treatment and a safe container for difficult issues to be confronted and for transformation and change to occur.

Covenant

Francis Benyah
Abo Akademi University, Turku, Finland

Historically, the word “covenant” has both political and religious antecedents. Its earlier usage has been linked more to the ancient Near Eastern treaty traditions which go back to the Hittites and remained central in neo-Assyrian imperial

politics (Schaper 2015). Such treaties, especially the vassal treaties, have been shown and/or argued in contemporary literature to have deeply influenced the Israelite concept of *berith* (Schaper 2015; Douglas and Tenney 1987). The biblical word *berith* often translated covenant which formed large part of the book of Deuteronomy “oscillates between the notion of the contractual and that of obligation or self-obligation” (Schaper 2015, p. 365). In the Hebrew Bible, there are four kinds of covenants, namely: the Noahic, the Abrahamic, the Mosaic, and the Davidic (Gn 8–9, 12:1–3, 17:1–14; Ex 19:5–6; 2 Sm 7:12–16). As argued by Schaper (2015, p. 365) “The notion of covenant is central to the Hebrew Bible and became the focus of the Jewish conceptualization of relations between the Jewish people and its God; it entered the bloodstream of Christian theology in the times of the early Church and became even more important in pre-Reformation and Reformation period” through the vernacularization of the Bible leading to its wider audience and impact on public imagination. Essentially, the meaning of the word covenant in whatever context it has been used denotes an idea of contractual relationship between two or more people, usually agreeing on promises, stipulations, privileges, and responsibilities. It is quite commonly used in legal, social (marriage), and religious and theological contexts. In political circles, the word treaty is preferably used rather than covenant.

Covenant and Psychology

In terms of its psychological imploration, covenant is predicated on habit: a sense of obligation to consider the interest of others in decision-making and a commitment to do so that is not easily or unilaterally broken. In that regard, understanding the meaning of covenant and its associated expectant behavior on the part of parties involved as well as the transformation derived from it is a goal central to the heart of the discipline of psychology. This is because at the heart of the discipline of psychology is studying how human beings change, develop, or relate

to their environments and social relations. Behavior in the context of human subjects has been explained to mean a “conscious and purposeful activity that can be evaluated in terms of efficacy, morality and responsibility” (Carpintero 2015a, 158). Behavior has been shown to be an integral part of the discipline of psychology. Thus behavior is “the defining object of scientific psychology” (Carpintero 2015b, p. 162). Covenant has the proclivities to reinforce and induce social and moral behavior. In simple terms, covenant has a linkage in constituting the order and shaping the moral psychology of parties involved in any agreement whether religious, economic, or political (Malik 2017). For instance, Rothman (1980) has examined the relationship between covenant and contract theories and the implication of this nexus for American constitutional theory.

In the lives of the Jewish people, for example, denouncing God and not obeying His rules meant a broken of a contractual agreement between the people and their God that always had a consequential effect, with example of going into exile. In the context of social relationship, for example marriage, the binding agreement of remaining to but one wife means that any promiscuous lifestyle on the part of any of the party involved in the marriage could lead to breakdown of the relationship. Hence, such binding agreement provides a context in living out a conscious lifestyle that does not negate such agreement. In legal and political treaties or agreement, parties involved in the agreement are required to adhere to certain regulations and practices that do not flout the lay down rules and regulations. These regulations and agreements produce inherent character traits that subvert any negative effect on the social lives of the parties involved (Polischuk 2016). Thus covenantal relations can be viewed from meta-cognitive fashion. Individuals in any form of agreement engage in meaningful and mindful behavior to actualize their goals and capacities in a covenantal mode.

In sum, the discipline of psychology is intertwined with the examination of human behavior. In the psychology of religion, the idea of covenant relates to the understanding of the

value and importance of utilizing religious resources to instill and ensure behavioral patterns.

Creation

Rod Blackhirst
Philosophy and Religious Studies, La Trobe
University, Bendigo, VIC, Australia

In a religious context, the word “creation” refers to the cosmogonic moment or cosmogonic process or else, as a noun, to the manifest world. In modern terminology, we might speak of the former as the formation of the world or universe (usually in scientific terms from the “Big Bang” or some similar cosmic event) and the latter as the “environment.” In prescientific worldviews, it was usual to hold that life, humankind, the Earth, and the heavens were created in their original form by the action of a deity or deities, and the

world at large was referred to as “the Creation,” the product of that Divine act.

The modern scientific worldview, and especially the theory of evolution, has undermined the simplest versions of these traditional beliefs, but religious people still understand the origins of the world and humanity in mythic terms, often along with rather than as antithetical to the scientific worldview. However, among some people these matters are still controversial and they insist upon a literal understanding of religious creation myths along with the outright denial of scientific theories. This view is usually styled “creationism.” Conversely, believers in the scientific accounts of the origins of man and the universe often regard these as a conclusive refutation of traditional religion and the existence of God. This controversy has been especially acute in the United States where proponents of creationism have challenged the teaching of evolution as an unquestioned truth in schools. Such proponents are usually guided by a literal reading of the account of the creation of the world in the Bible’s Book of Genesis.

Leaving aside literalist creationism, traditional religious and spiritual cultures use myths and symbols to explain the great mysteries of life. Mythic and symbolic accounts of creation abound. The creation may be a deliberate act by the gods or it may be the result of an accident or miscalculation. It may occur in stages, as in the Genesis account of creation over 6 days, or it may take place in a single act, as in the Islamic account where God (Allah) merely makes a decree (kun = the verb “to be”) and it comes to pass. The creation may stem from nothing (creatio ex nihilo) or it may be presented as order being brought to preexisting, chaotic materials. It may be regarded as a gratuitous act by the Divine in which case the creation is said to be utterly other than the deity or it may be regarded as an act of Divine self-disclosure or self-externalization (emanationism). Very often in mythological forms found throughout the world, the creation is the result of a sexual, generative act such as the copulation of a sky god with an Earth Mother or sometimes by an autoerotic (masturbatory) act by a single deity or else instantaneous parthenogenesis. In other cases, analogies are taken from the

animal realm, such as the primordial “world egg” of the Orphic cults of ancient Greece. In some traditions, a primordial god vomits up the creation or it results from some other bodily elimination.

In more philosophical cosmogonies, the root of creation might be sound or it might be light, it might be auditory or it might be visual. In the Hindu, Jain, and Buddhist religions, the creation extends from the sacred, primordial syllable AUM (Om) which, like a seed, contains all things within it. Similarly, in Christianity, the Gospel of John proposes that “in the beginning was the (Divine) Word.” Alternatively, in many myths, there is first darkness and the creation comes about when a light (or fire) is kindled in the darkness; the darkness is dispelled and the forms of the world appear. The idea that light is the creative stuff of the cosmos is very ancient.

There are, in any case, countless variations and often diverse accounts within the same tradition. In the ancient Egyptian tradition, for instance, there were numerous creation myths existing side by side and it would be wrong to suppose that the Egyptians favored any one more than the others; each reveals different understandings that are complementary to each other and presents different aspects of a total theology. Even in the Bible’s Book of Genesis, textual scholars identify two accounts of creation taken from two earlier sources. In fact, the familiar account of creation over 6 days with which the Book of Genesis begins (called the Priestly account) is the latter of the two. The older account, now embedded in the second chapter of Genesis, is the story of the creation of the garden of Eden and of Adam and Eve. Some reckon the story of the Flood as another type of creation myth taken from Mesopotamian sources now found woven into the Biblical narrative. Many creation myths have water as the creative element; life and the world emerge out of the creative waters. According to some interpretations, such myths are related to human genesis from the waters of the womb. More generally, many creation myths depend upon parallels between human and cosmic birth.

Commonly, in many traditions, the deity who creates the world is presented as a lesser deity or a

lesser aspect of the Supreme and transcendent deity, in which case he is usually called the “demiurge,” a divine craftsman who crafts the world from raw materials according to a celestial model. In dualistic systems, this demiurge is often portrayed as evil since he brings into being the world of suffering and decay. In more positive accounts, he is said to be perfectly generous and the creation is a result of his overflowing generosity and beautiful handiwork.

In psychological terms, the point of creation represents the moment of ultimate potential and unlimited creativity. There are some modes of therapy – such as Arthur Janov’s “primal therapy” – that propose a psychological return to the moment of birth or even conception. In the arts, artists will often seek an experience in which they feel connected to the moment of cosmic creation. A famous instance of this can be found in Samuel Taylor Coleridge’s celebrated visionary poem *Kubla Khan* where the poet – under the influence of opium – is transported to a “fountain of creation” that is the source of creativity.

Creation and Creativity

Joanna Gardner

San Luis Obispo, CA, USA

Creation Myth and the Creative Process

Creation myth contains narrative accounts of how one or more deities created the world. Because they are divine beings, creator goddesses and gods represent sacred, iconic images of creativity and the creative process. These myths might seem to have little to do with human creativity, because humans create on much smaller scales and because humans do not possess the magical powers of manifestation that goddesses and gods demonstrate. Interpreted metaphorically, however, cosmogonic tales of origin present imagery of archetypal creativity that can elucidate the day-to-day creative process as understood by research psychologists. Creation myths imagine creativity mythopoetically, conveying the subject through images and correspondences. Cosmogonic narrative presents imaginal case studies of the psychology of divine creativity.

Research psychologists define creativity as the ability to produce new and useful products. On the archetypal scale, creative products include the cosmos, the world, and the great powers therein such as earth, sea, sky, and wind. On the human scale, creative products include tools, scientific breakthroughs, art, and creation myths themselves. All creation myths were new at some point and have proven themselves spiritually and psychologically useful through their explanatory power, their ability to connect individuals with the greater cosmos through the imagination, and perhaps their ability to inspire further creativity. The creative people who make creation myth might even consciously or unconsciously include aspects of their own creativity in stories of divine origin. Creation myths represent examples of creative products and images of the creative process, as imagined by many different tellers from different cultures in different times.

Creativity researchers study creativity from a wide range of approaches. Some study the contributions of different styles of thought, such as wide-ranging divergent thinking versus the more focused style of convergent thinking. Some study the personality traits of creative people, such as the influences of motivation and different affective states on the production of creative work. Some study the creative process, which can include stages such as knowledge gathering, incubation, impasse, illumination, and verification. Some bring cross-cultural viewpoints to bear on the study of creativity. These and other areas of creativity research appear metaphorically in creation myths.

For example, androgynous creators such as the goddess Neith in ancient Egyptian myth display stereotypically masculine and feminine attributes, thereby demonstrating the personality complexity of creative people (Csikszentmihalyi 1997). The Hindu god Brahmā meditates before creating, in consonance with research findings that meditation increases creativity (Chaudhary and Pillai 2016). The collaborative creator gods in the Mayan Quiché creation epic *Popol Vuh* offer an image of the group creativity that can surpass the creativity of individuals (Sawyer 2012). The West African Yorùbá god Olódùmarè creates by means of an archetypal chain that connects heaven and earth, a polyvalent image of strength, coldness, captivity, reliability, divinity, and earthiness that well represents the ability to embrace ambiguity, which is a personality trait vital for creativity (Dacey and Lennon 1998). And the God of Genesis in the Hebrew Bible emphasizes the initial appearance of light, in an apt image of the illumination stage of the creative process, where new and useful ideas break through a state of impasse and fill the creative person with a feeling of metaphorical light (Russ 1993).

The diversity of creation myths reflects the diversity of approaches to and expressions of creativity. Each myth and each deity represent unique imagery of and perspectives on creativity, and no single myth or deity captures the entirety of the subject. Creativity researchers and creative people share a similar range of approaches and

expressions. In myth and in research, creativity resists generalizations.

Three commonalities of most creation myths are instructive, however. First, creation myths afford creativity a sacred dimension through their divine creative agents. Human creativity can participate in this same sacredness. Second, creator goddesses and gods set the example of showing up to their creative work unburdened by the human habits of procrastinating, complaining, or worrying. Third, creation myths convey their insights by means of the imagination, a style of thought which is essential to creativity (Csikszentmihalyi 1997). Individuals must imagine creator goddesses and gods in order to observe their attributes and actions, in effect exercising their faculties of imagination. These imaginal calisthenics also teach on a deeper, more psychological level than nameless, faceless statistics and research results. Imagining creator deities and their creative processes allows the individual to connect with them in the way of encounter, affection, empathy, and relationship.

Creator gods can be mentors, guides, and exemplars. They can lead by inspiration. No single deity's image applies perfectly to any individual's creative work, however, and many creator deities display maladaptive and even dangerous traits. Therefore, creative individuals would do well to emulate creator gods with great care and consciousness.

Creation myth offers a mythopoetics of creativity, imagining creative beings with whom the listener or reader can relate and adding meaning, beauty, and depth to the data of creativity research. Together, research and creation myth reveal a more fully developed, multidimensional view of the complex subject of creativity.

Creation Spirituality

Steven B. Herrmann
Oakland, CA, USA

I begin my essay with an overview of Matthew Fox's autobiography *Confessions: The Making of a Post-Denominational Priest* to provide the reader with a sense of where Creation Spirituality had its roots: in Matthew's childhood experiences, experiences in Nature, readings, Dominican studies, relationships with Native Americans, dreams, vision quest, and his encounter with the California poet, William Everson. As the reader will see, *Confessions* is not only a personal memoir but a cultural memoir, a memoir of the world's coming to consciousness in an age of Transformation. First, let us begin with a brief definition. By "Creation Spirituality" Fox means a *fourfold path*:

1. *Via Positiva*, delight, awe, wonder, and revelry
2. *Via Negativa*, darkness, silence, suffering, and letting go
3. *Via Creativa*, birthing and creativity
4. *Via Transformativa*, compassion, justice, healing, and celebration

(Fox 1996, p. 283).

All four of these paths suggest ways to human wholeness. Fox brings an early awareness into *Confessions* to the body. He links awareness of the body to cosmic history, in the supernova explosion that astrophysicists say occurred billions of years hence: an explosion of a star “that birthed the elements in our and other creatures’ bodies” during the big bang of Creation. This birthing became the starting point for his book *The Coming of the Cosmic Christ*. Yet, it was in Madison, Wisconsin, that Fox first sensed an “awareness of the Native American presence” and growing up in the Green State, he says he “often felt a spirit presence in the outdoors” (Fox 1996, p. 21).

This is a significant statement, for something of the Native American presence in the land spoke to Fox and continues to do so today, as it does so many Americans. Fox directs us all to look for our spiritual roots in an earth-based wisdom. It is this rootlike aspect of the archetype of Spirit and its ability to *embed* itself in the earth, Nature, and the world that to my mind can help make comprehensible Fox’s discovery of his own personal mythic vocation of cosmic spirituality.

This earth or cosmic Spirit he refers to is, I believe, shamanistic in its Native Ground. If I am right in my hypothesis, Fox’s narration of his subjective myth may be read as a story of our culture’s attempts to recover its religious roots in the indigenous traditions of primal peoples of the earth and in facts of modern science. Indeed, Fox sunk the roots of the creation-centered spirituality tradition (of Europe) into the very depths of the American earth, and it is in this sinking, of an intellectual notion into the earth, into what Meister Eckhart calls the “Godhead” that Fox achieved his vision of Creation Spirituality for the current era.

The roots of his quest may be found in Fox’s coming of age in the Dominican House of Studies in River Forest, Illinois, just outside Chicago (Fox 1996, p. 23). In an ironic twist of fate, Fox tells us he boarded the “Empire Builder” that took him on a ride to the Far West, to a hermit colony on Vancouver Island (Fox 1996, p. 29), and it was

there that Fox’s journey, from outer preoccupations with his Christian base, was traced to the source of all Cosmic Light: what ancient Hindus called the Self.

One cannot read *Confessions* without sensing connections between Fox’s vocation as a Dominican and his call as a post-denominational priest to bring Light to the world out of creation spirituality traditions, in a way that transcends the divide between Eastern and Western spiritualities. The journey to the hermitage and his contemplations of the Nature and Cosmic being are a quest to find his religious vision in Western-Eastern spiritualities. He found a bridge in the writings of the most transcendental Dominican preacher of Europe, Meister Eckhart, who Fox judges as “the West’s greatest mystic” (Fox 1996, p. 39).

It was not in America, however, that Fox came upon Eckhart’s works – but, rather, through his summons in the East and his calling to Paris, France, which came by way of a personal letter from Thomas Merton (Fox 1996, p. 41). It was in Paris, at the age of 26, that Fox met his mentor, Père Chenu, who lit his mind on fire and helped him understand the origins of Creation Spirituality, a term Father Chenu coined. Yet Fox’s tracing of his vocation to the spirits of Nature sound shamanistic to me, and it is clear that William Everson played a pivotal part in his process of self-discovery.

Since the Christ myth is only 2,000 or 3,000 years old, we must look deeper, I believe, to the shamanic traditions of the globe, for the precursors of Christ. Perhaps it was the shamans in whom the first cosmic visions of the Self were first incarnated that carved the deepest channels to the Cosmic Selfhood in the World Soul (Herrmann 2010)? Whatever the indigenous forces are that have shaped creation-centered spirituality in America, Matthew Fox has been aware of them, often to a marked degree.

Yet Fox, a theologian, not a shaman or medicine man, recognizes that healing is a natural part of the *Via Transformativa* and that it is really a priestly function to contribute, through compassion and social justice, to the healing of the

collectivity. And his “dream” of Creation Spirituality and the conscious extension of it offer a *cure* for what is ailing the West. It is my hypothesis that Fox was called by the “shamanic archetype” (Herrmann 2009, 2010) to administer medicine – the *Via Transformativa* – to his Dominican colleagues, an Institution of inspired and uninspired thinkers that had become disturbed in its collective functioning, since it had denounced the teachings of its greatest Christian mystics. Fox’s cultural call, vocation, was to bring the sacred mystical teachings back into the vestibule of the Church and to show, through his rereading of Eckhart, Aquinas, Hildegard, and other Christian mystics, how all religions are essentially related, how they all connect, at their roots, and where the future direction of religion might be tending. Fox has tirelessly demonstrated how all churches must eventually become ecumenical if they are to survive and how creation-centered spirituality is really our myth, a myth in which we, as a species, are currently living out our Fate or Destiny. Its roots, I believe, can be found in shamanism.

Fox’s time spent at the *Institut Catholique de Paris* was a time of cultural turmoil and revolution, and during this occasion of transformation, Fox was to play an instrumental role in attempting to alter the very structures upon which Christianity had been built. But Fox had no doubts that his work was in America. Although he happened upon the term Creation Spirituality in France, under Chenu’s tutelage, his calling was to discover the source of it, and this involved a re-rooting of his mind in the indigenous ground of North America, where his original experience of the numinous was, on our own continent: in lakes, trees, and woods, first awakened during his childhood and adolescent sojourns. Fox tells us he was actually visited by Meister Eckhart himself in a dream. He views this dream as the “most transcendent dream” of his life (Fox 1996, p. 105). What came out of the dream and his shamanic suffering of his Christian heritage is the creative birthing of the Institute for Creation Centered Spirituality (ICCS), in Chicago.

Fox informs us that at Meister Eckhart’s famous trial for heresy, the Rhineland preacher told the people present that we are all meant to

“soar like eagles” (Fox 1980, p. 123). In Eckhart’s mystical tradition, Fox found his foothold, his fourfold path, as well as a beginning of his troubles with Rome (Fox 1996, p. 127). The source of this controversy really began to heat up with a talk he gave to “Dignity,” an organization of gay and lesbian lay Catholics in Seattle. This spirited talk planted the seeds for something ominous in the outworking of his career that he could not foresee, and it marks the major moment of inception of a vision that was to become central to the four paths of Creation Spirituality.

Little did Fox know, in giving this talk, what the reverberations would be in Rome and how these rumblings would send shock waves to Chicago, to California, and would eventually be felt in his life and in the lives of his faculty and students at ICCS. Like many of the big decisions that have come to him, the move of ICCS from Chicago to Holy Names College, in Oakland, California, was presaged by a dream that involved his quest for an indigenous “aboriginal mother love” that reveals his unconscious draw towards native regions (Fox 1996, p. 131). His dream depicts a descent to ancient pre-patriarchal religious sites. What Fox was seeking, at this time, is a personal and cultural healing of the lost connection between Western religion and science, a reconnection to the Goddess, and shamanism. During his journey West, he was seeking not only a cure for his personal wounds but also a cultural medicine (the *Via Transformativa*) for Western and Eastern religion as a whole.

During his mentorship under Chenu in Paris, Fox learned that our religions were not only troubled – they are sick; and in California, he found some of the medicine he was seeking to doctor at least some of the ills of Western civilization. Creation-centered spirituality aims to put us in accord with Nature and, as such, with the wisdom of the mother religions, the animals of the soul, and the lifeways of shamanic cultures. Fox tells us that the cure for the ailment of Western religion can be found in a “*spiritual encounter*,” what William Everson referred to as “the essential genius of American spirituality” (Fox 1996, p. 133) as it was embodied and ennobled in the valiant fights of John Muir over the damming of

the Hetch Hetchy. Everson saw Muir's struggle to defend the American earth, its lakes, trees, and rivers, as "perhaps the chief turning point in the spiritual life of the nation." Reading Everson's seminal book, *Archetype West*, helped Fox understand his Christian vocation, as an American, like never before. "Nature is divine, the American soul was saying" (Fox 1996, p. 134), and the shamans of all nations had seen this to be true, thousands of years before Christianity.

Following the tracks of the shamanic archetype, at ICCS, Fox became deeply inspired by the Lakota spiritual teacher, Buck Ghost Horse, who was on the faculty there and bestowed upon him a sacred pipe (Fox 1996, p. 139). Following Cardinal Ratzinger's letters of complaint to the Magesterium over his book *Original Blessing*, Fox was then forced to take a year of silence, and during this dark time, he let go and followed the natural flow of the path of the *Via Negativa*. This does not mean that he was inactive. For during this year of silence, he published *The Coming of the Cosmic Christ*.

It was then that another chance occurrence filled him with an inner light of meaning. Fox was given a "medicine feather" of a vulture from New Mexico from a Lutheran pastor in a mid-western city, whose spiritual directors had been Native American shamans. Fox saw in the synchronicity of this event that his work had been to take what was dead in Christianity and recycle it, like a vulture (Fox 1996, p. 177). What gave Fox the fortitude to endure his trial of strength over his silencing was something inherent in the American earth itself, a fighting spirit ennobled in our American Bill of Rights: the Freedom of Religion.

Fox knew that the basic Christ principle is compassion and holding his Light to be a self-evident truth in the Bible, and with its knowledge, he set forth, courageously, to chart out his own vision, outside the Catholic Church, towards a path to a greater completeness. As a creative response to the year of silencing, Fox was led by the Native American spiritual elder, Buck Ghost Horse, on a vision quest, where his vocation to combine Native American spirituality with Western mystical traditions reached an apotheosis point in his inner evolution. It was during a

visionary experience, atop a lonely mountaintop, during his questing, that the shamanic archetype penetrated his psyche with the brute force of a revelation, and his vision of creation was enlarged by an embrace with the indigenous peoples of North, Central, and South America, Aztec, and Inca (Fox 1996, p. 189). During his vision quest, Fox was given by Ghost Horse an "eagle-defense prayer stick" to protect him from the negative inquisitional forces of the Vatican (Fox 1996, p. 192).

Following his illuminating and dark ordeal of the vision quest (most of the entire forest was illuminated), Fox was eventually led to Nicaragua, where he visited Ernesto Cardenal, a former student of Thomas Merton and an avid reader of Walt Whitman. Like the Chilean poet, Pablo Neruda, and Jorge Borges of Argentina, Cardenal was deeply inspired by Whitman's long-line technique of free verse in the writing of his 600 page *El Cántico Cósmico*. As he was working on his book *The Reinvention of Work* on March 3, 1993, where the subject of vocation was elevated to a universal principle, across all religious traditions, Fox received the infamous letter of expulsion from the Vatican, which is as much a tragedy for the Catholic Order of Dominicans as for Fox himself: they lost their most ecumenical theologian! Yet, the Dominicans were also amongst his best of friends. In a letter of appreciation for his book on Aquinas, sent from William Everson, Fox was consoled and celebrated for his many achievements, in the following compassionate words: "May God sustain you in this moment of triumph of your vocation" (Fox 1996, p. 216).

Part of Fox's vocation, following his ordination as an Episcopal priest, has been to restore into Creation Spirituality the erotic mysticism that the Church has been lacking, including a warm embrace of feminism and homosexuality. For surely, a central part of the evolution of Western spirituality, Fox asserts, has been not only to make it more ecumenical but also to make final "peace" with our sexuality (Fox 1996, p. 237). Fox is far ahead of his times in this regard – for the good news is that the revelations of the Holy Spirit did not end with Scripture or with the Doctrines of the Church; and what better place to extend the myth

of Christ, and Christianity, than on the American continent, where the body was not divorced from Divinity (Herrmann 2010)!

What is needed, for our times, Fox feels, is the restoration of Christ's animal body and his sexuality for the future reinvention of priestly work in America, and Fox has been at the center of a revolution in the West to begin this effort of reinventing the priesthood by flinging the doors of Christianity wide open to all people, believers and nonbelievers alike. As a post-denominational priest, Fox has come to realize that his vocation outside the gilded gates of the Vatican has been to make Creation Spirituality known to the world (Fox 1996, p. 245).

During the writing of his memoirs, at 53, Fox said about Catholicism and Protestantism: "we must both draw from these two traditions *and move beyond them*" (Fox 1996, p. 256). The movement beyond Christian denominations and creeds is a transport of our culture *beyond* traditional images of Christ to a spirituality that is more earth-based and therefore extra *embodied*. Fox's fight to liberate sexuality, feminism, and deep ecology is what threatens the Church from its overly anthropomorphic views of the Bible (Fox 1996, p. 261).

When I read of the panentheism inherent in Eckhart's writings in Fox's book *Breakthrough*, I get a sense of the presence of Emerson, Thoreau, Melville, Whitman, Dickinson, Jeffers, or Muir, in the kind of mysticism Fox helps give birth to. What Fox has been seeking is a new priesthood, which can make room for *panentheism*: "New and ancient ways to midwife transcendence" (Fox 1996, p. 266). Coming full circle, from the cradle in Wisconsin, to France, to his spiritual return to his Native soil as an American, in California, following his encounter with Everson, Fox has come to see his role in society in the sacred lineage of religious teachers: "A time like ours – a transition time – is a time for old images of God to be buried and new ones to emerge" (Fox 1996, p. 272). The new images of God that will help to shape the future are just beginning to emerge on the horizon, during the world's crisis in faith in all three of monotheisms: Judaism, Christianity, and Islam.

From 1996 to the present, Fox has continued to expand his thinking about this. From my personal conversations with the priest, it is apparent that he has been at the forefront of American spiritualists in moving towards a new spiritual paradigm that could help bring further evolution to the God-image to include a wider embrace and to bring forth and reclaim the emergence of the healing powers of shamanism for the global community. He challenges symbolically the patriarchal monotheistic judgments towards the feminine and nature in all three monotheisms, and his aim is to help liberate us from the shackles of patriarchy.

If a new birth of Spirit is to come to age, the world will need to let go of the fundamentalism and literalism of the Hebraic God, Christ, and Allah that are threatening the global village with more un-Holy Wars. New images of God that are emergent from the depths of the earth during this tragic moment of the death of the three patriarchal gods – their institutional track record of absolutism, racism, sexism, homophobia, and inquisitionism – will have to make room for an emergent Spiritual Democracy (Herrmann 2010). This means that we will have to face the facts that there is plenty of sea room in the collective psyche for new images of the Spirit to emerge on a cross-cultural, transnational basis for each to find his or her place on a shimmering globe, spinning in endless Space. Such a vision of the transcendent unity of the human mind with the Ground of all Nature requires a descent into the earth, a movement "down" into the vast rivulets of the river of life.

This is a subject Fox takes up in *One River, Many Wells*, in what he calls "deep ecumenism," a notion structured by Meister Eckhart's metaphor of an Underground River, consisting in Fox's mind, of many wells of the world's religions all seeking their spiritual nourishment from its One matriarchal Source. Fox does not call the Underground River the Cosmic Christ. He leaves Eckhart's metaphor intact for what it is: River within the earth. In fact, he often uses terms such as "Buddha Nature" for the "Cosmic Christ," and of course he also talks about "the goddess," the Divine Mother, the Sacred Feminine, the Black Madonna, etc., in his many books and essays, and

especially in his newer book *The Hidden Spirituality of Men*. It is true that in the Cosmic Christ book, he uses the name ("Cosmic Christ") a lot, but that book is now 22 years old, and in it he proposes "Cosmic Wisdom" as an alternative title for those who carry too much baggage around the Christ movement. He also cites Thomas Aquinas on many occasions, who says "every creature is a name for God and no creature is a name for God" and Eckhart: "God is superessential darkness who has no name and will never be given a name." In this same tradition of the Apophatic Divinity, he also talks of the "Godhead," which is very different from God (as Being is from Action among other things). In Chapter 8 on the void and nothingness in *One River, Many Wells* and Chapter 5, on the multiple names for God, Aquinas and Eckhart and Fox suggest we simply can't understand the Divine with the mind. So, while some may feel that the Christ-image is not broad enough to include the spiritualities of the earth, Fox feels that the cosmic dimensions of Nature is large enough to contain us all, if we are open to further expansion of the Holy Spirit or the Buddha Mind in our lives.

It is perhaps his message of the cosmic Christ's and the Sacred Feminine coming into one's personal lives that might offer the brightest hope in the future direction of Christian religion, whether inside or outside the Church. For All religions have something important to teach us, Fox argues, and they are all still very *alive* today in the daily spiritual practices of billions of humans.

In Fox's California experience and his fortuitous encounter, through William Everson, with the writings of John Muir, an indelible mark was left on his spiritual inheritance that gave him a deeper appreciation of what the meaning of the Cosmic-Self archetype might be for the postmodern era. The reuniting of Christianity with Native American shamanism and the science of the Cosmos is at the center of Fox's efforts to instill creation-centered spirituality into the hearts and minds of people who are searching for answers to questions regarding their crises in faith. His basic belief is that there are many wells (religions) to God, but only One River. Whether to call this River the Godhead or the Buddha Mind, or the

Black Madonna, or the scientific term Cosmos is the central question I am left with from a post-Jungian angle. The Underground River and Cosmos are, of course, two distinct archetypes of one marvelous unitary phenomenon within the vast diversity of Nature, and what is most remarkable about Mathew's celebration of Creation Spirituality is that he fuses the "upper" Cosmic Consciousness with the "lower" chthonic, instinctual dimensions of psyche, mind, and Earth.

As a follower of Eckhart and his metaphor of the One River, Fox may lift our spirits and deepen us down towards a more feminine earth-based wisdom still: Gaia as our Mother-wisdom. By moving us to listen to the ancient wisdom and voices of the Goddess and Native peoples of the earth (shamans and medicine people), we will hopefully open our ears to God's cosmic music of the spheres and learn how to dance together a human tribe, before it is too late.

Fox's vision of Creation Spirituality instills hope in the future direction of the Christian religion because it is ecumenical at its roots. Only through the transformation of religion, as we have come to know it, will a new birth in spirituality come about. Fox appears to be at the forefront of spiritual change. The changes in our soul concepts have the potential to inaugurate a shift in focus towards deep ecology that may reverse the axis of the world, hopefully turning our overly patriarchal religious institutions upside down. In *The Hidden Spirituality of Men* Fox writes: "Archetypes, like stories, make demands on us" (Fox 2008, pp. xxi, xxiv) and then adds this emphasis: "A rebirth of culture and self comes from one's soul and not from institutions" (Fox 2008, p. xxiv). Fox is getting at the heart of a current debate in our world regarding religious relativism. For Myths are, indeed, where changes in our soul concepts can be seen in their budding forms; Myths awaken us.

As I have indicated, Fox is at the cutting edge of spiritual transformation in American writing. His work is controversial, very much so. It challenges us! We may not agree with all of his ideas, but his books are essential reading, for anyone who wants to be informed about his myth of Creation Spirituality and what it has to offer to a

world on the verge of spiritual Transformation. Towards this effort, Matthew has played an important part in the cosmic drama of evolution.

Criminality

Jessica Van Denend
Union Theological Seminary, New York,
NY, USA

Criminality is the state of “being” a criminal, a designation generally accompanied by social stigma. A criminal is someone who commits a crime or, in other words, breaks or fails to comply with a law or rule. Implicitly then is the presence of a governing authority dictating law and enacting punishment for failure to adhere to it. The word crime originates from the Latin root *cernō* and Greek *κρίνω* = “I judge.”

How social criminality relates to breaches of divine law or covenant – sin in Judaism, Christianity, Islam, or *pāpa* in Buddhism and

Hinduism – has been complicated and contentious through the centuries. Roman Catholic canon, Puritan moral law, Islamic sharia, and Jewish halakah are examples of religious legal systems which claim absolute and all-encompassing jurisdiction over their adherents and yet must still navigate with political power structures and power-sharing with people from other or no faith. One has only to look as far as contemporary politics in the United States to see the line of demarcation between civil and moral laws, debatably able to be held as an abstraction, grow complicated, and even become erased in practical application as pathology, moral wrongdoing, and criminal activity become blurred: legal prohibitions against alcohol consumption, miscegenation, and homosexuality, being some historical and not-so-historical examples. Depth psychology complicates the matter even further, undermining the simplicity of legal and moral judgments by raising the possibility of motivations and impulses for criminal activity that lie outside the conscious self. What is one's culpability or moral responsibility for actions that result from forces outside one's conscious control, outside one's, in religious terms, free will? Despite his wisdom and incredible intellect, it was not his own decision making but a bigger fate – announced through a prophecy given by the Oracle at Delphi – that eventually dictated Oedipus's path and led to his tragic crimes.

A lot of energy has been put forth in psychological studies towards a new definition of criminality that incorporates the unconscious; the criminal and his/her unconscious has become a fascinating object of study. All of these accounts must take their place within the nexus of biological, psychological, and sociological factors. Cesare Lombroso, a fin de siècle criminologist, thought criminality could be detected as biological degeneracy, which would appear in particular physiognomic features. Others were more inclined to see criminality as housed within psychic reality. It was this view that made Wilhelm Stekel optimistic that criminality could be cured or even eradicated through psychoanalysis, stating, “Perhaps this change of the social order will go so far that in times to come criminals will be

analyzed instead of being punished; thus the ideal of a world without a prison does not appear as impossible to us as it did to a former generation" (1933).

Freud gave the famous and still clinically utilized depiction of the "pale criminal," who commits crime out of an unconscious sense of guilt that expresses itself as a "need for punishment" (1916, see also Reik (1925) and Fenichel (1928)). Anna Freud discusses criminality that results from defused aggression (1972), while others (Alexander and Staub 1956; Bromberg 1948; Steckel and London 1933) will talk about criminality as the opposite end on the scale as a neurosis - a too-lenient superego that cannot control criminal tendencies from the id. Melanie Klein will directly contradict this: rather than weak or nonexistent, she says, the criminal's superego is overly strict, which causes the criminal to feel persecuted and seek to destroy others (1988/1934). Another tendency is to place criminality in an earlier, infantile stage of psychic development, whether in preoedipal rather than oedipal processing of guilt (Klein 1988/1927), a pre-genital narcissism that is guided by wants and entitlement (Murray 1967) or a fixation in the anal-sadistic stage (Chasseguet-Smirgel 1978; Simmel 1920). Others, including Simmel, Westwick, and White, add an increased emphasis on the impact of physical and social environments, making room for an understanding of criminality as social protest. D. W. Winnicott links the criminal back to the deprived child, who once had and then lost something good enough from the environment (1984, 1987). Object-relations school will look at criminality in terms of the nexus of family and social relationships (Buckley 1985; L'Abate and Baggett 1997). Criminal acts have been speculated to both as transitional phenomena that attempt to create communication and dependency (Domash and Balter 1979) and as an impasse-creating defense against emotional contact and relationship (Ferro). According to Lacan (1966), the criminal is one who mistakes the symbolic for the real. Lastly, new understandings of shame (Gilligan 2003) and of trauma have also fed into criminological studies, and a more complex

understanding of how victims become victimizers; Sue Grand discusses the "catastrophic loneliness" caused by "malignant trauma" that perpetuates evil (2000). A tangential piece of these studies has been the evolving studies on the criminality of women - back in interest these days in the USA due to rapidly increasing rates of female incarceration.

Analysis

These studies, while useful towards increasing understanding and implementation of the knowledge of the unconscious, are at their weakest when they profess a definitive characterization of the criminal; taken in their entirety, it seems obvious that the question of what we do with the bad in ourselves and how we contain or act on urges to hurt others are as unique and individual as (and connected to) Freud's Oedipal gateway or Jung's process of individuation. What is not unique, depth psychology and religion suggest, is that they are present. The earliest founding story of the Abrahamic traditions, which of the fall from the Garden of Eden, although interpreted differently by different traditions, is based in the concept of a primal crime, inherited by all people. (Freud too, in *Totem and Taboo*, narrates a creation myth in this vein.) According to most interpretations of these stories, who we are as people is born out of a criminal act, and in effect, in religious terms, our "fallenness," as well as the potential for further criminality, lies in every one of us. In the words of Ferenczi: "I must look for the cause of my own repressed criminality. To some extent I admire the man who dares to do the things I deny to myself" (qtd. by Costello 2002). Or Dostoevsky: "Nobody in the world can be the judge of the criminal before he has realized that he himself is as much a criminal as the one who confronts him" (1957). Or Jesus: "And why do you look at the speck in your brother's eye, but do not perceive the plank in your own eye?" (Luke 6:41-42, NRSV).

Seeing the criminal as an object of study, then, has the potential to reify him/her as a subjective other, separate and quantitatively different from

the investigator. It is important to ask what function morality is serving, who is doing the judging, and when do those human authorities benefit from remaining unquestioned or invisible or equated with the divine. Also, there is further thought to be done on the process of transformation from crime (action) to criminal (person) – when actions designated as “good” or “bad” designate people as inherently “good” or “bad.” DeGrazia writes that society has a stake in maintaining the clear split between “good” and “bad,” arguing that we need the preservation of order and of our ability to make decisions based on knowing who is bad and who is good (1952). Perhaps, yet we cannot pretend that we live in a world without principalities and powers. William A. White writes that “the criminal becomes the scapegoat upon which [man] can transfer his own tendency to sinfulness and thus by punishing the criminal be deludes himself into feeling a religious righteous indignation” (1966, see also Menninger on the desire for vengeance). Neil Altman lists criminality, along with exploitation, greed, unrestrained sexual passion as displaced by white people on to persons of color.

Lastly, studies focusing solely on the individual criminal can have the unhelpful consequence of obscuring the equally if not more relevant criminality of groups, societies, and nations. Jerome Miller criticizes psychologists and other social scientists for their complacency towards an emphasis on individual pathology, being willing to provide “the labels necessary to proceed with the most punitive recommendations available” (2001). Even some laws may in fact be criminal, as advocates against segregation, apartheid, systems of colonialism would historically attest, and as opponents of, for example, the Rockefeller Drug Laws in New York State would argue today.

Religion must answer to Freud’s criticism of it as an agent of moral repression; it must decide how much of its function is indeed in reinforcing prohibitions or how much it also has a stake in providing a new space with which to evaluate the power structures, a separate authority that may trump improper usage of power and inequitable power structures. Historically, it has been the mechanism by which good and bad are kept far

apart, and inequities are maintained, as well as the voice of conscience that, for example, led a few pastors to resist Nazi power, even by becoming criminals. Perhaps there is something to be said for breaking the rules. Jung took issue with religion aligning itself too much with the “good.” Freud (1910) criticizes him for suffering from the “vice of virtue.” He writes, “One must become a bad character, disregard the rules, sacrifice oneself, betray, behave like an artist who buys paints with his wife’s household money or burns the furniture to heat the studio for his model. Without such a bit of criminality there is no real achievement.”

Crises in Religious Movements (Failed Prophecy, Succession)

Benjamin Beit-Hallahmi

Department of Psychology, University of Haifa, Haifa, Israel

New religious movements (NRMs) are, by definition, belief minorities often in confrontation with the majority. While marginal in terms of popularity, and involving no more than 1% of the population anywhere, they attract attention from media and scholars, and often produce dramatic events.

Three kinds of crises in new religious movements (NRMs) have been explored by researchers: failure of prophecy, leadership succession, and leader-initiated catastrophe. The type of crisis that has been investigated most often is the failure of prophecy, especially the phenomenon of stability in faith following the disconfirmation of major assertions and prophecies. Research has focused on groups which experienced a direct disproof of predictions made by leaders. Such was the case of the group described by Festinger, Riecken, and Schachter, in *When Prophecy Fails* (1956). On a specified date, which the group announced to the world, all of humanity would perish, except for group members, who would be taken away in a spaceship. The date was announced (December 21, 1953), and group members expected the end of the world, and

their own salvation. After the prophecy failed, some of the group members maintained their faith. The group did not survive this crisis, but its disintegration was not immediate.

A popular notion, derived from Festinger et al. (1956), is that disconfirmation leads to increased proselytizing, as a way of reducing members' cognitive dissonance. This proselytizing hypothesis has not been confirmed in other studies. Still, the typical case remains that of a group which manages to cope well with what outsiders consider a major disconfirmation of faith.

There are cases where prophecy failures have not led to any visible crisis, possibly because the prophecies were only subject to disconfirmation in terms of timing. Thus, a prediction about the coming end of the world in 1984 may be reinterpreted as true in principle, and only temporarily delayed by other events. Under these conditions, a challenge to the group is met by an affirmation of ideological loyalty.

It has been suggested that researchers have underestimated the power of faith and commitment. One way of recovering from a loss is the refusal to fully register events. In most cases, groups have survived disconfirmation through some effort, but in other cases, a direct disconfirmation of claims leads to decline or disintegration.

To an outsider, it appears that prophetic or messianic failure will create a need to cope with shame and disgrace, and will be accompanied by loss of confidence and depression, but in many situations, individuals and groups are naturally capable of tolerating ambiguity and contradictions. Consistency is something that humans try to achieve only when reflective thinking is involved and some outside demand is felt. In some cases, the failure of several predictions about apocalyptic events was simply ignored by members. It was probably considered less important than other aspects of group membership.

Apparently, what counts is the framing of an event. A prophecy by a leader may be perceived from the outside as central and experienced from the inside as marginal. Some

believers may frame an event as irrelevant to their commitment, which remains stable despite outsiders' judgment. Members will decide whether a disappointment is great or small. Identical processes may be observed in political groups, where loyalty is tested by repeated defeats.

A crisis that is more common than a failure of prophecy involves the loss of a leader, who in an NRM is often the founder. The International Society of Krishna Consciousness (ISKCON), popularly known as "Hare Krishna," was founded in 1966 by Swami Prabhupada in New York City and became one of the best known NRMs of the period. Before his death in 1977, the founder decided to create a collective leadership and appointed eleven gurus from among the membership.

This has not stopped the group from going into what might be called a "postcharismatic decline." After 1977, the movement has suffered a series of serious leadership crises, schisms, and disputes. Eight of the eleven trusted disciples were expelled from ISKCON. There have been many confirmed reports of drug abuse, physical and sexual abuse, and of criminal behavior, including murder, involving members and leaders, which led to serious attempts at reform and revitalization. In 1998, ISKCON issued an official report detailing abuses in its boarding schools and paid about \$10 million to victims.

A crisis of succession and leadership which involved also one of the most shocking cases of sexual exploitation by a leader, took place in 1988–1993. Vajradhatu, a Western Tibetan Buddhist group, which has changed its name to Shambhala International, was founded in 1971 by Chogyam Trungpa, Rinpoche (1939–1986). Contrary to the widely held image of the Buddhist monk, Trungpa was visibly non-celibate, having sex with women followers, drank alcohol quite heavily, enjoyed meat and smoked tobacco, but objected to the use of marijuana.

In 1976 Trungpa named a successor, Thomas Rich, who took the name Osel Tendzin. Tendzin became the leader, upon Trungpa's death in 1987. Appointing a non-Tibetan as the successor to

Trungpa set a highly unusual precedent, but the Vajra Regent, as he was known, was a man of charisma and ability. The movement seemed to be overcoming the succession crisis, but then came a predicament that no one had expected. It grew out of the leader's sexual practices. He was openly bisexual and had numerous sexual partners. This turned out to be a problem when the leader contracted AIDS and still continued to have sex with followers. The movement tried to hide the problem for a while.

In March 1989, Osel Tendzin was accused of having sexual relations with disciples and of knowingly transmitting the AIDS virus. At that point, he explained his behavior in public meetings and stated that it was his teacher, the movement's founder Trungpa, who had assured him that he had nothing to worry about regarding himself or his sex partners, thanks to "Vajrayana purification practices" and his enlightened state of being, which protected him from any effects of the HIV virus. He was eventually asked to resign from his position, and died in 1990.

It should be noted that despite the crisis and disillusionment with the leadership, most members remained completely loyal, and the movement survived, but its name was changed to Shambala. A visit to the Shambala International web page leads to the positive description of Osel Tendzin, described as "an inspiring teacher" and an "effective administrator."

After 1993, the group's leader has been Sakyong Jamgon Mipham (born Osel Rangdrol Mukpo on December 11, 1962), son of Chogyam Trungpa. In July 2018, it was revealed that Sakyong Jamgon Mipham Rinpoche was involved in sexual harassment and sexual relations with female followers. He also confessed to being an alcoholic. His leadership activities have been suspended, and the group is now again facing the same predicament that appeared in 1988. We can safely predict that whatever decision is made in terms of leadership, most members will maintain their loyalty, and the group, with its thousands of followers, will survive.

The third type of crisis faced by some NRMs has been a catastrophic mass murder

choreographed by leaders. It leads to the death of most members, but not the end of the group.

Since the late 1970s, there have been several well-publicized NRM mass killings tragedies, including the Peoples Temple, the Branch Davidians, the Solar Temple, Heaven's Gate, the Movement for the Restoration of the Ten Commandments of God in Uganda, with 924 members killed in March 2000. The victims often included dependents of group members, and not just members. These groups turned out to be totalitarian organizations where exploitation and violence were inherent.

One well-publicized case was that of The Order of the Solar Temple (*Ordre du Temple Solaire*), which was an international Rosicrucian-Christian group. It was started in the 1980s by Luc Jouret (1948–1994), a Belgian practitioner of homeopathy, and Joseph Di Mambro (1924–1994), a Canadian. The group was active in France and in French-speaking areas of Canada, Switzerland, and Belgium. Joseph Di Mambro and Luc Jouret had between them a wide repertoire of fraudulent practices, from bad checks to fake cures. The official belief system of the group, combining claims about "ancient Egypt," "energy fields," reincarnation, and the "Age of Aquarius," is so widely offered in hundreds of groups all over the world as to be banal and harmless. But this was a high-involvement group, not just a club built around a series of lectures.

This meant that members signed over their assets to the group, which according to some estimates had more than ninety million dollars. Luc Jouret preached a coming apocalypse, for which members had to prepare by arming themselves. At the same time, there were promises of a "transition to the future," an afterlife for members on another planet near Sirius, the brightest star in the firmament.

In 1993, the Solar Temple became the target of police attention (for illegal weapon charges) and sensational media reports in both Canada and Australia. In July 1993, Jouret and two associates received light sentences from a judge in Quebec for their attempts to buy pistols with silencers. The most sensational media reports,

calling the Solar Temple a “doomsday cult,” turned out to be right on the mark. On October 4, 1994, 46 members and four children were found dead in two locations in Granges-sur-Salvan, in Cheiry, Switzerland, and in one location in Morin, Quebec. The victims were shot and then set on fire; the leaders, who did the shootings, committed suicide. Five days earlier two former members and their infant son were murdered in Quebec.

On December 16, 1995, in a repetition of the same horror, 13 more members and three children met their death, laid out in a star pattern in the Vercors region of eastern France. The ritual killings were explained on the basis of the group’s beliefs in a new life after death on another planet. “We leave this earth to rediscover a Plane of Absolute Truth, far from the hypocrisy and oppression of this world,” said a collective suicide note. The murders in Quebec were explained as the result of the victims’ disobedience to the leaders in having a baby without permission. It is possible that Di Mambro, terminally ill, wanted to take as many with him as he could.

What is most significant psychologically but only rarely noted is that the catastrophic crisis, which eliminates most group members, is not the end of group identity and loyalty. Thus, the history of the Branch Davidians did not end in 1993. The group, which has always been small, survives, and believers in the United States and elsewhere still hold on to the teachings of David Koresh. In the Internet age, group identity lives on, as web sites maintain the beliefs and the loyalty to the dead leaders.

What we have observed is that in most cases, crises in NRMs are overcome because of the readiness on the part of members to put loyalty, solidarity, and commitment above other considerations, sometimes at high cost to themselves. We can speak of love and attachment to leaders, beliefs, and identity. At the social psychological and economic level, we can speak of investment in relationships and a lack of alternatives. Members have burned bridges to other groups and have close friends in

the group. This can be compared to life in a political party or in an underground revolutionary cell.

Identification with the group and with peers could have unique evolutionary value to humans. Attachment to kin and clan has developed over millennia of hominid development and may lead to tragedy, but most often offers tangible and non-tangible rewards.

Crisis Pastoral Counseling

James Higginbotham

Earlham School of Religion, Richmond, IN, USA

Crises

A crisis is an acute emotional and/or spiritual state, which persons perceive as overwhelming despite the use of typical coping methods and resources. Extraordinary or even hazardous events are not crises in themselves; the self-appraisal of being unable to cope is essential. Individuals, families, or groups can experience crises. Due to the frequent spiritual or religious dimension, persons in crisis often approach pastors and pastoral counselors for assistance.

Crises last no more than a few weeks. Since the level of anxiety and pain is not sustainable for a long duration, individuals and systems will reestablish a homeostasis. The outcome can be adaptive: a return to a similar precrisis functioning. Following significant crises, it is more likely

that persons will either grow – as a result of learning new coping skills and/or developing new resources – or persons will function less effectively. Therefore, crises are frequently seen as danger and opportunity. Because persons in crisis are not coping well on their own, prompt, effective intervention is crucial for reducing the negative impact, maximizing the possibility of second-order change, and increasing resilience for future distressing events.

Assessment

The assessment process of a crisis is intrinsically connected to its resolution. In the initial session or contact, caregivers must evaluate the potential for harm. Direct, clear questions are used to appraise the threat of suicide, ongoing abuse, assault, or other victimizations. If the risk of injury or death is high, the threat needs to be reduced. In hazardous situations, pastors and pastoral counselors may face ethical choices regarding the limits of confidentiality and intervention. Utilizing a hierarchy of needs, other vulnerabilities should be evaluated to help persons in crisis prioritize their response. These assessments and immediate interventions to address risks serve to stabilize the situation.

Helping persons determine whether they are in crisis involves an examination of attempted methods of resolution and resources utilized. This review may produce new options. The counselor should also explore how persons have coped in previous predicaments, using a question like, “When you’ve been overwhelmed before, what has helped you?” Strengths and an understanding of what coping methods haven’t been attempted this time may be identified.

Even if solutions don’t arise, the evaluation process can produce a change in the construal of the situation, reducing or even suspending the crisis. Persons often feel less overwhelmed when they can view their situation from a new perspective. Research indicates that the most important factors for a positive outcome from a crisis are past resolution of crises or other

significant challenges, perceived ability to resolve the current crisis, and strong social support (Hoff 2001). Therefore, reinforcement of self-efficacy and the identification of potential support systems are primary goals of crisis counseling.

There are several “*categories*” of crises, any of which of which can contribute to the perceived inability to cope. Although there is a tendency to label a crisis using a precipitating event – e.g., a midlife crisis – other factors frequently play a critical role, as was seen in the aftermath of Hurricane Katrina. Assessing each of these dimensions produces a holistic understanding of the precipitating origins of the crisis.

Situational crises tend to be unanticipated. If choices contributed to the situation, a counselor may need to help the persons explore the resulting guilt and/or shame. Survivor guilt is another common component of situational crises when death occurs. Pastoral counselors are particularly suited for these troubling aspects (potentially present in all kinds of crises) because of the redemptive, hopeful, and forgiving dimensions of religion. Types and examples of situational crises include:

- Disasters and other environmental events, from both natural and human origins
- Personal – illness, injury, unemployment, failure, material loss
- Relational – death, divorce, rape, interpersonal conflict, change in support system

Developmental. Although ordinary transitions might be partially anticipated, persons may not have prepared for their impact. Particular characteristics of a developmental event often contribute to the likelihood of a crisis: timing, e.g., atypically early or late parenting; duration, e.g., longer menopause; and the level of expectation that the transition would be challenging. Pastoral counselors may want to utilize religious rituals, which are potent resources for crises that include developmental components. Religious communities are also valuable support systems, serving a preventative and ameliorative function of developmental crises.

Sociocultural factors are often overlooked, particularly when the counselor is from a different social location. Discrimination, oppression, a systemic “Catch-22,” and economic downturns are common examples. A systems analysis is a useful method for evaluating this dimension. Often persons, groups, or institutions who should be supportive are contributing to the crisis, due to the roles of the persons involved. Power dynamics also need to be examined to identify limitations to efficacy. In many cases, persons who have experienced a crisis find solace in addressing the injustice of the sociocultural dimension.

Religious/Spiritual. Those who are acutely distressed frequently look toward religious beliefs to make sense of their experience. Confronted with their finitude, they seek meaning and a sense of control over their circumstances. However, as Pargament (2001) has described, some styles of religious coping are more effective than others. For example, belief systems that have little internal locus of control are associated with poorer problem-solving skills. A crisis of faith may ensue in any theology when transcendent assistance or presence is not evident as expected. Questions of theodicy arise and may be the primary source of distress. Even for those who are less formally religious, existential threats to freedom, personal identity, and the meaning of life may be experienced as deeply spiritual conflicts. The pastoral counselor may need to help a person assess the level of congruity among one’s worldview, practices, and embedded beliefs.

These four categories are not completely discrete and can be concurrent. For example, in addition to the apparent sociocultural and religious dimensions, the calamity of September 11, 2001, resulted in intrapsychic/systemic vulnerability that for many people raised profound spiritual questions.

Regardless of the precipitating events, people in crisis typically have experienced a loss, or the threat of loss, of something considered important. The crisis counselor will want to help them understand what has been lost, types of which include material, relational, intrapsychic, functional, role, and systemic (Mitchell and Anderson 1983).

Intervention

Establishing rapport with those who are overwhelmed requires a safe environment. Physical well-being, initiated via a risk assessment, is connected to the trust necessary for persons to feel emotionally secure enough to reflect up their distress. Reassurance that “everything will be ok” is ineffective and unadvisable. Even those in crisis usually recognize empty guarantees; in some circumstances, such assurances may lead to poorer decisions. Calm, clear communication increases the sense of safety and builds emotional attunement. Spiritual grounding is a particularly valuable resource for helping the crisis responder not overreact to anxiety. Recognizing and accounting for sociological and situational differences, including values and relational patterns, increases the effectiveness of communication.

Crises can be stressful for a caregiver, creating uncertainty as to what to do. However, respect and concern are relatively easily communicated; one need not fear saying the wrong thing even in hazardous situations like a suicide threat. Crisis counseling involves a more direct, interrogative style of engagement, particularly in assessing the nature and scope of the distress. Nevertheless, questions that can be answered with yes or no generally limit rapport. A caregiver also should steer clear of questions beginning with “why,” which may unintentionally assign blame and create unnecessary defensiveness. Although the crisis counselor seeks to make a distressed person feel understood, use of the phrase, “I understand” might be perceived as denying the uniqueness of the person’s situation.

The assessment process generally identifies concrete problems that contributed to the crisis. An intervention plan should be developed collaboratively to maximize the sense of self-efficacy. Doing something for persons that they could do for themselves is not empowering and may decrease the sense of being able to cope effectively.

Reinforcing personal and social strengths increases resilience, thus serving a preventative function. The pastoral counselor may sensitively encourage the use of religious and spiritual

resources, which not only provide comfort and strength but also help persons make sense of what has happened. One must work with the particularity of embedded beliefs, symbol systems, and relationality (Doehring 2006). As a distressed person reflects about the meaning of what has happened, it is important to listen for destructive narratives, which unnecessarily blame oneself (associated with shame) or others (scapegoating). Ameliorative and life-giving practices such as reconnecting with others and with one's core values are a critical goal. Religious communities also can model such a deliberative theology, by engaging difficult issues before crises arise.

A primary goal of the counselor is to limit the extent to which a crisis is experienced as a trauma. Persons react instinctively to traumatic events, which are severe threats to their well-being, identity, or spirit. The stress of the flight, fight, or freeze mechanisms can have long-term physiological, emotional, and spiritual effects (Yoder 2005). These potential consequences include radical suffering in which a person's own sense of humanity is diminished (Farley 1990). The report of unbearable distress for long periods is a sign of traumatization. The mere establishment of new coping mechanisms or resources will not return them to precrisis functioning and may not prevent destructive acting out or acting in. Even empathy, problem-solving, lamentation, and eschatological hope may not be sufficient for healing; justice is often required, especially for traumatized communities. Crisis counselors also must be aware of potential secondary trauma, especially when dealing with victims of violence or events that may resonate with the counselor.

Crucifixion

Krystyna Sanderson

The Blanton-Peale Institute, New York, NY, USA

Crucifixion (from Latin *crux*, cross) is a method of execution in which the condemned is tied or nailed to a cross, pole, or tree and left to hang until dead. It was employed in ancient Rome until Christianity became the state religion in the fourth century and has been used, less commonly, in various places around the world to the present day.

Christ's crucifixion is described in all four gospels and is pivotal to the Christian understanding of redemption. The Apostle Paul wrote to the church in Corinth, "For I decided to know nothing among you except Jesus Christ and him crucified" (1 Cor. 2:2). In Christian faith, Christ overcame sin and death on the cross; hence the cross becomes for Christians the symbol of life and hope.

Psychologically understood, crucifixion can be seen as the acceptance of personal suffering and the consequent realization of one's own individuation, when the ego becomes a part of the self. When Jesus on the cross cries out in the words of Psalm 22, "My God, my God, why hast thou forsaken me?" he portrays, in psychological terms, a crucial phase of individuation. Jung wrote, "Since 'the soul is by nature Christian' this result is bound to come as infallibly as it did in the life of Jesus: we all have to be 'crucified with Christ', i.e., suspended in a moral suffering equivalent to crucifixion" (Jung 1953).

Cultural Psychology

Halina Grzymala-Moszczynska

Institute for the Science of Religion, Jagiellonian University, Cracow, Poland

Cultural psychology represents a middle stage of psychological reflection between cross-cultural and indigenous psychology. All of them to various degrees take into account the fact that the cultural context in which an individual operates makes a difference for their perception of the surrounding world.

Migration and Acculturation Strategies

The cultural diversity of the world represents an obvious fact for any observer. This fact becomes even more salient when people of different backgrounds meet through both voluntary and involuntary migrations. Migration implicates acculturation changes that result from the fact that people of different cultural background come into face-to-face contact. These changes pertain to both groups. Different theoretical approaches stress the fact that cultural groups involved in acculturation might display different level of agency, as well as the fact that the acculturation process might be unidirectional or bidirectional (Rudmin 2003; Sam 2006). There are four general strategies of acculturation: *assimilation* when individuals adopt a new culture and simultaneously abandon the

original cultural identity, *integration* when individuals opt for maintaining the original culture and also adopting the new culture at the same time, *separation* when individuals maintain the original culture without seeking contacts with the new culture, and *marginalization* when no contact with the original culture is maintained and when contact with the new culture is possible. No matter what acculturation strategy is selected or possible, individuals involved in the process experience both shared similarities and marked differences between themselves and others.

The newest model of acculturation strategies *Relative Acculturation Extended Model (RAEM)* has been developed by group of Spanish scholars (Navas et al. 2005, 2007) who were researching acculturation of both African immigrants and local population in the south of Spain. Research results permit to specify seven separated domains in which different acculturation strategies might be adopted. They are the following domains: first, *political and government system* which represents social structure and hierarchies in the society; second, *labor and work* which is organization of the professional activities; third, *economic* representing earning and spending activities; fourth, *family* which described both strategies of reproduction but also system of raising children; fifth, *social* which is network of relations outside family bonds; sixth, *ideological* formed from philosophical or religious representation of the surrounding world; and, seventh, *religious* beliefs and values. Major value and novelty of the model stays with the fact that it creates space for analysis of simultaneously existing acculturation strategies (in both hosts and guest population) which are domain specific rather than universal. *RAEM* provides also a tool for better understanding why changes in some domains proceed at different pace, for example, why migrants relatively quickly adapt to political and economic realities of the new country, while family and religious conviction remain pretty untouched by changes in their living environment.

Reasons of Bias in Academic Psychology

In spite of this reality, psychology as an academic discipline is mostly pursued from one specific perspective, i.e., that of western scholars. Such a situation leads inevitably to ethnocentric attitude towards encountered diversity. The concept *ethnocentric* has been introduced by William G. Sumner in 1906 (Berry et al. 2002). It describes the tendency for using norms of one's own group as the model for perceiving other groups. The behavior of others gets evaluated and judged via one's own system of standards for what is deemed correct and proper. The assumption is supported by what is sometimes referred to as the principle of "psychic unity" of humankind, i.e., the conviction that there is a central processing mechanism inherent in all human beings and therefore that perceived diversity between people is inconsequential. The central processor remains context and content independent. Such a perception of human nature is supported by the reality of who and where the majority of psychological research takes place.

A recent content analysis study of the *Journal of Personality and Social Psychology* has clearly pointed to the fact that 99% of the articles were written in the West, with 92% of the articles coming from the United States and Canada (Quinones-Vidal et al. 2004). Theories, data, and research methods are also rooted in Western tradition. One might say that research is conducted on samples drawn from a population which is nontypical for the majority of the world's population, or even more so it can be considered as anomalous because of the differences related to wealth, individualism, and secularism. Analysis of articles in leading psychological journals in the 1994–2002 period in which culture appears as one of the keywords demonstrates that in journals devoted to experimental and cognitive psychology, this is the case for 1, 2% of the articles, in journals for clinical psychology 4, 3%, for developmental psychology —4, 3%, and in journals for social psychology 4, 8% (Norenzayan and Heine 2005).

Psychologists became concerned about the underestimated role of culture in their discipline in the 1960s. Concept of culture “usually refers to a particular group of people and includes their values, or guiding principles, and behaviors, or typical activities. Those values and behaviors are symbolized in the things that the group of people produces, such as art, music, food, and language. All those things are passed down from generation to generation” (Mio et al. 2006, p. 6).

Approach from the Perspective of Cross-Cultural Psychology

The beginning of a new field of psychology, cross-cultural psychology, which started to take seriously the cultural diversity of humanity, can be linked to the first journals in the field: *The International Journal of Psychology* in 1966 in Paris and *The Journal of Cross-Cultural Psychology* in 1970 in the United States. The main questions raised by psychologists representing this field pertain to the problem of to what degree western psychological theories describe accurately experiences and behaviors of people who are born and raised in other cultures and whether there are any culture-specific psychological constructs.

Cross-cultural psychology conducts research on the similarities and differences of people coming from different cultural and ethno-cultural groups. It also analyzes relationships between psychological, sociocultural, and biological factors, as well as changes in these factors (Berry et al. 2002). Research conducted from the perspective of cross-cultural psychology is comparative. It is conducted in two or more national, ethnic, or cultural groups. Differences found in these groups are explained by cultural characteristics of the groups. Cross-cultural psychology uses two kinds of concepts: *etic* (universal) and *emic* (local). *Etic* represents concepts which are universal in all cultures (all cultures have some kind of language, art, family structure, mythology, rituals), while *emic* represents elements which are unique to a given culture. For cross-

cultural psychologists, culture serves as an explanatory tool for encountered differences. A major concern of cross-cultural psychology is to find research methods that allow for the “psychic unity” of humanity to be revealed in spite of cultural differences between people living in different contexts. Lots of efforts are placed in finding test materials and research tasks that can be used across cultures.

Approach from the Perspective of Cultural Psychology

Cultural psychology represents an attempt to take culture more deeply into account. In contrast to cross-cultural psychology, it does not presume the premise of “psychic unity” that to some extent permeates approaches of cross-cultural psychology. According to Richard A. Shweder (1991), “Cultural psychology is the study of the way cultural traditions and social practices regulate, express, transform, and permute the human psyche, resulting less in psychic unity for humankind than in ethnic divergences in mind, self, and emotions” (p. 1). For cultural psychology humans are constructing meanings in a sociocultural environment. This environment becomes an intentional world. Objects existing in the world are receiving meaning through human involvement with them and reactions to them by members of given culture. “Cultural psychology is a study of intentional worlds. It is a study of personal functioning in particular intentional worlds” (Shweder 1991, p. 3) An individual can be understood correctly only in the surrounding of her environments. The role of the psychologist is to discover both the meaning which gets attributed by an individual to her environment and the influence of this environment on the individual. What cultural psychology shares with its predecessor cross-cultural psychology is the fact that the majority of the research has been conducted by western scholars, applying western-based psychological concepts and theories assuming a universal character (Gregg 2005).

Approach from the Perspective of Indigenous Psychology

Criticism of universality in psychological theories came from psychologists from Africa, Asia, Latin America, and the Middle East, who had been trained in the West. Upon returning to their countries of origin, they faced problems and numerous difficulties when attempting to apply supposedly universal theories in their home setting. These difficulties have stimulated a desire to create more adequate means and methods based on the understanding “that each culture should be understood from its own frame of reference, including its own ecological, historical, philosophical, and religious context” (Kim et al. 2006, p. 5). A review of various definitions of indigenous psychology points to the fact that “the definitions all express the same basic goal of developing scientific knowledge system that effectively reflects, describes, explains, or understands the psychological and behavioral activities in their native contexts in terms of culturally relevant frame of reference and culturally derived categories and theories” (Yang 2000, pp. 245–246). Indigenous psychology advocates a descriptive approach according to which it is necessary to first understand how people function in their natural context. The need for such an approach comes from the fact that some of the cultural facts present in a specific cultural context cannot be understood correctly unless analyzed from the perspective of that cultural context. An example of massive decline of church attendance of Polish immigrants after their arrival to Great Britain (statistics provided by the Polish Catholic Mission in Great Britain claim that only 8% of Polish immigrants practice their religion while in Britain, with the remaining 92% loosening their ties with Catholicism) cannot be correctly understood without analyzing the cultural differences in which religious practices are taking place in Poland and in the United Kingdom. The important aspects here of being in a new cultural context are multiculturalism and religious heterogeneity in Britain as contrasted with cultural and religious

homogeneity in Poland, flexible and private patterns of religious practice amongst the native British population in contrast to the strong pressure in Poland to attend religious services because of a feeling of national identity based on religious affiliation (Poles-Catholic) and boredom and lack of understanding for Poles when experiencing English-language church services in Britain, instead of services conducted in the mother tongue in Poland. In conclusion, for both research on and psychological clinical services that address human religiosity taking place in different contexts, both cultural psychology and indigenous psychology seem to offer a much more promising ground than cross-cultural psychology.

Culture Heroes

David A. Leeming

University of Connecticut, Storrs, CT, USA
Blanton-Peale Institute, New York, NY, USA

Most cultures have culture heroes. Typically, the culture hero assists the creator by living with the newly created humans in the world and teaching them religious rules and ceremonies and ways of survival. In short, the culture hero, unlike the warrior hero or the questing hero, establishes the community's institutions and traditions; he literally establishes "culture." This is not to say that the culture hero cannot also become a warrior or a questor. The culture hero sometimes takes the side of the people against the creator. In the interest of his people and their survival, he can, for instance, steal fire, as Prometheus does from Zeus. Or he can be a trickster who sometimes introduces unpleasant aspects of human life. Coyote, in a Maidu Indian myth, brings death. In matrilineal

cultures the culture hero can be female, as in the case of the sisters "Life Bringer" and "Full Basket," who teach the Acoma Indians how to live.

Often the culture hero's powers can be attributed to divine origins. He can be conceived miraculously through divine intervention in the human world. This is the case with Jesus and the Buddha, both in a sense culture heroes, as they teach the people new ways of survival, albeit spiritual rather than material survival. Culture heroes make their societies safe by struggling against monsters and can even die for their people, sometimes transforming themselves into food that will ensure survival, as in the case of Jesus, who becomes spiritual food, or the many Native American versions of Corn Mother or Father, who become sustenance for the body.

The culture hero, then, nurtures the given culture and, metaphorically, *is* the culture, the ultimate embodiment of what the culture is. It is this fact that leads to the psychological meaning of the culture hero. The culture hero embodies the very soul of a culture. He represents much more than the ego, the central reference point of the collective consciousness of the culture. Rather, he is the embodiment of the culture's Self, i.e., the collective totality of the culture's unconscious and conscious psyches, fighting the monsters that live within us all and establishing the balance and reason we need to survive in the world. To give an example, Carl Jung wrote of the Christ as the symbol of Self, and insofar as Jesus can be seen as a culture hero, he becomes for Christians the Self, the wholeness which individuals and the culture as a whole strive to discover within. The same could be said of Muhammad for Muslims or Manabozho for several Native American groups or the Buddha for Buddhists. Ultimately, the culture hero is who we are or who we could be. The culture hero is Self-knowledge.

Cupid and Psyche

Alice Mills

University of Ballarat, Ballarat, VIC, Australia

Myth of Cupid and Psyche

The myth of Cupid and Psyche (Cupid is sometimes known by his Greek name, Eros, and is sometimes called Amor, meaning “love”) is a story within the longer story of Apuleius’ *The Golden Ass*. This longer story is a witty, obscene, and ultimately religious tale of bodily and spiritual transformation. Within it, the story of Cupid and Psyche ends with the transformation of the human princess Psyche to goddess. Psyche was the youngest daughter of a king and queen who offended Venus, goddess of beauty and sexuality, by claiming that she is no more beautiful than their child. Venus sent her son, Cupid, to make Psyche fall in love with the worst of men, but he fell in love with her instead. Apollo’s oracle prophesied that she would marry a monster and when her parents left her on a mountaintop to meet her fate, Cupid had her brought to his palace where they lived blissfully. Psyche never saw her husband and only met him at night in bed. If she had been able to endure this condition until she gave birth to their daughter, it would have been lifted and she would have become a goddess. Psyche’s two jealous elder sisters visited her and persuaded her that she was married to a monstrous snake, which she must kill. Psyche took a lamp and knife, but when she saw the glorious god asleep in bed, she fell deeply in love with him, wounding herself on his arrow. She burned his shoulder with a drop of oil from the lamp and Cupid left, reproaching her for her disobedience. Psyche sought the aid of

the gods to find her beloved Cupid, but in vain, until the angry Venus set her the task of sorting a heap of seeds, an impossible task for a human that was achieved for Psyche by some helpful ants. Then Venus ordered her to fetch some wool from her lethally aggressive golden sheep. A reed of the stream advised Psyche to wait until evening when the sheep were calm, and then she picked up the wool that the sheep had lost in the field. The next task was to bring water back from the source of the Styx, fatal river of death, and here Psyche was helped by Jupiter’s eagle. Finally Venus sent her to the underworld to bring back a box of beauty from Persephone. This time Psyche was helped by a tower which told her how to enter the underworld and leave it safely, taking coins for the ferryman and bread for the guardian dog, Cerberus, and instructed her not to aid the dead who would plead for her help from the waters of the Styx. Following this advice, Psyche gained the box but opened it along the way and fell unconscious. She was brought back to life by Cupid, and Jupiter raised her to goddess. Their child was Voluptas (“pleasure”).

Neoplatonic Interpretation

Apuleius, who wrote this story in the second century CE, was educated in Platonic philosophy at Athens and deeply interested in the Egyptian mysteries of Isis and Osiris; the main story ends with initiation into these mysteries. Apuleius’ tale of Cupid and Psyche has long been understood as a Neoplatonic allegory of the ascent of human consciousness from earthly to divine love. In another of his works, the *Apologia*, Apuleius speaks of two Venuses, one the goddess of carnal love and the other of a higher form of love. “Psyche” is a Greek word which had by Apuleius’ time become roughly equivalent to the Christian term, “soul.” Classical representations of Psyche show her with butterfly wings, alluding to her transformation to goddess. To interpret the whole myth of Cupid and Psyche in terms of the Neoplatonist ascent of human consciousness, however, divests it of *The Golden Ass*’s sexual urgency. His Cupid is a splendidly embodied deity who bears the

weapons that inflict compelling sexual desire as they wound, and there is little evidence that Psyche gains enlightenment or moves from her earlier state of sexual desire to a spiritual form of love at the end of her story. In fact she commits more than one act of disobedience to the gods and is ultimately rescued by Cupid rather than gaining him as the ultimate prize in a hero-quest.

Christian Interpretation

The Neoplatonic interpretation of Apuleius' tale proved easy to adapt into a Christian framework where Psyche was equated with the soul. Again the tale had to be desexualized in order to fit the Neoplatonic preference for the ideal and spiritual over the material and bodily. Psyche's malicious revenge on her sisters (whom she sends to their deaths, telling them that Cupid is in love with them) is censored from this kind of interpretation, as is the birth of Voluptas. Instead, Neoplatonic Christian interpretations focus on the ordeals and Psyche's close encounters with death and identify Cupid with Christ as the God of love. This process of desexualizing the myth is comparable to the allegorizing of the Old Testament's equally sexual Song of Songs as a celebration of Christ's love for the Church.

Jungian Interpretation

Apuleius' story has drawn the attention of two eminent Jungians, Marie-Louise von Franz and Erich Neumann, both of whom interpret it as depicting the development of consciousness. For Neumann, Venus is the archetypal Great Mother; Psyche must differentiate her consciousness and take responsibility for her own actions. Psyche's true act of heroism is to disobey Cupid and look at him by lamplight. Von Franz speaks of Psyche as an anima figure within a man's unconscious: in this interpretation, it is the man who must differentiate his consciousness. As Betsy Hearne points out, both of these Jungian interpretations run into

trouble when Psyche achieves apotheosis, joining what for Jungians would be the collective unconscious of the Olympian pantheon. As with the Neoplatonic interpretation, there is also the issue that Psyche does not display very much wisdom along her path of ordeals. Instead, she despairs and disobeys, ultimately sending herself into a sleep of death from which the god must awaken her rather than achieving an enlightened state of consciousness.

Freudian Interpretation

Apuleius' myth is a forerunner to the fairytale, *Beauty and the Beast*. As a Freudian interpreter of fairytales, Bruno Bettelheim pays close attention to the sexual implications of *Beauty and the Beast* in his *The Uses of Enchantment*. In his reading, this fairy tale alludes to the pubescent girl's anxious fantasies of sex with a man, which she imagines as bestial. Such a reading of Cupid and Psyche would give full weight to the birth of Voluptas and also to the jealous sisters' fabrication that Psyche has inadvertently married a monstrous (phallic) snake. Bettelheim's discussion of Apuleius' myth, however, accords surprisingly well with those of the Jungians, understanding it as an allegory of the gaining of higher consciousness. Bettelheim sums up the story as dealing with "the difficulties man encounters when the highest psychic qualities (Psyche) are to be wedded to sexuality (Eros)" (Bettelheim 1976, p. 293). This reading runs into exactly the same problems as before, that Apuleius' Psyche exhibits suicidal despair and disobedience but can hardly be seen as a model of the enlightened consciousness.

Curanderismo

Sana Loue

Faculty Development and Diversity, Department of Bioethics, Case Western Reserve University School of Medicine, Cleveland, OH, USA

Origins

Curanderismo is a healing system that is prevalent throughout Latin America. Although reliance on this system of care by individuals of various Latino heritages in the United States has been documented, the prevalence of its use is unclear. This approach to healing has often been referred to somewhat disparagingly as “folk medicine” or “folk healing.”

Healing activities within the tradition of curanderismo are performed by (male) curanderos and (female) *curanderas*; all three terms derive from the Spanish verb *curar*, meaning to heal. (The remainder of this discussion will utilize the term *curandero* to refer to both male and female healers in this tradition.) Curanderos are to be

distinguished from *parteras*, women who serve as midwives, although they are most frequently not registered as such; *yerberos*, who heal exclusively through the use of herbs; *sobadores*, practitioners who devote their attention to sprains and muscle aches; and *hueseros*, or bone-setters. Individuals who practice any of these traditions are believed to be endowed with a *don*, or gift, of healing; adherents believe that the *don* is bestowed on the individual by God, while opponents of the tradition believe it is conferred by Satan.

Scholars have asserted that, as practiced by some believers, curanderismo often reflects six major influences: Judeo-Christian traditions, early Arabic medicine, beliefs associated with European witchcraft, Native American healing practices, current beliefs relating to spiritualism, and modern medicine. Mexican curanderismo is said to derive specifically from the influences of Spanish, indigenous Mexican, and African healing practices. The resulting system of healing is premised on religious beliefs relating to the maintenance of harmony between nature, the self, and spirit. Disease or illness is viewed as the result of a lack of harmony between the individual and his or her environment; the *curandero* is charged with the task of removing this imbalance and restoring harmony.

Illness Causation and Healing Practices

The lack of harmony between the individual and his or her environment may result from physical, psychological, social, and/or spiritual causes. Illnesses are recognized as originating through the action of natural agents, as is the case with tuberculosis disease, or through the action of a supernatural agent (e.g., a *bruja*, or witch), as may be the case with unemployment, marital difficulties, and alcohol dependence. Curanderos can address the presenting problems and effectuate healing using any of three levels, or avenues, of treatment: the material, or physical, level; the spiritual level; and the mental level. Frequently, treatment efforts

are implemented at all three levels, consistent with the view that health and illness are manifestations of interactive processes at each of these levels.

Healing targeting physical illness at the material level often relies on rituals involving the use of herbs, fruits, eggs, and oils. Treatment may also include massage or prayer; a minority of curanderos will provide vitamin injections. As one example of available treatments, efforts to detoxify clients who are suffering from alcoholism may include the use of passion flower, linden flower, wormwood, rose petals, evening primrose, and various additional flowers and herbs. In situations in which the illness is believed to have resulted from an imbalance of hot and cold properties, the curandero may attempt to restore balance by prescribing a treatment that will eliminate the excess or augment the deficiency. The “hot” or “cold” nature of a condition or treatment is an inherent property. Family members and individuals within the client’s social network are often enlisted to aid in the healing process.

Healing at the spiritual level requires that the curandero enter into a trance in order to establish a connection between the material and spiritual domains. The curandero essentially functions as a medium through which the spirits can work to effectuate the requested healing. The spiritual forces are able to cause, diagnose, and cure illness on the spiritual level. Clients may participate in cleansing rituals to address the need for healing at a spiritual level.

Less commonly, the curandero may effectuate healing on the mental level. This requires that the curandero channel mental energy from his or her mind directly to that part of the client in need of treatment. It is believed that through this focused mental energy, the curandero is able to halt the growth of the illness-affected cells in the client’s body and promote the healing process.

Common illnesses for which individuals may seek treatment from a curandero include *empacho*, a digestive blockage that is often treated with teas made from specified herbs; *bilis*, an ailment thought to be caused by excessive bile resulting from extreme anger that can be cured

through the use of prescribed laxatives; and *mal ojo*, or “evil eye,” for which treatment may be effectuated through a ritual involving a raw egg.

Several illnesses for which curanderos may be consulted are clearly psychological or emotional in origin. These include *susto*, or “fright,” and *nervios*, literally translated as “nerves.” *Susto* is believed to result from a single specific incident, such as witnessing a death or accident, being involved in an accident, or being suddenly surprised or frightened. Crying, trembling, and insomnia are common symptoms, but *susto* may also present as a lack of appetite or vomiting. Prayer, herbs, and massage are thought to be beneficial.

Depending upon the particular Latino subgroup, *nervios* may refer to the disease *nervios* or to specific symptoms of an illness. Women, sensitive individuals, and older adults are believed to be particularly susceptible to the disorder. *Nervios* can be brought about by family problems, worry, stress, and anger and may be manifested by headache, depression, yelling, worry, pacing, high blood pressure, insomnia, and loss of control. Treatment may consist of counseling, pills, prescribed teas, speaking to another person, and/or calming oneself. Illnesses such as *susto* or *nervios* may or may not be indicative of symptoms that would constitute a mental illness as delineated by the *Diagnostic and Statistical Manual* used by Western-trained mental health care providers for the diagnosis of a mental illness or disorder. Research suggests that some individuals reporting *nervios* or *ataques de nervios*, for example, may be suffering from an anxiety disorder.

Benefits

Individuals with serious medical problems are often referred by the curandero to Western medical providers. Depending upon the nature of the illness, however, patients may also consult with curanderos as well. Clients may rely on both approaches for various reasons. First, clients may be unable to afford the cost of a medical doctor and will delay or avoid such care unless

the illness is perceived to be a serious one necessitating such attention. Second, because curanderismo views the mind and body as inseparable and illness is to be addressed by examining the total context in which it occurs, a curandero may focus on elements of an illness that may not be attended to by medical doctors, such as the underlying stress that is giving rise to the client's headaches. Third, the curandero's reliance on rituals to address the supernatural origins of a situation may help to restore the client's hope, such as in the case of unemployment or marital disruption.

Consultation with a curandero brings other advantages as well. The attribution of the illness to an external source, whether natural or supernatural, relieves the individual of blame for his or her condition. The curandero's enlistment of the client's family and friends to assist in the implementation of the treatment helps to create a loving and supportive environment through which the client can progress towards healing. In situations in which the illness does result from the client's own actions, the curandero can invoke the aid of spiritual forces, thereby providing the client with an additional source of strength, support, and hope.

Various similarities have been noted between curanderismo and Western psychotherapy. These include the provision to the client of opportunities to identify symbols that have great meaning to him or her and to experience change through the manipulation of those symbols. Each modality also offers the client the opportunity to explore and reevaluate the perceived expectations of his or her support system.

Cybele and Attis

Lee W. Bailey

Department of Philosophy and Religion, Ithaca College, Ithaca, NY, USA

Cybele was a goddess who originated around 1200 BCE in Pessinus, Phrygia, near Mount Agdistis, in central Asia Minor, now Turkey. This mountain was personified as the Great Mother Goddess Cybele of Asia Minor, Mother Earth. She had dominion over wild beasts – in art her throne was flanked by lions or she drove a chariot pulled by lions. She was a goddess of caves and was worshiped on mountain tops (Vermaseren). Known as "The Mother of All Gods," her religion spread around the Black Sea, and to Greece by the sixth century BCE, where she was celebrated by a Homeric Hymn to "The Mother of the Gods":

Sing to me O Muse, clear voiced daughter of great Zeus, Of the mother of all gods and of all men. In the din of rattles and drums and in the sound of pipes she delights. In the howl of wolves and the roar of glaring lions, in resounding mountains and wooded glands she finds her joy. (Homeric Hymn 14)

[wikipedia.org/wiki/File:Cibeles_con_Palacio_de_Linares_closeup.jpg](http://en.wikipedia.org/wiki/File:Cibeles_con_Palacio_de_Linares_closeup.jpg))

Cybele’s religion spread west during the Hellenistic era. Statues of her were found along the west coast of Asia Minor, in the ruins of Pergamon, and in Greece. She reached Rome during the early Empire. She was given a temple on the Palatine in 191 BCE, where her ceremonies were held, and where a great number of statuettes of her son Attis were later found (Roller 2005). From Rome the cult spread around the Empire (Fig. 1).

The archaic dimension of Cybele and Attis is the mythic enactment of belief in the death of a fertility god, Attis, symbolizing the onset of winter and the apparent death of plants. Then his resurrection in the spring brings life to plants needed for food and the ongoing reproduction of animals. The goddess Cybele symbolizes the background metaphysical power to keep life going through reproduction. It was told in many religions of the dying and rising gods, such as Ishtar and Tammuz in Babylon.

Later Cybele and Attis were notable among what came to be called the “Mystery Religions” from the East, such as Mithras, Isis, Demeter, Dionysus, and Orpheus (Godwin 1981). Their ceremonies were secret, but apparently offered immoral life to believers, which was a new, appealing element in religion at the time.

During the Hellenistic age, Cybele was increasingly associated with the myth of Attis. Legend says that he was a son of the Cybele’s earthly incarnation Nana, who miraculously conceived him by eating a pomegranate, a fertility image. So he was a child of a virgin, and born on December 25th. When the handsome young Attis was about to be married to the princess of Pessinus, the jealous Agdistis (Cybele) appeared in her power. Attis went mad and castrated himself (Pausanias 1935, Vol. 7, p. 19). Attis became a fertility god, the mythic consort and son of Cybele, a castrated, dying, and rising god of the Great Mother (*Magna Mater*) Goddess. But his castration was unique and controversial. Cybele and Attis remained prominent until the fourth century CE. In Rome, the priests were called *Galli*. In Greece, they were called the *Corybantes*. Today a stone statue of Cybele in Madrid in a chariot pulled by lions is in the *Plaza de Cibeles*. A statue of Attis with bronze light rays on his head is in the Vatican Museum.

Cybele and Attis’ feverish 5-day celebration in the Roman Empire was in March. First was a day of mourning, when a pine or fir tree was cut, following the sacrifice of a ram at its base. It was carried through the streets by her priests and followers, wrapped with woolen bands, and buried, representing Attis’ death. The second day was full

of agitated music, dance, and worked up to a passionate intensity with flutes, tambourines, and cymbals. Some flagellated themselves with whips. The third day, the vehement enthusiasm continued until some zealous males committed bloody self-castrations. The severed genitals were thrown on Cybele's statue to offer their blood and reproductive energy to the goddess. Severed genitals of bulls or rams were also cast at her feet, and all were later buried in a cave devoted to her. The fourth day was one of joyful music and dancing ("*Hilaria Matris Deum*") to celebrate Attis' resurrection. People waved reeds, perhaps to symbolize phallic and vegetative fertility, seen as resurrection. Finally came a day of rest (Vermaseren 1977, pp. 113–16).

Another bloody Attis rite, similar to that in Mithraism, was the *taurobolium*, where a pit was dug and covered by a strong grate. A priest stood under the grate and a bull was sacrificed so that the bull's blood ran down on him. He drank the blood and was respectfully saluted from afar, for "A bull's inferior blood has washed him clean" (Vermaseren 1977, pp. 102–103). Poorer people used a ram in a *criobolium*, to be "washed in the blood of the lamb." Some washed in the bull's blood were priestesses of Cybele (Vermaseren 1977, p. 109). They were seen as "born again." This was seen as the sacrificial blood of the god Attis, giving the priest the strong life-power of the bull and conferring on him, and, as in the mystery religions, both a glimpse of the divine and assurance of eternal life (Godwin 1981, pp. 34, 111).

Attis and his priests were notable among cults of the dying and rising gods for being eunuchs. Making men into castrated eunuchs involuntarily was surprisingly common in history worldwide. Most were involuntary, often war prisoners, slaves, or guards for a king's harem. Some were boys castrated to be falsetto singers called "castrati." Often in a king's palace eunuchs were servants who would not have a family that he could gather into a rebellious faction or for whom he might seek positions and wealth. The last surviving imperial eunuch of China died in 1996

Cybele and Attis, Fig. 2 Statue of a reclining Attis at the Shrine of Attis, "Campus of Magna Mater in Ostia, near Rome". (This figure is licensed under the Creative Commons Attribution 2.0 Generic license (http://en.wikipedia.org/wiki/File:Statue_of_a_reclining_Attis_at_the_Shrine_of_Attis_2.jpg))

(Eunuch). Castration is tied up with power and pleasure and their denial, perhaps sadism and masochism, but not as clearly as one might think. If a eunuch lost his testicles only, he lost sperm that causes pregnancy, but could still have sex, because prostate gland inside body still produces semen ejaculated through an erect penis, now without sperm. In the ancient world some women preferred to have sex with a eunuch, for it made pregnancy impossible. But some eunuchs lost both testicles and penis. One explicit sculpture of Attis shows the loss of both (Vermaseren 1977, p. 44). Religious castration is intended to take the man away from fleshly desires and toward a more transcendent spiritual divinity. Circumcision has been seen by some as a sublimated castration (Fig. 2).

Psychologically the question arises why the male militarist Romans imported and honored the more feminine Cybele and Attis, and why Emperor Augustus granted her the title of Supreme Mother of Rome, a national goddess. Perhaps Roman imperialist and macho culture was so aggressive and domineering that they needed a feminine balance for the Roman collective unconscious. The powerful empire's masculine tone seems to have needed more feminine *anima*, so perhaps this is why Cybele, along with Isis and other goddesses, were brought to Rome, on the advice of the revered Greek Delphic Oracle. Godwin says that "their act had a psychological rightness, involving an acceptance of irrational and uncontrollable forces" or unconscious needs not met by the strong ego-dominated male warrior Roman society (Godwin 1981, p. 110). To include her self-castrating son implies deep collective feelings, perhaps for a non-macho Roman subpopulation. The priests of Attis were known for their effeminate dress, white face makeup, bleached hair, earrings, and behavior that attracted mockery and scorn in Rome (Vermaseren 1977, p. 97). Although this psychological balance may have been needed unconsciously, many Romans laughed at the effeminate Attis priests. The Roman Senate at one point prohibited the participation of Roman citizens in certain Cybele rituals (Roller 2005, p. 2110). But it seems that the old patriotic religions of the state's divine Emperor were losing their emotional grasp, and the mystery religions offered more spiritual depth. Attis' priests taught the spiritual view that they were freed of lust, and thus became Wise Ones' (*Sophoi*), Pure Ones (*Purissimi*), or Holy Ones (*Agnoi*) (Vermaseren 1977, p. 97). They offered not just political loyalty, but ego orientation to the immortal, mysterious self.

But psychologically, it is apparent that the Attis practice is another version of what became Freud's Oedipal complex. In these Dying and Rising Gods religions, the goddess was the dominant figure and her beloved was the subordinate victim who died and was resurrected. Attis was born from Cybele with no father involvement. He is her son, and when he is about to marry another woman, his mother Cybele is furiously jealous

and releases all her powers that shock him into castrating himself. The self-castration becomes a sign of his willingness to avoid becoming a man and father, and remain a devotee of his Great Mother – or even become a transvestite, identifying with his mother's gender. This keeps him passively devoted to her. The ancient ritual was a remarkable acting out of this archetypal pattern of mother and son bonding. Crude and violent as it was, perhaps this was an extreme psychological reaction against the brutal militarism of many Roman men, cheering at the lions ripping up human victims in the Coliseum.

This collective aggressive – passive dynamic may have well triggered a spiritual reaction among Christians who adopted Plato's Greek metaphysical split between mind, flesh, and spirit. This would have been part of the Christian rejection of the "pagan" belief in fertility gods and goddesses that became so bloody with sacrifices. Though Christians rejected the violence and raised spirituality above bodily desires, they still were so immersed in the old mystery religions that the Gospel authors apparently adopted the ancient archetypal elements of the older traditions of virgin birth, sacrificial death, and resurrection. This theology would fit Jesus into the beliefs about transcendent deities of the time, but also stopped the literal blood sacrifices, turning them into eating the body and drinking the blood of the savior deity symbolically as bread and wine. The question of the extent to which Christianity borrowed images from earlier religions is debated by those who see Christianity as unique. But it is clear, as world religion scholars know that religions commonly borrow archetypal images and synthesize, blending borrowed elements with unique features. Christianity borrowed Jewish themes such as the prophet and messiah, and added the new element of welcoming believers of all ethnic groups and social classes. Surrounded by religions that told of virgin birth and resurrection, such as Cybele and Attis, it is not surprising that they appear in Christianity, though spiritualized and detached from the goddess fertility rites of the past.

But monotheistic religions are intolerant of polytheism, and maintain the patriarchal social pattern based on a Father God, repressing

women whom the goddess religions had honored. Roman Catholic priests are required to be male and celibate, which is intended to raise them above the reproductive life and see themselves as more pure. Cybele and Attis suggest themes from mystery religions in the background.

Daimonic

Stephen A. Diamond
Center for Existential Depth Psychology Los
Angeles, Los Angeles, CA, USA

The contemporary term “daimonic” (Latin spelling *daemonic*) is based on the archaic Greek word *daimon* (*di-mone*). The genesis of the daimon idea is decidedly difficult to pin down. Empedocles, the fifth-century BCE pre-Socratic Greek philosopher, employed this term in describing the psyche or soul; to be even more precise, he identified daimon with self. Some classical scholars say *daimon* was used by writers including Homer, Hesiod, and Plato as a synonym for the word *theos* or god. Still others point to a definite distinction between these terms: *daimon* referred to something indeterminate, invisible, incorporeal, amorphous, and unknown, whereas *theos* was the personification of a god, like Zeus or Apollo. The daimon was that divine, mediating spiritual power that impelled one’s actions and determined one’s destiny. It was inborn and immortal, embodying all innate talents, tendencies (both positive and negative), and natural abilities. Indeed, one’s daimon manifested as a sort of fateful “soul” which spurred one on toward good or evil. The earliest pre-Christian conception of daimons or *daimones* considered them ambiguous – rather than exclusively evil – beings and predates even the great philosophers of ancient Greece.

Minoan and Mycenaean daimons were seen as attendants or servants to deities, rather than as deities themselves, and were imagined and represented as half-human/half-animal figures, exemplified by the fearsome Minotaur of Crete.

It was believed during Homer’s day (circa 800 BCE) that all human ailments were brought about by daimons. But daimons could also cure, heal, and bestow the blessings of good health, happiness, and harmony. Plato (428–347 BCE) alluded to the daimonic realm in his writings, deeming the daimon the noblest aspect of the psyche present in everyone and referring to the great god of love, Eros himself, as a powerful daimon: “All that is daemonic lies between the mortal and the immortal. Its functions are to interpret to men communications from the gods – commandments and favours from the gods in return for men’s attentions – and to convey prayers and offerings from men to the gods. Being thus between men and gods the daemon fills up the gap and so acts as a link joining up the whole. Through it as intermediary pass all forms of divination and sorcery” (cited in Diamond 1996/2007, p. 69). According to Plato, seeking spiritual wisdom and truth honors one’s daimon, while inordinate preoccupation with worldly matters desecrates it. Perhaps the most famous example of the daimon in action can be found in Plato’s story about the treasured *daimonion* of Socrates: a supposedly supernatural, metaphysical (i.e., spiritual), inner “voice” or intuitive knowing which dissuaded Socrates since childhood from making

bad decisions but, ultimately, brought about his indictment, trial, and demise for teaching his students “false *daimonia*.”

C. G. Jung (1968) points out that “the Greek words *daimon* and *daimonion* express a determining power which comes upon man from outside, like providence, or fate, though the ethical decision is left to man” (cited in Diamond 1996/2007, p. 70). The original Greek word *daimon*, notes Jung’s disciple M. L. von Franz (1985), “comes from *daiomai*, which means ‘divide,’ ‘distribute,’ ‘allot,’ ‘assign,’ and originally referred to a momentarily perceptible divine activity, such as a startled horse, a failure in work, illness, madness, terror in certain natural spots” (cited in Diamond 1996/2007, p. 70). She points out that “in pre-Hellenic Greece the demons, as in Egypt, were part of a nameless collectivity” (cited in Diamond 1996/2007, pp. 66–67). In the words of another insightful scholar, “Plutarch reveals to us the function of these *daimones*. They are the source in us of emotions good and bad” (cited in Diamond 1996/2007, p. 69). The implications of this statement for the practice of psychology and psychiatry are profound.

Daimons, Demons, and Devils

Daimons, at first, were potentially both good and evil, constructive and destructive, depending in part upon how the individual would relate to them. But one of Plato’s pupils, Xenocrates, separated the gods and daimons, shifting the destructive aspects of the gods onto the daimons. Thus began the gradual degradation of the *daimon* into our modern misunderstanding of the *demon* as exclusively evil and the ascendancy of the Judeo-Christian conception of the Devil as evil incarnate. Indeed, our modern English terms “demon” and “demonic” are derived from the Latin spelling of this classical Greek concept popularized during the Middle Ages: *daemon* and *daemonic*. During “the Hellenistic and Christian eras,” writes Rollo May (1969), “the dualistic split between the good and evil side of the daimon became more pronounced. We now have a celestial population separated into two camps – devils

and angels, the former on the side of their leader, Satan, and the latter allied to God. Though such developments are never fully rationalized, there must have existed in those days the expectation that with this split it would be easier for man to face and conquer the devil” (cited in Diamond 1996/2007, pp. 70–71). Around the rise of Christianity, the old daimons started to disappear and their ambiguous Janus-like nature torn asunder. “Evil” and “good” were neatly divided, and the daimons, now divorced from their positive pole, eventually took on the one-sided, negative identity of what we today refer to as “demons.”

For millennia, the enigmatic concept of the daimonic lay lost in relative obscurity, recognized and valued by only a few astute artists and philosophers. But the daimonic as a vital existential and psychodynamic model was resurrected in the twentieth century by several prominent theologians and psychologists, notably C. G. Jung, Paul Tillich, and Rollo May. Clinical psychologist and psychoanalyst Rollo May (1969), following the lead of his friend and mentor, existential theologian Paul Tillich, defined the *daimonic* as

any natural function which has the power to take over the whole person. Sex and eros, anger and rage, and the craving for power are examples. The daimonic can be either creative or destructive and is normally both. When this power goes awry, and one element usurps control over the total personality, we have “daimon possession,” the traditional name through history for psychosis. The daimonic is obviously not an entity but refers to a fundamental, archetypal function of human experience – an existential reality. ... (cited in Diamond 1996/2007, p. 65).

For May, much like the earliest Greeks, Egyptians, Hebrews, and Hindus, the daimonic is an essentially undifferentiated, impersonal, primal force of nature incorporating both the *diabolic* and *divine* aspects of being – without deeming them mutually exclusive.

Evil, Creativity, and Spirituality

This numinous, archetypal, transcendent *coniunctio oppositorum* of the daimonic resurfaced in contemporary culture in art too, as

in the case of Hermann Hesse (1965) describing the paradoxical deity Abraxas in his book *Demian*. And the intensely passionate creative and destructive drives of the daimonic on the individual can be most clearly observed in the lives and works of prodigious artists such as van Gogh, Beethoven, Picasso, Melville, Jackson Pollock, Richard Wright, and Ingmar Bergman, among many others. Indeed, there has always been a close link between creativity and the daimonic, as described by Jungian analyst M. Esther Harding (1973), who writes that

the poets of all times have felt themselves to be filled with a divine influx. . . . For a short space of time such an individual feels himself to be made whole through submitting to possession of his being by a power greater than himself. . . . There is no doubt that life is renewed through contact with these instinctive depths, dangerous though such a contact [can be]. . . . Individuals who have had such experiences assert that they attained a sense of redemption. . . . through such a consummation of union with the daemonic force, which they conceived of as God. (cited in Diamond 1996/2007, p. 136)

The archetypal notion of the daimonic, while remaining unknown to most moderns, subtly informs much of what we today refer to as “depth psychology”. For example, psychiatrist C. G. Jung’s Analytical Psychology is founded upon and incorporates the original ambivalent quality and possession-prone nature of the daimonic, as evidenced in his definition (1945) of *demonism*:

Demonism (synonymous with daemonomania = possession) denotes a peculiar state of mind characterized by the fact that certain psychic contents, the so-called complexes, take over the control of the total personality in place of the ego, at least temporarily, to such a degree that the free will of the ego is suspended. . . . Demonism can also be epidemic. . . . The epidemic form includes the induced collective psychoses of a religious or political nature, such as those of the twentieth century. (cited in Diamond 1996/2007, pp. 97–98)

Jung’s classic conception of the “shadow” is directly related to that of the daimonic in its bipolar potentiality for destructive possession, creativity, and spirituality. The daimonic model undergirds, transcends, and remains closer to

Jung’s earliest conception of the *shadow*: it is a unified and wholistic paradigm incorporating (but not necessarily differentiating between) the Jungian notion of the *shadow* together with Eros, Thanatos, the id, libido, and the archetypes of anima, *animus*, and the *self* while existentially retaining “the decisive element, that is, the choice the self asserts to work for or against the integration of the self” (May cited in Diamond 1996/2007, p. 105). Like the shadow, the daimonic only becomes evil (i.e., demonic) when we begin to deem it so and subsequently suppress, deny, drug, or otherwise strive to exclude the daimonic from consciousness. In so doing, we unwittingly participate in the *process of evil*, potentiating the violent eruptions of anger, rage, social destructiveness, and assorted psychopathologies that result from the daimonic reasserting itself, with a vengeance, in its most negative forms.

However, the *daimonic*, unlike the *demonic*, is as deeply involved in the process of creativity as evil. As May (1969) explains, “the daimonic was translated into Latin as *genii* (or *jinni*). This is a concept in Roman religion from which our word ‘genius’ comes and which originally meant a tutelar deity, an incorporeal spirit presiding over the destiny of a person, and later became a particular mental endowment or talent” (cited in Diamond 1996/2007, p. 262). When we consciously choose to constructively integrate the daimonic into our conscious personality, we participate in the metamorphic *process of creativity*. This movement toward what Aristotle termed *eudaimonism* – the ability to live happily and harmoniously with the daimonic – is also an essential aspect of any authentic spiritual development. Spirituality, indeed, can be fundamentally defined as *a capacity to love the daimonic*. This *amor fati*, as philosopher Friedrich Nietzsche phrased it, is a spiritual achievement of the highest magnitude. “For God,” Diotima tells Socrates in Plato’s *Symposium*, “mingles not with man; but through a spirit [daimon] all the intercourse and converse of god with man, whether awake or asleep, is carried on. The wisdom which understands this is spiritual” (cited in Diamond 1996/2007, pp. 290–291).

Dalai Lama

Paul Larson

The Chicago School of Professional Psychology,
Chicago, IL, USA

The Dalai Lama is the most widely recognized Tibetan religious figure. Most Tibetans view him as the religious leader of Tibet, though his role as civil head of state has ended. The current one, born in 1935 as Tenzin Gyatso, is the fourteenth in the succession of tulkus, reincarnated lamas, to

hold his title. The name “Dalai” (Mongolian for “ocean”) was conferred in 1578 by Altan Khan, a Mongolian ruler who was seeking an alliance with Tibet. There had been two previous incarnations in the lineage, so the one so named (Sonam Gyatso) became known as the third Dalai Lama, and the two previous ones taking this title posthumously.

The young boy Tenzin Gyatso was recognized as the incarnation of this lineage in 1937, but as he was only 2 years old, a regent ruled in his place until 1950. Tibetans have viewed themselves as independent of China but have had a close political relationship with China for a long time as well. In 1950 the Communist government of the People's Republic of China asserted its claim over Tibet and enforced it with military occupation of the country. The Dalai Lama cooperated with the Chinese at first, visiting Mao Tse Tung in Beijing in 1954, but he fled to India in 1959 in the wake of an unsuccessful revolt and now resides in Dharamsala. He is considered to still be the leader of the Tibetan people in exile.

Spiritually, the Dalai Lama is considered an incarnation of the Bodhisattva Avalokiteshvara (Tib. Chenrezig), the embodiment of compassion. It is this quality that has marked his diplomatic efforts to both assert Tibet's claim of autonomy as well as find a realistic accommodation with the Chinese government. His efforts on behalf of his people as well as his leadership efforts toward interfaith communication resulted in his being awarded the Nobel Peace Prize in 1989. The current Dalai Lama has also become involved in dialog with some of the leading neuroscientists through their shared fascination with the nature of human consciousness.

Of all of his predecessors, the other one most widely studied in the West is the fifth Dalai Lama (1617–1682), known as the “Great Fifth.” He was the first to have significant civil authority over Tibet and constructed the Potala Palace in Lhasa, which was the seat of the Dalai Lama until 1959. Under his rule, the Gelug lineage prevailed as the leading one of four major lineages.

Dance and Religion

Jennifer Amlen

The Second Wind, New York, NY, USA

Dance generally refers to human movement either used as a form of expression or presented in a spiritual, social, or performance setting. Dance is also used to describe methods of nonverbal communication as forms of body language between humans or animals. Animals use dances such as the bee dance or mating dance. Movements convey specific information.

Dancing, combined with musical accompaniment, is one of the oldest rituals in religion, and circle dancing has been one of the most common ritualized dances throughout the history of time.

During the Egyptian Predynastic period (5500–3100 BCE), there were depictions of female figures, probably of Goddesses or Priestesses, dancing with their arms raised above their heads. The act of dancing was an important component of celebration and ritual in Ancient Egypt. Dance was much more than just an enjoyable pastime in Ancient Egypt.

The earliest known form of dancing was done in a line or chain referred to as chain dancing. The ritual of chain dancing is believed to have first appeared over 3,000 years ago, possibly in Ancient Greece. In Greek mythology the God Apollo was called the Dancer, the God of medicine, music, and poetry. In Sparta, a province of ancient Greece, it was the common law that parents were to teach their children to dance beginning at 5 years of age. The types of dance were also used in Israelite society. This included the circular or ring dance as well as the processional

dance. These dances were often used to celebrate specific events, such as David and the people of Israel dancing before the Ark of the Lord, which represented the presence of God.

It is written in Sanskrit that the Hindus believe that the whole Universe was brought into existence as the manifestation of Nataraja – the Supreme Dancer. In Hinduism, there are 23 celestial beings called Apsarases, who dance to please the gods and express the supreme truths in the magic of movement.

In the thirteenth century, Sufism was established by Rumi, the Persian poet. Sufism was a mythological offspring from the Muslim religion. “The Whirling Dervishes” believe in performing their dhikr in the form of a dance and music ceremony. The Mevlevi were a well-established Sufi Order in the Ottoman Empire, known for their dance which was performed as a form of worship. During the Ottoman period, the dance of Mevlevi Sufism spread into the Balkans, Syria, and Egypt. The Sufi dance and tradition is still being practiced in many countries.

Chain dancing was the original form of dance in pre-Christian Europe. During the early middle ages in Western Europe, Christian carols and hymns were sung and danced in “stanza.” The original meaning of “carol” is to dance. Carol is believed mean “dance circle,” and it is accompanied by singers. The definition of stanza is to halt or stop. The worshippers stood still in a circle with their attention to the center of what was being celebrated. From the 1150s to the 1350s, the carol was a popular dance and song performed throughout Europe. Priests danced with the parishioners during the early medieval period. The purpose of the dance was to allow the souls to get lost in the majestic rhythms. However, by the eleventh and twelfth centuries, the dance became controversial, and the hierarchy began to ban the dancing for the common people.

Over an 80-year period, from 1774 to the 1850s, the Shakers in America developed a repertoire of dances ranging from spontaneous shouting, falling, skipping, and turning dances. They danced in patterns of squares, lines, and circles, performed with precise and unison hand gestures.

In 1890 the Ghost Dance was a religious movement that was incorporated into numerous Native American belief systems. The traditional ritual in the Ghost Dance was also a circle dance, in which participants gathered without partners in a circle to dance to musical accompaniment.

Commentary

In 1916 Jung categorized dance/movement as a form of expression from the “active imagination.” Jung emphasized the importance of balance and harmony and attested that modern humans rely too heavily on science and logic. He suggested that it was more beneficial to integrate spirituality and incorporate the unconscious realm into one’s life. Jung incorporated a variety of approaches for the use of active imagination, and this technique has expanded to include nonverbal expressions, such as dance and movement. Jungian movement therapy addresses psychosomatic disorders concerning the body-mind interrelationship and the flow of energy. The use of the Jungian technique of active imagination through authentic in-depth movement is a gateway for the unconscious to communicate the process and direction of one’s therapy. Active imagination is neither dreaming nor guided fantasy; rather, its purpose is to build the bridge between the passive, receptive awareness of the inner unconscious material responding to the conscious in any form. Jung understood that “wholeness” resulted from establishing a working relationship between the conscious and the unconscious levels of the psyche.

The most common type of therapy today incorporating dance is called dance therapy.

In dance therapy the primary belief is that the body and mind are interrelated and the state of the body can affect the mental and emotional well-being both positively and negatively. Dance therapy explores the nature of all movements. Dance therapists have been able to diagnose and help solve various psychological and somatic problems through observing and altering the

kinesthetic movements of a client. Gestures such as standing still, sitting down, or moving one’s hands in protest are considered an expression of movement in dance therapy. There are several different forms used in dance therapy, including encouraging and observing one’s authentic movement in individual or group sessions. There are often various forms or gestures suggested by the therapist.

Marian Chace, who was a modern dancer in the 1930s, officially developed dance therapy. She decided to stop her professional dancing career and teach dance instead. In her classes, she noticed that some of her students were more interested in the emotions they expressed while dancing (fear, loneliness, anger, etc.) than in the mechanics of the moves they made. She began encouraging them to express themselves by emphasizing more freedom of movement rather than technique. By the 1940s, she started the profession of dance therapy.

In the 1960s Mary Whitehouse developed an approach to dance therapy by combining the use of active imagination and analysis. The purpose was to acknowledge all the material that emerged from unconscious levels and to then carefully move the patient towards greater balance, health, and creativity. In ego psychology, the “observing ego” is needed only to maintain a coherent sense of self, so that one is not overcome by overwhelming uncontrollable emotions from the unconscious. It exercises a selective function, choosing what it wants to attend to and deciding when and in what way to act. Thus, the conscious and unconscious levels of the psyche enter an ongoing dynamic relationship with each other, in which both are essential. Gestalt therapy and bioenergetics also incorporate movement and physical expression of the nonverbal content. Lowenian Bioenergetics is a type of therapy that combines working with the body and mind to move beyond emotional blocks and is based on energy flows. In Fritz Perls Gestalt Therapy, one strives to become more whole and creatively alive, to be free from the blocks and unresolved issues that diminish fulfillment and growth. Both these types of

therapy incorporate the body, mind, and energy that one is experiencing in the present moment, just as any form of rigorous dance does.

Dark Mother

Kathryn Madden

National Institute for the Psychotherapies,
New York, NY, USA

The primordial Dark Mother and her values of transformation have existed in the human psyche since ancient times. Her image is specifically apparent in the Black Madonna, Mary Magdalene, Hecate, Demeter, and numerous other female divinities of the earth.

The Dark Mother, as a figure of mythology, is created at the collective archetypal layer of the psyche. Her image appears in all cultures: African, Hindu, Christian, Egyptian, Greek, Roman, and countless other cultural and religious sources. In 15,000 BCE, Africans sketched fifteen figures of the Dark Mother in red ochre on the walls of the *Grotto dei Genovesi* in the Egadi Islands south of Palermo, Italy. The images existed fifteen millennia before the Common Era (Birnbbaum 1993, pp. 26–28).

Black Mother: Ibla Nera

The characteristics of *Ibla nera* or black Ibla, a contraction of the name of the Anatolian (ultimately African) goddess Cybele brought to Sicily by traders from west Asia, were transferred, in the Christian epoch to the Black Madonna. These images are speculated to have been found in this cave dwelling 100,000 years ago when *Homo sapiens* migrated out of Africa. Archaeologist Marija Gimbutas gathered the evidence of the civilization of the goddess in Old Europe (Gimbutas 1982, 1989, 1991).

Figures of the Dark Mother found in France, Italy, Switzerland, Austria, Germany, and Eastern Europe, dated 25,000 BCE, were located along paths of Paleolithic migrations out of Africa and are located near post-Christian sanctuaries of Black Madonnas (Cavalli-Sforza 1994; Cavalli-

Sforza and Cavalli-Sforza 1995). The origin of her veneration can be traced to the Sinai where Africans created the oldest religious sanctuary in the world in 40,000 BCE at Har Karkom, later called Mount Sinai (Birnbau 2001). Sanctuaries of *Ibla nera* have been found in Sicily as well as in the later rituals of sibyls and priests of the Dark Mother who reflect the impact of violent Indo-European invasions (Gimbutas 1991, Chap. 10).

Archaeological artifacts and sanctuaries of the Dark Mother found in Italy, Spain, France, Switzerland, Germany, Czechoslovakia, Poland, and Russia were evidence of cultures of women, peasants, and others who were negated by the dominant patriarchy as “dark.” Historically, these cultural regions retain evidence of religious heresy and were sites of uprisings for justice and equality in which women were persecuted as witches. The cultural folk wisdom about justice found its roots in the collectively inherited ethic of justice in the African culture of Isis who was venerated throughout the known world in the first centuries of the Common Era.

During the time of the Spanish Inquisition and Counter Reformation (fifteenth–eighteenth centuries), power was consolidated by persecuting “dark” others: Jews, Moors, heretics, and women. Catholic and Protestant clergy continued to identify certain women with the devil. The *Malleus Maleficarum*, the handbook of the Inquisition, was used as a reference to put women to the stake who differed from the *status quo* of the church, civil law, and societal custom.

Compensatory Rituals

In an atmosphere that persecuted and repressed the earthy, fecund, and sexual nature of women, various rituals and festivals arose to compensate for the one-sidedness of the dominant culture. The values of the Dark Mother – justice and equality – were kept alive by godmothers whose rituals resisted patriarchy. Celebratory experiences such as *Carnavale* evoked spontaneous eruptions from the unconscious of the common peoples, enabling European peasants overtly to express feelings of defiance toward the church and state.

During the fifteenth–eighteenth centuries, the church persisted in associating the color white with purity and the color black with evil and the devil. In contrast, the rituals of the common people interpreted the color black as good (Guastella 1887, p. 68ff). In most Old European traditions, black was associated with fertility and the womb of life (Gimbutas 1989, pp. xix–xx, 198). Dreams, the messages of the unconscious, so threatening to the church and doctrinal codification, were believed to reveal divine messages. In dreams that came to the fore during *Carnavale*, a black egg signified fecundity; a dream of a white egg represented loss, sadness, and tears. In general, the color black in dreams was considered a good omen.

Numerous rituals continued throughout the early centuries representing memories, feelings, and images held deep in the unconscious heart of the culture. Regular pilgrimages were made to the Dark Mother, most typically represented by the Black Madonna. During these pilgrimages, the participants wore masks. A group of women covered with black silk capes, their faces hidden except for one eye, would sing and dance while carrying torches, representing the act of Demeter searching for her daughter. As the journey toward the edge of town continued, revelry ensued that lasted throughout the night. The procession of pilgrims would reach the statue of the Dark Madonna at dawn. There, they would behold an image of the Great Mother Cybele which was sculpted into the mountain (Guastella 1887, p. 125).

Psychological Aspects

The chthonic aspects of the Dark Mother and the other feminine figures can be explored psychologically and symbolically from the perspective of the archetype of the Great Mother as described by twentieth-century Jungian analysts Carl Jung and Erich Neumann. Drawing from primordial and collective origins, the dark and the chthonic – chthonic pertaining to dark, primitive, mysterious, and primal instincts that come to us directly through nature – balance the viewpoint of

human consciousness that respects only the light and spiritual aspects of an archetype.

As an archetype, the Dark Mother represents life, death, earth and sexuality, and deep transformational energy. She has been associated with nurturing, birthing, and caring for children, the sick, the elderly, and the dying. The Dark Mother is often represented in myth as the Queen of the Underworld or one who travels to the Underworld. The Underworld does not necessarily represent hell but more as a place where souls reside between lives, thus, a space or interval of liminality.

One figure who is typically associated only with the light and spiritual aspects of the archetype is Mary the mother of Jesus. Mary, however, is a paradox. If her unconscious values are truly explored, she creates a powerful dynamic by incorporating body as well as spirit, power and vulnerability, the value of death, as well as life and rebirth.

The official presentation of Mary has been as an object of veneration emphasizing qualities of an over-spiritualized, submissive model of a woman ignoring the normal desires and aspirations of flesh-and-blood women. Throughout the centuries, the sketchiness of Mary's scriptural features has been filled in with cultural content that has emphasized such opposite qualities as stature and humility, courtly elegance in contrast to her solidarity with the poor. Yet, as a historical and symbolic figure, her maternity is central.

Jung called Pius XII's proclamation of the dogma of the Assumption on 1 November 1950 "the most important religious development for 400 years" (Jung 1973, p. 567). The importance of the proclamation was that it gave expression to what he called "a spiritual fact which can be formulated as integration of the female principle into the Christian conception of the Godhead" (Jung 1973, p. 8). The proclamation represented official ecclesial sanction for an idea that had been rooted in popular piety, as witnessed in the veneration of the Dark Mother, for many centuries. The Assumption signified the living archetype forcing its way into consciousness. Jung concluded that "the symbol in the Catholic Church is alive and is nourished by the popular psyche and actually

urged on by it. But in Protestantism it is dead" (Jung 1976, p. 8).

Jung earlier had criticized the one-sided masculinity of the Trinity and had suggested that the psychic approach to the Christian godhead might be conceptualized more appropriately by a quaternity, with Mary as the fourth "person." He believed that the two Marian dogmas (the Immaculate Conception, proclaimed by Pius IX in 1854, as well as the Assumption) confirmed Mary's status and function as incorporating a feminine element in the human understanding of the nature of God.

Jung's enthusiasm for the Marian doctrines has been received reluctantly on two principle fronts: church officials, both Protestants – many of whom regard Marian devotion as close to idolatry – and Catholics, who deny the proclamations about Mary's divinity and insist that worship, as opposed to veneration, must be reserved for the triune God alone.

Analytical psychologist Mary Daly maintains that the Mary symbol has been a two-edged sword. The symbol has a power that "the most oppressive of the Christian churches has captured and used. . . tamed and domesticated [through] the plaster statues, the saccharine prayers, sermons, poems and hymns and the sexist theology that has explained it" (Daly 1973, p. 83).

While a study of variations of the Great Mother throughout history reveals that images of Mary are clearly adaptations or reworkings of earlier mythic figures such as Ishtar, Astarte, Isis, Cybele (c.f. Harding 1955, p. 99), Daly argues that Mary is not only connected to the ancient collective past but is also a prophetic figure. Mary conveys female autonomy and also an integrated relatedness. Daly credits Jung with recognizing the corrective of the dogma of the Assumption. Jung succeeded in "raising" matter and unconscious evil – so often attributed throughout history to woman or "dark otherness" as material or earthly – to divine status. Jung thereby contributed toward healing dangerous splitting and projective activity, although we still are witness to such projections in many contemporary cultural arenas.

The figure of Mary, in her symbolic potential to heal the gap between personal and impersonal in a

feminine approach to the divine, “recover[s] to full consciousness...the tangible reality of women’s experiences and the symbolic reality of the feminine” (Harding 1955, p. 124). She does so by making us conscious of the qualities and attributes of the Great Mother as also having also a “Dark” or elemental, earthly nature that has not been acknowledged in official theology and only partly recognized in popular piety.

Archetypal Aspects of the Positive and Negative Great Mother

Jung and his student Erich Neumann expand upon the paradoxical elements embodied by the figure of the Great Mother. Archetypes are aspects of the collective unconscious, a vast transpersonal realm which remains hidden from direct observation but may be inferred or hypothesized through psychic ideas or images as they are expressed in dreams, fantasies, delusions, myths, stories, and symbols. Archetypes have an innate propensity to order experience along certain patterns.

One crucial archetype that can be inferred from behaviors and ideas that emerge and develop from birth onward (or perhaps before) is that of the mother. The mother archetype generates and releases certain patterns and perceptions from the child’s unconscious so that the child develops behaviors, feelings, and activities that form a “mother” pattern within the child’s experience of reality. These images can be positive or negative depending upon how the child is mothered in reality and upon his/her cultural and social context.

Gradually the child’s experience of a personal mother is augmented, refined, and fleshed out by other aspects of mothering by grandmothers, godmothers, nannies, social institutions and ideas such as “mother country,” and cultural constructs such as myths, fairy tales, and religions. Jung calls this intricate interlacing of feelings and experiences the “mother complex” (Jung 1969, para. 156–198). Although the contents of the mother complex are supplied by the child’s experience of self and other, these contents are activated and shaped by the generative, numinous archetypal core at the unconscious center of the complex.

In *The Great Mother*, Neumann analyzes the “symbolic polyvalence” of the mother archetype. Extracting from the wealth of images, symbols, beliefs, and rituals that cluster around the Great Mother, he is able to formulate the structure of this archetype.

Neumann explains two feminine “characters”: elementary and transformative, each of which has two aspects, positive or negative. He sets up two sets of antinomies: fixed versus fluid and light versus dark, illustrating the various characteristics and activities of the Great Mother as ranging along a series of concentric circles built around these axes (Neumann 1963, p. 82). The elementary character is at the core, and the successive stages of transformation radiate outward from it to the farthest circle from the center, which represents extreme spiritual fluidity. Yet, within each stage or circle, there is a degree of coloration, shading from light to dark that represents the positive/negative range.

By means of his conceptualization, on the “positive” side, the elementary maternal character of fixity can represent nurture, containment, safety, and peace. On the “negative” side, fixity becomes entrapment, devouring, and death. Analogous to developmental maturation and spiritual growth, these opposites can become fluid and transformative. The transformative maternal character can range from the highly evolved spiritual ideals such as wisdom and immortality. An untransformed, undeveloped maternal character results in an experience of entrapment, dissolution, diminution, even madness, and death.

Neumann uses the figure of the Virgin Mary as virgin and mother to depict “high” and “light” in his diagram. Along with such figures as Demeter and Sophia, Mary the God-bearer inhabits the realm of good nurturing and spiritual wisdom. These are the aspects that have been presented by the official church and that have inspired much about her that is virtuous, moral, and noble.

Yet, an excess of only sweetness and goodness can produce a conscious imbalance, an overly idealized image. In a religious symbol, such one-sidedness can lead to psychological lifelessness. As Jung noted in his introduction to *Women’s Mysteries*, an archetype only presents itself in a

numinous way if it is clothed in symbolic language, in adequate symbols.

The Great Mother that is transformative – elementary, negative as well as positive – gives us an integrative whole that is timeless and numinous. We need the personal and archetypal elements of the mother archetype, inclusive of the qualities of the Dark Mother, to become conscious in us. Any archetypal symbol of transformative significance incorporates body as well as spirit, power as well as submissiveness, and death as well as life.

Dark Night of the Soul

Kathryn Madden

National Institute for the Psychotherapies,
New York, NY, USA

John of the Cross was a Spanish poet, Roman Catholic mystic, and a Carmelite priest in the sixteenth century who said “you cannot find the light unless you enter the darkness.” As a founder of the Discalced Carmelites of the Catholic Church and a friend of Saint Teresa of Avila who became his spiritual director, John attempted reforms of the church for which he antagonized the religious and political hierarchy and was imprisoned in 1577. In his prison cell he wrote the *Spiritual Canticle* and began *Songs of the Soul*. After escaping from prison in 1578, he went to Andalusia, where he wrote prose on mystical theology, notably *Ascent of Mount Carmel* and *The Dark Night of the Soul*.

The Contemplative “Dark Night”

John spoke of the *Dark Night of the Soul* as a period of passive purgation that the soul undergoes once having transitioned from active to contemplative spirituality. The dark night is a purging purification before one is brought into the full ecstasy of mystical union with God. John described this purgation as drawing one’s spirit away from its ordinary sense of things so that it can become completely aware of its divine senses. Although it is difficult conceptually to describe mystical experience with God, the phrase “dark night” can be understood as a metaphor for John’s spiritual journey. His “soul’s flight” entailed an

experience of the privation of light as the necessary deprivation of everything that comes between a human being and the perfect love of God.

John defines this experience specifically in *Dark Night of the Soul*:

This dark night is an inflowing of God into the soul, which purges it from its ignorances and imperfections, habitual natural and spiritual, and which is called by contemplatives infused contemplation, or mystical theology. . . . Inasmuch as it the loving wisdom of God, God produces striking effects in the soul for, by purging and illuminating it, God prepares the soul for the union of love with God's being. (St. John of the Cross 1959, Bk. II, ch. 5)

In the Dark Night of the Soul, the soulful essence of the individual experiences suffering and there is intense longing for God. If an individual has relied upon a prayer life, the reliability and consistency of traditional prayer suddenly becomes labored and unrewarding. The person experiences isolation and abandonment by God. This period of acute desolation, which is a transitory state, feels “dark,” frightening, and even life threatening.

Other descriptions of the dark night refer to at one extreme as holy and at the other extreme as spiritual madness, spiritual emergency, or spiritual crisis. Any of these terms can equally relate to the unique experience in which, from a religious perspective, the soul encounters an ultimate test of faith, endurance, purification, and surrender on the path to finding God. Those who have passed through this “night” express a sense of spiritual emergence and freedom.

In contrast to being a negative event, the dark night of the soul is thought by those whose practice contemplative prayer to be a stage of growth in which an individual achieves a deeper level of contemplation: growth from verbal prayer to mental prayer.

One experiences a closer relationship to the divine. Although the wait makes one feel extremely vulnerable, fearful, and temporarily out of control, in the end, the former self with its old assumptions dies. For some, the dark night is a long, slow, painful, and repetitive process. For

others, the dark night is intense and rapid. The length of time most likely relies upon the individual psyche and what needs to be examined and surrendered to God toward change.

Psychological Analogues

Psychologically speaking, the dark night is a profound experience that strips away our false self and brings to awareness deeply buried traumas or developmental failures that can be integrated toward individuation: a mature sense of wholeness. Regardless of whether we consider the dark night to be a religious or psychological experience, or both, if the person is able to endure it, his or her life will be extremely changed toward a newly centered consciousness, in psychological terms toward a realignment of the ego with the self, the central archetype of order.

In the development of the ego-self alignment, the ego will no longer be the center of its own universe but will be dedicated toward this new center of being with a confidence that something larger is working within the individual toward accomplishing things for the greater good. As this new center emerges, the temporary state of “spiritual madness” fades. Gratitude and joy abound.

We surpass the “depressive position” of psychoanalytic thought and live from a more truly authentic self. Purged of false projections and unfounded beliefs about ourselves and others, our life path becomes guided by a series of synchronous events: simultaneous occurrences with no discernible casual connection. These synchronous occasions give us a new sense of freedom. The limited view of the ego is no longer the sole guide of our destiny. Our real mission in life begins to unfold. Spiraling ever deeper into a dimensional labyrinth inclusive of psyche, soul, body, and spirit, our consciousness expands to include greater intimacy with that which is transcendent and eternal.

Because of the abyssal emptiness and feelings of desolation of the dark night of the soul, it has been compared to the psychological manifestation of madness or depression: what Carl Jung called

“the night sea journey.” Still others believe that the dark night leads us into the most intimate sanctum of the soul, to that primeval preexistent “gulf” that was the soul before it became incarnate on earth.

Regardless of perspective, what we do know is that the dark night of the soul is a painful and lonely process during which our consciousness is clouded with uncertainty. The entanglements of the ego seem, however, to have some purpose in their unraveling: unveiling a new center. The process in which this disentanglement occurs can appear, psychologically speaking, as a form of depression. Yet, this depression is purposeful in that the psyche is striving toward the goal of soul retrieval. From this perspective, perhaps there are spiritual aspects of depression.

Soul Retrieval

As a play on the well-known phrase of John of the Cross – *Dark Night of the Soul* – is it possible that occurrences of depression, at least some forms of it, are a necessary first phase in the retrieval of soul? Are there instances in which soul that has become lost, isolated, and devoid of meaning in our modern, stressful world purposefully succumbs to forms of depression that are necessary for greater wholeness?

From an analytical perspective, depression is not always perceived as a disease in need of fixing. Depression is a matter of coming home to the soul. It is not an illness to be cured. It is the cure.

Carl Jung claims that, along with a withdrawal of libido from *consciousness*, what occurs is “an accumulation of value – for example, libido – in the *unconscious*” (Jung 1966, para. 344). An example of this would be a person whose conscious world “has become cold, empty, and grey; but [whose] unconscious has become activated, powerful, and rich” (Jung 1966, para. 345).

Analyst Esther Harding (1970) expands upon this, explaining that one hallmark of depression is that “all energy disappears into the unconscious.” Depression, whatever its degree, “depends on a withdrawal of libido into the unconscious” (p. 1). Harding makes an even more provocative

observation by claiming that “the withdrawal of energy or libido from the person’s conscious world comes about because some unconscious content, some unknown element has risen up into consciousness and has exerted an attraction upon it” (Harding 1970, p. 3). In other words, there are certain aspects of depression that are being driven by the force of the central regulating factors of our psyche. Something unconscious is striving to be integrated. Harding calls this purposeful activity on the part of the psyche a “creative depression.”

Dark Night: Creative Depression

From a Jungian orientation, the notion of creative depression is outlined by John Weir Perry, an analyst known for his work on spiritual emergencies. Perry summarizes the process of working through the dark night of a creative depression. He uses the term “acute episode” to describe the stages of creative depression (Perry 1999, pp. 63–64):

1. A reordering or reorganization of the ego, in which we mostly deal with the alienated parts of our ego, a crisis in growth and development
2. A charged feeling of death and rebirth

The reference here is to a symbolic death and rebirth not about actual death.

During an acute episode, the feeling is of great ambivalence, doubt, feelings of alienation, depression, and recurring dreams. These symptoms are signs that the unconscious is trying to get our attention.

Jung would say that this activity is being directed by the central core of the psyche, which he calls the self. According to Jung, “The archetype of the Self is the primary ‘ordering force in the unconscious.’” It is the archetype of the center which evokes primordial images similar to the universal motifs of religions and myths. These images are emotionally powerful, and they most often appear in our dreams and fantasies. Like all the archetypes, the self is part of the deepest layer of our unconscious the layer which Jung calls

“collective” or “objective.” Although we experience the self as existing within our subjectivity, it is not our property. The self possesses its own independent life.

1. A third aspect of the acute episode is the feeling of regression. Regression serves to bring something unconscious into our conscious awareness.
2. Forth, the transcendent function is a crucial factor in the acute episode.

We can identify the workings of the transcendent function when we experience intensified conflicting polarities or opposites within ourselves. We find ourselves wrestling with feelings and images that are at great odds. The human psyche works through this function toward a synthesizing resolution in which the two opposites are resolved into a “uniting third.” The uniting third brings new growth to the personality.

1. Fifth, in an acute episode there is an abundance of imagery which is powerful and numinous. Numinous pertains to images that are wholly other. These images tend to break in and shatter our typically one-sided conscious perspective. Numinous imagery often has to do with an aspect of the god-image.

When an acute episode occurs, the first images to emerge are usually persecutory or fearful images such as thieves, devils, inner saboteurs, ferocious animals, or reptilian images. These images feel as if they are trying to destroy anything positive or life giving.

1. Sixth, eventually the person settles down into a state of coherency and clarity with a new vision and identity. The ego’s experience of dying finally gives way to the idea of being born or giving birth. This birth “is the fundamental ground of the whole experience” (Perry and O’Callaghan 1992, p. 4).

For instance, a patient in treatment might suddenly become terribly agitated, restless, distraught, confused, and tearful, as if wrestling with his or her fears in an internal dialog that is

difficult to externalize. If the person is a religious person, he or she might pray for hours, finally regressing and curling up into a ball, alone, worn down with tears. Guilt, shame, and depersonalization may come to the fore. The persecutory part of the psyche begins to drown the ego in a spiraling vortex of self-blame.

The person increasingly withdraws inward, feeling traumatized and abandoned by figures whom he or she had trusted. In the middle of these feelings, the person finds herself or himself in the throes of an acute episode. Initially, it may feel like an overt panic attack or a nervous breakdown. The ego, as the central aspect of conscious identity, may be convinced that it is dying.

Some people have described the initial symptoms as if they are crumbling apart, cracking out of their skin, finding it difficult to breathe. The walls of the ego’s defenses are disintegrating. As the contemplatives have demonstrated, prayer, journaling, or any form of writing or expression helps to give an outlet for these strong feelings.

It is strenuous for the ego when the self intentionally draws psychic energy back into the unconscious, but this is necessary so that the otherness of the transcendent function can function. As the transcendent function begins to function, points of view arise in the person’s dreams and waking fantasies that are contrary to whatever position their ego holds. It is as if two voices are in dialog, each with contrasting points of view.

Conflictual Opposites

Great inner conflicts can arise around moral stance. The opposites within can polarize to an extreme: hedonism versus morals, one political stance over another. Moral confusion, especially in medieval times, was equated with the devil and possession. The internal voices thrash back and forth, each justifying an opposing position. The disparate voices thrash back and forth.

What becomes apparent in an acute episode is that what the values we have been so assured of have been primarily according to the ego’s point of view. Tremendous indecision ensues. The ego flounders. In its confusion can become identified with both sides of the opposites.

On the one hand, we regress back into the world of the biological parents and struggle with unresolved developmental issues. On the other, we are dealing with the primordial and symbolic parents of the archetypal realm. This clash of forces can feel as if we are in an ideological, spiritual, or cultural battle with the entire collective consciousness, as John of the Cross felt he was in the time of reformation.

Keeping up the dialog – inner or outer – is important because the opposites must be separated first before they can begin to integrate. Both positions of conflict need to become conscious. This tension of opposites makes room for the transcendent function. Each position is given freedom of expression to justify itself without consciously forcing a resolution.

As the preliminary thrashing of opposites subsides, the contrary positions begin to settle. The person may undergo an intense period of melancholy with apparently no relief. Yet eventually spirit breaks through. As one patient described:

a lantern of intense light rose up behind my eyes. It illuminated my thoughts. I suddenly had access to deep insights. This light was so positive and good. Images flashed before me of sexual activity that I had identified with the devil. I fell into sorrow over the object of my lost-love – my once idealized biological father. Then an image of Christ came to me. I was filled with certainty! Christ: a reality! I started reading the Bible even though I had not been to church in seventeen years. Certain words lifted off the page and were three-dimensional. Bliss! I slept easily feeling safe and contained.

In this brief clinical example, we can see how an acute episode of a creative depression can bear the potential of soul retrieval in which the symbolic death that a person undergoes is something like gazing into a dark night. Yet, as Jung discovered among the Latin writings of Desiderius Erasmus: *Vocatus atque non vocatus, Deus aderit*. Bidden or unbidden, God is present.

Daseinsanalysis

Todd DuBose

The Chicago School of Professional Psychology,
Chicago, IL, USA

Daseinsanalysis, the German word for “Existential Analysis,” is based on the phenomenological anthropology of Martin Heidegger (1889–1976), and the subsequent development of his thought for clinical endeavors in the 1940s by two Swiss psychiatrists, first, Ludwig Binswanger (1881–1966) and then Medard Boss (1903–1990). Differentiating from both psychoanalysis and other styles of existential therapy, Daseinsanalysis is distinctive in its analysis of *Dasein*, or quality of “being there” in the world.

Martin Heidegger proposed that human existence has an ontological, or general and foundational, structure that is expressed in “ontic,” or concrete, ways of living out unique comportments in the world (Heidegger 1962). Yet, Heidegger argued that understanding these concrete and specific ways of living in the world requires a prior awareness of how these unique ways of being-in-the-world relate to the broader understanding of human existence as an ontological whole. Heidegger distinguished between an analysis of *Dasein* and Daseinsanalysis as a clinical practice, seeing the former as a philosophical anthropology on which the latter is based. Daseinsanalysis addresses particular ways each human being moves in the world in the light of the larger ontological structure of human existence.

Heidegger wanted to leave the word, “*Dasein*,” untranslated in order to avoid the inaccurate equation of “*Dasein*” with concepts such as “person,” “ego,” or “self.” *Dasein* is not a “thing” or a fixed and encapsulated entity, but a phenomenological process in which cleared space and the lightening of existential constriction and burden allow for the possibility of phenomena to “show themselves.” *Dasein*, both concealed and revealed, discloses itself through existential givens, which are inherent conditions all human beings live out in our everyday existence. They are, specifically, temporality, spatiality, coexistence, mood or attunement, historicity, bodyhood, and mortality. Moreover, *Dasein* discloses itself within the equiprimordiality of human existence. By saying that human existence is equiprimordial, we mean that we all simultaneously live our lives within three modes of being: the *Umwelt*, *Mitwelt*, and *Eigenwelt* (Boss 1979; Heidegger 1962; May et al. 1958).

The *Umwelt* is our biological and environmental existence. Our *Mitwelt* is our “with-world,” or relational world, which entails the quality of “being-with” in our relationships (i.e., close, distant, and conflictual). Our *Eigenwelt* is our lived experience, which is the unique ways we experience ourselves living through situations. No one mode of existence dominates and takes priority over any of the other two. No one mode of existence can be extracted from the other two. Pain,

stress, and hypertension are examples of how the three modes of existence mutually shape and are shaped by the other two. Our integrated, equiprimordial comportment through our everydayness always and already finds itself within the integrated existential givens in the world. The world is not a place to locate persons and things, but a web of meaning and backdrop against which aspects of our lives come to make sense to us and come to disclose themselves to us.

Through embracing inherent limitations in each moment, that is, our finitude, facticity, and contingency in existence, which Heidegger called our “thrownness,” we can more authentically live out our “ownmost” possibilities in the world. Relinquishing this call towards our ownmost possibilities, and instead, succumbing to being defined by culture, the status quo, or just allowing life to carry one along and define us without claiming one’s own life as one’s own is a life of inauthenticity. Existence, in its ontic sense, is a perpetual movement between authenticity and inauthenticity, as well as between freedom and finitude. Meaningful experiences in life are those that occur within the embrace of one’s limitations in the search for immanent possibilities.

Binswanger, Boss, and other Daseinsanalysts align with psychoanalysis around the value of a human existence coming to know itself through the movement from concealment to disclosure, but differ significantly from psychoanalysis regarding its more mechanistic understanding of mental processes (Binswanger 1967; Boss 1963, 1977, 1979). As such, key constructs of the psychoanalytic project, such as the psyche, unconscious, transference, and projection, are jettisoned outright, or, at least significantly, altered in their meaning. Furthermore, Boss believed the therapeutic question guiding clinicians should not be the psychoanalytic persistence on a determinative past as expressed in the word, “why?,” but, instead, should be the more hopeful, future oriented, and more inviting question, “why not?” Our future impacts us as much as our past, as Daseinsanalysts see it, and both our lived future and lived past disclose themselves in the present, or, here and now, comportment in the world. Boss and other commentators of Boss’ work have

argued, then, that Daseinsanalysis is “purified” psychoanalysis, having rid itself of unnecessary metapsychology and engineering conceptualizations of mind that are not phenomenologically experienced anyway (Stadlen 2005, 2007).

In relation to other existentially oriented therapies, Daseinsanalysis also differentiates itself by insisting on the “thrown” nature of our world situations. We are never *absolutely* free, as some more humanistically bend existentialists may argue, but lean into our possibilities within *situated* freedom. Likewise, Daseinsanalysis does not see the person as an ego, psyche, or any kind of “thing-hood,” but sees the person as inextricably interwoven in the world. The person is how one moves in the world. What is seen in the world is not a static “it,” but a process of being, a comportment through situations. The relationship of Dasein and the world is co-constructive, as the world is disclosed as it is only in light of the presencing of Dasein being “all there.”

Commentary

Spirituality is an inherent aspect of Daseinsanalysis and is understood as transcendence within and through immanence (Driver 1985). One’s experience of transcendence, understood as the experience of unfolding and living through one’s ownmost possibilities, is enframed by embracing one’s being-unto-death or embracing one’s situational and ontological limitations, including, of course, but not exclusively, the end of our biological existence. One’s “throwness,” though, is an everyday and every moment phenomenon. Several theorists have tried to compare Heidegger’s work to other religious traditions, such as Taoism, Christianity, Buddhism, Hinduism, and Judaism, which is evidence to the universality Heidegger’s work could offer to such diverse life worlds, as the impulse to comparisons is predicated on qualities that may easily be deemed “spiritual,” in the existential way, that are embedded within both the ontological and ontic expressions of *Dasein-in-the-world*.

The very ontological structure of *Dasein* is what Heidegger called “solicitude,” or care. This

is not primarily a feeling of empathy, but an inherent intending and enacting of significance. Each moment of experience intends and responds to his or her world’s call to significance. We are always and already attuned, intending, called by, and responding to meaningful encounters in the world. I call this approach “pastoral” in that its focus is on clearing space and lightening burdens such that disclosures of possibility can show themselves. It is “pastoral” in its alignment with one’s own most possibilities within the tragic dimension of life’s “thrones,” or finitude. This approach is very incarnate and finds transcendence by courageously enacting one’s own most possibilities while embracing one’s death amidst the tragic dimension of life.

Daseinsanalysis values meditative releasement, as Heidegger’s calls it, or letting go while exploring phenomena, rather than a habit of calculative manipulation and control of situations and persons. Letting go shows itself in uncovering, clearing, unburdening, disclosing, and releasing phenomena to show themselves as manifestations of *Dasein’s* being there, and never being-elsewhere-beyond existence. In other words, transcendence does not occur outside of existence, for the Daseinsanalyst, but within it. Transcendence, however, is the heart of Daseinsanalysis, where the therapeutic questions and goals are on freedom towards how one would like to be in the world and what seems to be constricting their freedom to be so. Hence, rather than fall short of a true integration of psychology and religion through incomplete comparisons and contrasts, or juxtapositioning of one against the other, Daseinsanalysis provides us with the possibility of a discourse and language that could provide a true integration of our present-day separatism, if one agrees that transcendence is found in and through immanence. In the clearing of space and the lightening of burdens, modes of being-in-the-world are uncovered and truths of existence show themselves in ontic particularities. What is also interesting to consider is how Daseinsanalysis can provide a foundation for multicultural considerations, given that we all live through equiprimordial and existential givens in the world simply by being human beings, but take

up those experiences in very unique ways. We then could celebrate a true communion of diversity.

Daseinsanalysis is practiced around the world and is centralized in the International Federation of Daseinsanalysis, including countries such as Brazil, Greece, Belgium, France, Hungary, Austria, Canada, England, the Czech Republic, and, of course, Switzerland. Originally having its training headquarters in Zurich, which was originally limited to medically trained psychiatrists, the apparent exclusivism sparked points of contention among some Daseinsanalysts (Stadlen 2005, 2007). Today, though, Daseinsanalysis is growing in appreciation in the United States and is taught in the human science-oriented doctoral programs in psychology. As it continues to spread in awareness and appreciation, more and more clearings will provide space for freeing us all to live more into our ownmost possibilities.

Of all the personalities in the Hebrew Bible, David might be the most human. Very spiritual, musically gifted, and poetic, David is also a man of the flesh. He can be intensely political, coarse at times, and certainly not immune to sexual desires and appetite. David is not one-sided. He is a “man of the field” as is Esau but also a “quiet man,” as is Jacob (Gen 25:27). It is the blend between David’s spiritual and physical that makes him so endlessly fascinating and so prototypical of the Jewish emphasis on the integration of body and soul, unlike what Robert Alter (1999, pp. 110–111, Footnote 55) suggests is the Greek approach to writing history. Although much has been written

about David, both positive and negative (e.g., Sternberg 1985; Halpern 2001), it is the humanness deriving from the blend of spiritual and physical on which we shall focus.

We first encounter David in I Samuel 16:12 after God announces to Samuel that because “he (Saul) has turned back from me. . . I repent that I made Saul king” (I Sam 15:10–11). As Chap. 15 ends, Samuel has told Saul that “The LORD has torn away the kingship of Israel from you this day and given it to your fellow, who is better than you” (I Sam 15:28). The chapter concludes with: “Samuel saw Saul no more till his dying day” (I Sam 15:35).

In Samuel 16, God instructs Samuel to find and anoint a replacement for Saul whom God will indicate (I Sam 16:1–3). Upon arriving in Bethlehem, Samuel asks Jesse to call each of his seven sons to pass in front of him (Samuel). None is suitable. Samuel bids Jesse to call his youngest son, David, who is tending sheep (I Sam 16:9–12).

When David arrives, he is described as “ruddy with fine eyes, and goodly to look on.” Yet God has previously instructed Samuel not to be overly concerned with physical appearance at the expense of underlying spirituality: “Look not to his appearance and to his lofty stature. . . For not as man sees does God see. For man sees with the eyes and the LORD sees with the heart” (I Sam 16: 6–7). David is clearly God’s choice (I Sam 16: 6–7). From this day on, David is described as “gripped with the spirit of the Lord” (I Sam 16:13). From his first appearance, then, the interchange between David’s physical and spiritual nature is emphasized. Saul becomes depressed as a result of God’s abandonment of him and asks his servants bring to him a man skilled in playing the lyre. The musical David is brought to him, and the way he is described illustrates our theme. “Look, I have seen a son of Jesse the Bethlehemite, skilled in playing, a valiant fellow, a warrior, prudent in speech, a good-looking man, and the LORD is with him” (I Sam 16: 18–19).

In Chap. 17, the spiritual lyre-playing David volunteers to answer the challenge to battle issued by the giant Philistine warrior Goliath. (I Sam 17: 8–11) Saul at first refuses David’s request,

responding that David is just a lad (whom he knows as his lyre player). David persists, describing how he has already slain a lion and a bear who threatened his flock. He says specifically to Saul, “The LORD who has rescued me from the lion and the bear will rescue me from the hand of this Philistine” (I Sam 17: 31–37).

David goes to face Goliath with his sling and a simple shepherd’s pouch. He strikes Goliath in the forehead with a stone from his sling, slaying him. Yet, central to this narrative is that David has not felt that it is his physical agility alone that leads to Goliath’s defeat, but his relationship with the God of Israel. Before he has run at Goliath, David said to him: “And all this assembly shall know that not by sword and by spear does the LORD deliver, for the LORD’s is the battle and he shall give you into our hand” (I Sam 17: 38–54).

David’s behavior is totally unlike that of the more egocentric Greek warrior Ajax, Goliath-like himself, who has angered the goddess Athena by not giving credit to the gods for his military victories: “Father, with heaven’s help a mere man of nought might win victory, but I, albeit without their aid, trust to achieve a victor’s glory” (Sophocles 1938, lines 759–77). She makes him temporarily mad, deflecting his rage against Odysseus and his men to a herd of sheep. When Ajax realizes how madly he has acted, he falls on his sword (Sophocles 1938, lines 815–866).

David gained great favor at Saul’s court and popularity among the people. He became the close friend of Jonathan, the king’s son; marries Saul’s daughter, Michal; and has great success as a battle leader. However, Saul grows jealous of David and seeks to kill him (I Sam 18–26). David flees from the court for his life and runs as a fugitive with 600 loyal followers to the Philistine King Achish of Gath (I Sam 27). But as events transpire, David is spared from fighting with the Philistines against Israel, in a battle where Saul and Jonathan are killed.

This is not simply political diplomacy on David’s part, though it is that. On a deeper psychological level, David’s actions speak to his spiritual character. Although he is loyal to King Achish, he continues to love King Saul and Jonathan as well and the God of Israel. When Saul

and Jonathan are killed in battle against the Philistines on Mt. Gilboa, David is deeply stricken, composing a beautiful lament for them: "Oh beauty of Israel. On your high places lie the slain. How the mighty have fallen. . . ." (II Sam 1: 17f).

How different David is in this regard than the legendary Roman soldier Coriolanus. As recounted by the historians Plutarch (1978, pp. 15–52), Livy (1960, p. 32f) and Shakespeare (1865), Marcius's military valor at Corioli against the Volsci wins him the honorary name of Coriolanus. He soon becomes embroiled in angry class arguments in Rome. His outspoken insults to the plebeians lead to his banishment. Infuriated and obsessed with wreaking revenge on Rome, he goes to the Volsci and persuades them to attack Rome. Unlike David, Coriolanus seems incapable of any genuine love or loyalty to anyone and is guided only by his rigid inhuman code of how a warrior should act.

I and II Samuel go on to narrate David's many adventures and his human growth through often difficult times. David is elevated to be king over the tribe of Judah, while the other tribes follow Saul's son Ish-Bosheth (II Sam 4:4). David's main center is in Hebron, where he rules for 7½ years until Ish-Bosheth was assassinated by his own retainers, after which David is accepted as king over all Israel, making Jerusalem its capital. David's personal life is often turbulent. He marries 18 women, among them, Michal, Abigail, and, finally, Bathsheba.

David's relationship to Bathsheba begins when he sees her bathing from his roof and is taken with her. He sends for her, even though she is still married to Uriah, one of Joab's officers, who is off in battle. In such a situation, Israelite soldiers customarily gave their wives a conditional divorce before leaving for battle so that she may not become a "grass widow" (*Babylonian Talmud*, Shabbat 56a). In any case, David lies with her and she becomes pregnant. When she informs David, he summons Uriah, hoping he will lie with Bathsheba and think the child is his. However Uriah refrains, feeling it would be disloyal to his men in the field. This subterfuge failing, David orders Uriah back to the field in a very dangerous

spot and has him abandoned. He is killed in battle, and David weds the pregnant Bathsheba. She bears him a son and this is evil in the eyes of God. (II Sam 11). As Bathsheba's spiritual character and wisdom unfolds, however, it becomes apparent that David's desire for her was not simply an example of his physically "following his eyes" that led to the undoing of Samson with Delilah (*Babylonian Talmud*, Sotah 9b).

II Sam 12 begins with God's sending Nathan to confront David with the wrong that he did. Nathan does not do this directly but begins by presenting David with the famous parable of a rich man with much livestock taking the only ewe from a poor man. This represents a very sophisticated psychotherapeutic tool whereby one can instill a truth in a patient by circumventing his defenses. When David expresses his anger against the rich man, Nathan tells him "You are the man." David atones for his act and does not die, but the son borne from this union does die. He is forgiven and Bathsheba bears him another son, Solomon, a brilliant man who will ultimately succeed David on the throne. David wants to build the Temple to God, but God told him that although He loves David very much, the Temple would have to be built by a king (Solomon) who has no blood on his hands.

David had many wives and thus many children who were half brothers and sisters. His many sons could cause problems. Amnon raped his half sister Tamar and was murdered by Tamar's full brother Absalom. Absalom later rebels against David and comes close to dethroning him before he is killed (II Sam 13–18). David never stops loving Absalom his son, grieving mightily for him when he hears of his death (II Sam 19:1–19:9). Upon hearing of his rebellious son's death, David weeps and laments "My son, Absalom. My son, my son, Absalom! Would that I had died in your stead" (II Sam 19:1). These words become the title of a play *Absalom, Absalom* by William Faulkner (Faulkner 1990).

David was a man of many remarkable abilities and of great emotional depth. Warrior, king, poet and saint; no matter what he did, he could not exist without a feeling of closeness to God. David never forgot his origins as a shepherd, and he loved his

people with the devotion, love and care he had given to his sheep. His courage in many difficult moments was based on a total loving faith that God created and guided the world and that he had only to follow God's plans, and that whatever God would do would be for the best. It is a faith that shines also from the letters of a great American commander Robert E. Lee almost 3,000 years later (Lee 2007).

David expressed this faith deeply in his poems, some of which are included in the Psalms. One of the most famous is the 23rd Psalm: "The Lord is my shepherd, I shall not want. . . Your rod and Your staff comfort me." Other notable chapters in the Psalms are as follows: (3) "A song of David as he fled before Absalom his son." and (51) "To the choirmaster: A song of David. When Nathan the Prophet came to him when he went to Bathsheba."

No known contemporary sources mentioned David until the recent finding of one inscription in the biblical archaeological site in Israel at Hazor. Archaeologist Eilat Mazar believes that some large buildings she has unearthed in Jerusalem from about 1000 BCE are David's palace, (Erlanger 2005) though this claim is questioned by others (Finkelstein et al. 2007).

As the founder of the line of Jewish kings and the ancestor of the messiah and an author of Psalms and the subject of many midrashic stories, David remains an important figure. He is psychologically balanced between warrior and musician/poet and is a warrior, lover, and God-fearer. He is introspective, diplomatic, and active and a promising youth and wise King. Body and soul are both important. It is a strength of the biblical narrative that it does not whitewash his actions toward Uriah. He is not perfect, but whole. When he trespasses with Bathsheba, he repents. Throughout his life, David is "gripped with the spirit of the Lord" (I Sam 16:13).

Deadly Sins

Anastasios Viskos
Aristotle University of Thessaloniki,
Thessaloniki, Greece

Introduction

The concept of Deadly Sins has been studied by several researchers, specializing in many disciplines. Two of these disciplines are those of Psychology and Theology. Deadly sins are often associated with vice (Green 2013) or generally considered to be lacking in goodness, or simply considered to exert particular pressure on a person, leading him to an extremely difficult situation.

In view of the above, it is appropriate to set out some elements on Deadly Sins coming from the two above-mentioned scientific disciplines, with the aim of a more general and more accurate multidisciplinary assessment of the subject under consideration.

Also, it is to be said that the teaching of deadly sins belongs to Christianity and therefore the analysis will be made with references only to that religious tradition.

Deadly Sins, According to Psychology

Sin, in the view of modern psychology, is the violation of a principle or of defined moral laws, usually followed by the feeling of *guilt* (Papadopoulos 1996), a feeling which, as has been observed, holds a central place in the teaching of Existentialism (Pelegriinis 2004). Therefore, the person is in an inner mental state in which he recognizes that he was wrong (Papadopoulos 1996).

The deadly sins, as they are commonly called, are numbered in seven and are as follows: (i) anger, (ii) envy, (iii) greed, (iv) lust, (v) pride, (vi) gluttony, and (vii) sloth (Vrabel 2018).

In the past, melancholy has also been described as a deadly sin, which, if ignored, leads to the

acceptance of eight deadly sins (Nauta and Derckx 2007; Nauta 2008).

In the studies of Capps (e.g., 1987), there is a link between deadly sins and narcissism (Nauta and Derckx 2007; Nauta 2008). A central role, as it turns out, is played by the sins envy and pride, while equally important, but more personal and internal, is the sin of melancholy (Nauta and Derckx 2007; Nauta 2008). More generally, this which could be observed is that because sin creates guilt, as told above, it can lead to introversion, which is likely to cause serious problems in the behavior of the individual. Finally, it has been argued that the person who is guilty of a delinquent act, which can be considered a sin, often has no moral barriers (Green 2013).

Deadly Sins, According to Theology

According to Capps, sins are detrimental to human life and to the will of God (Capps 1987; Zock 2018). This view is in perfect harmony with the Christian teaching of sin, which is found in the texts of the Holy Bible and of the Church Fathers.

The roots of this teaching come from the narrative of the book of Genesis of the Old Testament, where the creations of God, Adam and Eve, disobey the Divine Will (Gen 3:1-24). Their disobedience led them to fall as well as the entire humankind. Of course, humans cannot be understood as the rapporteur of evil but as victims who were swept by evil and fell into sin (Mantzaridis 2010).

Evagrius Ponticus speaks about eight evil thoughts, through which the devil tries to prevent the monks from dedicating themselves to God. This opinion, affected John Cassian, who passed it on to the West. Thus, already in the fourth century, a list of deadly sins appears. (Bejczy 2018).

In other texts of the Christian literature and especially in those that appear in the East Christianity and are related to the teaching of deadly sins, things do not seem so meticulous. In more detail, many of these texts do not place special emphasis on the distinction of sins into

deadly and non-deadly but urge believers to fight any weakness that could lead them to sin (Mantzaridis 2010). Although it is believed that sins should be distinguished in deadly and non-deadly (John I 5:16), for pastoral and pedagogical purposes, it does not appear to be the main point in the Fathers' thought in the East. In this light, deadly sin could be characterized as every sin for which human does not repent (Mantzaridis 2010).

This perception can deny guilt from human, and hence to escape from the introversion, which is likely to be guided by committing a sin, as through true repentance all sins are forgiven.

Therefore, through the Mystery of Holy Confession and by extension of Repentance, which is considered to be the second baptism – the baptism of tears – humans escape introversion and guilt created by sin. Clearly, all of the above cannot be understood outside of the Church body (Mantzaridis 2010).

Conclusion

From what has been explained above, the significance of understanding the term sin and consequently the concept of deadly sins is perceived. It became clear that these sins, from a psychological point of view, create feelings of guilt and introversion, situations that can lead the individual to serious behavioral problems.

From a theological point of view, sin is connected with the free will of humans and it is considered more important the meaning of confession and repentance than the separation into deadly and non-deadly sins.

Death Anxiety

Bonnie Smith Crusalis
Albuquerque Psychiatry and Psychology
Associates, Albuquerque, NM, USA

Definition

Fear of death can be defined as the anxiety experienced in daily life caused by the anticipation of death. It can be the result of facing death through

illness and aging or experiencing circumstances that force a confrontation with the idea of death. It can also include many aspects of dying, such as pain and suffering, feelings of abandonment, loss of dignity, and of “nonbeing,” not living up to one’s potential (May 1983; Heidegger 1962).

Denial

... No one believes in his own death. In the unconscious, everyone is convinced of his own immortality (Freud 1953–1966).

Ernest Becker, the author of Pulitzer Prize winner, *The Denial of Death*, maintains that death denial is a basic human motivation and a universal biological need. The terror of death is so overwhelming, he says, that man conspires to keep it buried in the unconscious network of defense mechanisms where it is repressed.

Irvin Yalom, noted American existential psychiatrist, would agree that death anxiety is a basic tenant of human existence. Rarely though, Yalom maintains, do clients present in therapy settings with the complaint that they fear death. Instead, they appear with a variety of death anxiety-avoiding coping mechanisms and denial-based strategies that are not effective.

Boundary Experience

Regardless of Yalom and Becker’s contention that fear of death underlies anxiety in general, death anxiety is not always buried. Columbia University’s Dr. David Forrest discusses a “readiness” or Mortality Stage in which a physically healthy, cognitively intact individual reaches the end of the emotional denial of death and becomes acutely aware of his or her own mortality. The Mortality Stage is so distinct that all of life prior to this stage can be subsumed under the rubric the Immortal Stage. Experiences that trigger the Mortality Stage can be any loss or events such as war, terrorism, famine, genocide, pandemics, or even minor accidents. A “boundary” experience is

Yalom’s term for this heightened awareness, which he defines as an event or urgent experience that propels one into a confrontation with one’s mortality.

Death Gives Life Meaning

Because the heart of existentialism and existential therapy is the attempt to resolve the conflict or tension created when an individual confronts one of life’s ultimate concerns such as death, existential therapy, essentially an exploration of one’s life meaning, has been used successfully to integrate spirituality into end-of-life care (Breitbart 2004). Prior to the public awareness and acceptance of the work done by Elisabeth Kübler-Ross, end-of-life care was primarily concerned with symptom control and pain management. Following Kübler-Ross’ *Death and Dying*, palliative care literature began to emphasize a need for a greater emphasis on spirituality and meaning along with interventions to help patients examine these areas of their lives. It is this examination that offers an individual the potential to live purposefully by embracing the inevitability of death.

“Though the physicality of death destroys us, the idea of death may save us” (Yalom 2002, p. 126). English existentialist Emmy van Deurzen agrees “Life and death are two sides of one coin. They cannot be had without each other, they should not be kept apart and in isolation.”

Death Rituals

Kabir Saxena
Tushita Mahayana Meditation Centre, Delhi,
India

Fear and anxiety are two very basic and all-pervasive human emotions, and nothing seems to constellate them more precisely and powerfully than death, my death, yours, and other peoples' deaths. Even in times gone by, when human beings were more deeply linked with the natural world and the cycles of living and dying, death was still a strong catalyst for immediate restorative actions aimed at healing the wound to the community caused by an individual demise; the jolt to the continuum of eating, speaking, and acting linked to a personal or even group will. And yet, hope and celebration are also important aspects of our experience, and it appears clear that

death also brings these to the fore so that they can nourish the multiplicity of rituals and practices that surround this most challenging of human experiences.

What needs to be taken care of when somebody dies? One must posit three entities in this drama. There is the body, obviously. More of that later. Then comes, for many individuals and cultures at least, some need to provide for that which may continue – variously called spirit, soul, mind, mental continuum – and ensure that this non-bodily essence is given all the help it needs to carry on towards either higher evolution or whatever is deemed appropriate in the culture and also to prevent it from coming back to haunt the living and settle scores on unsuspecting survivors!

The third entity is of course the vast majority, the people left behind, those individuals grieving or rejoicing, even the society as a whole if it's a well-known personality or figurehead who managed to touch a chord in the zeitgeist or collective consciousness of the time/race/society. For this latter point a thorough exploration of the aftermath of say, Mahatma Gandhi's or Princess Diana's deaths, would prove revealing. There, we have a reminder of how powerful a shock to the national psyche an individual's death can be and how critical to restore some equilibrium through mass rituals involving candles, flowers, praise, and much more. Why? Because what could remind us better of our own mortality than the death of the rich, beloved, and famous, what could arouse our anxiety better, or indeed our love and compassion, our anger, our guilt, our own longing for redemption and forgiveness, not to mention plain and simple happiness and the need to restore a sense of the power of life to outlive death? (Davies 2002). For insight on our need to defeat, transform and confront death see Ferris (1989) on Dylan Thomas, author of the masterful poem, "*And Death shall have no Dominion*." Since so many emotions can be caused to erupt by this destruction of the bodily element, is it surprising that the rituals surrounding it are so necessary and often complex and of long duration?

Aspects of Selected Rituals

People influenced by Tibetan Buddhism try not to move the body for a few days so as not to inappropriately hasten the exit of the consciousness or at least try to touch the crown of the head only since the place of exit of the subtle mind is said to determine the realm of rebirth.

Many Hindus quickly cremate and in outdoor traditional cremations, the skull is cracked open by the elder son to allow the soul to depart. If possible Ganges water is forcibly inserted between the lips for purification. Many cultures used to try to give a 3-day or so gap after death before the body is disposed to allow time for the consciousness/soul/spirit to exit appropriately, but in modern times, due either to haste, change in beliefs or more mundane factors such as heat and lack of refrigeration facilities, the body is considered merely a totally inanimate object to be quickly removed from the environment of the living. In the past, in Tibet, for example, sky burials were performed, in which the body was chopped up, mixed with barley flour, and fed to the vultures at an elevated spot. Prayers would be performed by monastics during this process, involving ritual bells, scepters, thighbone horns, and drums. In this way local landlord spirits were placated, and higher beings such as Buddhas, Bodhisattvas, and Dharma protectors were invoked and requested for help in guiding the mind of the departed to happy rebirths.

See the fascinating discussion of the Wari' of Brazil, (Conklin 2001), as a counterpoise to say, the attitude of the Tibetan Book of the Dead (Sogyal Rinpoche 2008) (or indeed modern western attitudes towards death), to see how we cannot safely presume that all cultures would find an animal rebirth anathema or regard eating one's dear departed as repugnant. For the Wari', it is fit to be reborn as game that in turn feeds the next generation of hunters and eating the dead was considered, at least as late as the 1960s, as compassionate and respectful, acting as a link between living and dead and a focus for channelized grief. Superficial analysis of these unusual rituals may

simply galvanize a morbid and twisted understanding of these processes. If we were born into the pre-1960s Wari' society, we'd understand it as part of our seamless world view, undisturbed as yet by mobile phones, established theistic religion, and reality TV. That others may indeed find it barbaric and a sign of ignorance is here quite beside the point.

Let us explore this all a little deeper. It is an inescapable fact that for some relentless work and routine become the means to offset the fear of death, the unknown, and yet even a whole lifetime of work does not guarantee avoiding an abiding leitmotif of unease. So, when death actually occurs to somebody you know, rituals provide an accepted means of satisfactorily and legally putting a seal on a life and releasing the survivors to carry on with their lives. There are so many levels in this. The minimalistic death, deliberately designed to cause least disruption to the community (and practiced by the evolved, the brave, or the rejected even perhaps), is to walk out into the cold and freeze to death unseen and uncharted by others, as practiced formerly by the elderly in some Native American peoples and by a famous British explorer. This, however, is in fact hard on those left behind and most people have need of a good funeral – “we gave him a good send-off.” And there is such variety in this send-off: prolonged, professionally arranged weeping, chest thumping, feverish massaging of feet, tight bandaging of the body, or quiet meditation, prayers and pujas, and chanting for 40 or 49 days. Nowadays we need to acknowledge that death is good business too and the standardization of the process is marked, despite small exceptions maintained to boost local tourist industries.

Changes Over Time

What was in a rural community a complex event performed attentively with intimate knowledge of the deceased has all too often become, in the fast-paced anonymity of the urban sprawl, a rapid

procedure, a production one might say, in which the religious element is often the shortest and the food and socializing afterwards of more importance (see Davies 2002). After all, the need of the hour is to adjust to a new situation and even more so to carry on with life. To many it's quickly back to business as normal, especially for those really too busy to see the funeral as anything but a brief interlude in a day full of other work and social engagements.

We see in the contemporary milieu how death can be trivialized in the sense that deeper issues are being deliberately avoided so as not to rock the boat of hard-fought-for but tenuous mental security; however, much self-deception may be involved. The dearly beloved (or most hated), in India, for example, is always made to depart for their "heavenly abode"; their enlarged photos are garlanded as though they were deities and all this in a culture that has long traditions of not only believing in but describing hells and other states of woe in detail that might surpass even Dante. The ritual relieves the anxious itch temporarily but does not often address the deeper need to properly assimilate the sadness, as well as come to terms with one's own mortality.

But of course for some, the rituals of death are long, profound, even agonizing, and/or liberating. What if you believe, both as a matter of personal conviction as well as due to faith in a particular religion, that your behavior will definitely influence the welfare of the departed? In other words what if you are profoundly convinced that you can actually contribute to the happy future of a being whose rebirth you or an evolved practitioner could strongly influence through ritual? And what about those for whom a loss seems the end of the world, who seem inconsolable, in despair? It is clear that the short-term rituals of a few days, although perhaps temporarily useful, seem paltry in the face of the larger issue. Which is why in any discussion of this subject it seems that, to be at all meaningful and effective, a great deal of wisdom, love, and patience is needed to inform

any of the processes that take place at this time, and that in the end individuals have to come to terms with death in their own hearts and minds as they engage in the process of reflecting, analyzing, accepting, forgiving, and any number of other inner methods to adapt to a world that has changed, an inner and outer landscape without that one significant other. The Tibetan tradition encourages personal retreats aimed at mental and spiritual purification as well as practices to actually benefit the dying and the dead. If one looks at the issue of death as pertaining not just to physical death but to the necessity of constantly letting go of the old or outworn, as in again and again in our daily lives separating from that which is familiar or desired, each night dying to the day in preparation for the rebirth of morning, then we might glimpse another whole set of habits and rituals, both inner and outer, that help us set the compass to changing circumstances. These mental patterns or inner rituals are no less real for not being the subject of as much learned discourse as their outer counterparts and eastern psychology would hold that the inner is key. What we perform externally largely reflects an internal understanding and need.

Decolonization and Psychology

Jeffrey Paul Ansloos

Department of Applied Psychology and Human Development, Ontario Institute for Studies in Education – University of Toronto, Toronto, ON, Canada

Introduction

The meaning of decolonization is multi-dimensional with various interpretations across disciplines. Decolonization in relationship to the discipline of psychology has been understood primarily in terms of its historical emergence as a critical political theory movement and has more recently been re-examined in the paradigmatic and methodological sense. While the topic of decolonization has various historical and contemporary debates, in recent years, there remain critical tensions which have emerged in terms of decolonization and psychology. These tensions and implications for research and applied practice in psychology are explored in this article, in particular, as they relate to the psychological study of religion and spirituality.

Decolonization and Psychology, Theoretical and Historical Foundations

Scholarship on decolonization gained prominence in the twentieth century, in large part due to what has come to be known as the postcolonial movement, which includes, among others, critical scholars such as Aimé Césaire (1955), Albert Memmi (1965), Frantz Fanon (1968), Edward Said (1979), and Gayatri Chakravorty Spivak (1988). These critical scholars have taken aim at European and Western colonial endeavors. For some, this work coincided with movements of independence from imperial rule (i.e., transitioning political sovereignties), which meaningfully coincided with the rise of secularism. For these scholars, postcolonial literally refers to the

time period coinciding with the demise or immediately after imperial rule. For others, postcolonial scholarship has taken place within historical and neocolonial struggles for comprehensive self-determinism, which has been framed diversely as a social, political, cultural, and spiritual process.

Across postcolonial studies, colonialism has referred to the dynamic and multifaceted practices of imperial political dominance. Through practices of colonial subjugation, one sovereign political entity exerts power over another sovereign political entity, typically on an ideological basis which denies the latter sovereign recognition. Colonial practices have taken various forms, technologies, and manifestations (i.e., settler-colonialism, apartheid, and extractive-colonialism), and this has often been perpetuated through social structures and institutions, including organized religion. Christianity in particular, within the organized expressions, had a substantial role in colonization, ranging from epistemic foundations (i.e., the doctrine of *terra nullius*) to institutionalized practices (i.e., religious orders running residential schools).

With the postcolonial scholarship of Franz Fanon, psychoanalysis was used to develop an understanding of colonial identities, both in terms of the colonizer and the colonized. From Fanon's vantage, colonization constructs a colonial subject (the colonized) through psychological internalizations of inferiority and shame. Similarly, the colonizer is constructed through internalizations of superiority, which is constructed through propagating imperial myths (i.e., manifest destiny, racial supremacy). Applied to notions of religion and/or spirituality, colonization is a process whereby Indigenous ontologies and epistemologies are represented in the colonial imaginaries as "mystical" and "pagan" and then contrasted against the construction of Christianity as "civilized." The internalization of these ideologies were critical to the formation of colonial practices which sought to suppress Indigenous sovereignties, even the sovereignties of spirituality. Theorists such as Césaire (1955) and Memmi (1965) emphasized the socially constructive function of race in processes of colonization. Said

(1979) and Spivak (1988) further developed theories of colonization by demonstrating how colonial subjugation necessitates a process of social othering, which is through experiences of humiliation, denigration, exoticism, fetishizing, and tokenism. Through these practices, the colonizer created the interpretative categories for subjective otherness, in turn, axiological frameworks to justify their colonial dominance. While this is not a comprehensive decolonial analysis, the most substantial uptake of postcolonial theory in psychology has happened on this front, that is, as a means for interpreting processes of social oppression. This component of postcolonial theory has been explored widely in psychological research. In the context of research on psychology of religion and spirituality, there is an important consideration that emerges from postcolonial scholarship, which is to problematize the relevance of the anthropological gaze, and consider instead, the methodological implications of Indigenous sovereignties and self-determinism.

Postcolonial scholarship, while primarily offering a critical analysis of colonialism in drawing on psychological theories, also pointed in the direction of a methodology to address the personal and structural violence of colonialism, and that is, *decolonization*. Generally, decolonization (and/or decolonizing) as a theory refers to both a paradigm and process for political self-determinism which takes shape through various practices including social and political actions, including revolutions and indigenization. In the context of early postcolonial scholarship (Fanon, Cesaire, Memmi), the processes of social and political action were oriented by calls for revolution, within the Marxist tradition. It is important to note that this was a call for revolutions on the material level, in hopes for redistributions of power and economic resources. Spivak (1988; Spivak and Morris 2010) has uniquely emphasized the critical importance of recognizing colonialism as something which occurs epistemically. That is to say, decolonization can only occur as a comprehensive process, material, and otherwise, when Indigenous people can be heard within their own frames of reference. In regards to religion and

spirituality, this provides a unique alternative to the secularist humanism espoused by much of the early postcolonialists. Decolonization in this sense is not merely a critique of Christianity but a reclamation of Indigenous spiritualities in their diverse constitutions. On the level of paradigmatic principles, postcolonial notions of decolonization draw on the psychoanalytic idea that insight can embolden different forms of social and political action, and for the purpose of the colonized, understanding the process of colonial subjugation can raise critical consciousness, embolden self-determined subjective agency, and lead to redistributions of power, both internally and externally. Contemporary decolonial scholarship alternatively emphasizes a notion of embodied and relational practices of Indigenous spirituality as pathways to sociopolitical freedom (Alfred 2005; Ansloos 2017).

Decolonization and Psychology, Paradigm and Methodology

While postcolonial scholarship has continued to develop and has come to influence both theoretical, philosophical psychology as well as applied fields of psychology, the predominant emphasis of these movements has been on the paradigmatic. As a paradigm, decolonization responds to a particular problem, the violence of colonialism. Within population-specific studies among Black, Indigenous, and other people of color, the violence of colonialism is one of the most frequently cited complex etiological factors in consideration of mental health outcomes. Decolonization has also been paradigmatically situated as an ethical commitment in contemporary movements of psychology (critical, community, cultural, Indigenous), where frameworks that center human rights and Indigenous rights are emphasized. Decolonization has also been utilized to examine the psychosocial impacts of the introduction of colonial religion.

This has had substantial implications for methodology, including the importance of processes of Indigenization in psychology which emphasize

cultural preservation, revitalization, reconstitution, and evolution of Indigenous culture and community. In the applied practice of psychology, this has led to an increased interest in culturally and contextually informed approaches to psychological research and practice, community-based approaches to mental health and cultural psychology (Duran and Duran 1995; Kirmayer and Valaskakis 2009). While the response to colonial violence has resulted in grounded commitments to anti-oppression and indigenizing practices within psychology, a tension remains. This tension surrounds the question of whether the idea of decolonization has been conflated in the methodological sense, with Indigenization within the epistemic framework of neoliberal multiculturalism and anti-oppressive practice (Nelson and Wilson 2017). In the context of research on psychology of religion and spirituality, this means that merely incorporating an appreciation for Indigenous spiritualities without abandoning anthropological research practice engenders colonial complicity. Increasingly, Indigenous scholars are asking whether psychological practices which might intersect with, unsettle and reconfigure systemic and structural forms of colonialism. Tuck and Yang (2012) suggest that decolonization is not a metaphor, but as a political methodology has distinct material aims. Psychology has used the post-colonial analysis to consider dynamics of power in various experiences of social oppression, often conflating material forms of colonial violence (i.e., settler colonialism) with other forms of social oppression and marginalization. Nonetheless, there are some contemporary examples of psychological approaches which draw on the material aims of decolonial theory to pursue structural change including the field of Liberation psychology (Martín-Baró 1994) and contemporary Indigenous psychologies (Sundararajan and Raina 2015).

Defenses

Giorgio Giaccardi

British Jungian Analytic Association, London, UK

Defenses are ways by which the psyche aims at avoiding threatening affects, above all anxiety. The notion of defense was introduced by Freud with reference to hysteria (Freud 1894, p. 47). The defense mechanism involved in hysteria is

repression, which causes the expulsion of a painful affect or idea from the conscious ego. During the following 30 years, Freud would use the term repression with reference to defensive processes in general. This special status of repression was due to its role in the constitution of the unconscious as such. In 1925 however Freud reintroduced the concept of defense as an inclusive category encompassing not only repression but also other mechanisms which he had been identifying in the meanwhile (Freud 1926, p. 163). The analysis of ego defenses was to become subsequently a major theme in psychoanalysis, thanks also to the pivotal study on the topic by Anna Freud.

A subsequent line of development, which paralleled the extension of psychoanalytic theory and practice beyond neurosis and its application to borderline, narcissistic, and schizoid personalities, consists of the analysis of primary defenses (also named primitive, dissociative, archaic, psychotic, and archetypal).

Ego Defenses

When the ego experiences distressing affects resulting from the perceived incompatibility of an experience, idea, or feeling, it succeeds in defending itself from the related anxiety by “turning this powerful idea into a weak one” and “robbing it of the affect – the sum of excitation – with which it is loaded” (Freud 1894, p. 47). The sources of anxiety are superego demands, external situations, and overpowering or conflicting instincts (Freud 1936, pp. 54–65). Neurosis occurs when a defense mechanism fails to ward off anxiety or when other portions of the id claim a “compensation” – in the form of a symptom – having being damaged by the operation of a mechanism of defense (Freud 1924, p. 183). Exceedingly rigid defenses loosen the relation to reality and hold up the emotional development of the individual (Winnicott 1985a, p. 168).

Freud also regards religion as a form of collective neurosis based on regression to infantile

dependence on the father, rooted on childlike feelings of impotence and defending against superego anxiety. Specific defense mechanisms employed are obsessive ceremonials, devaluation of intellect, and altruistic surrender, all in the service of repressing instincts thus avoiding related guilt and anxiety. Freud notes that the impulses that religions strive to suppress are not merely of a sexual nature but concern any instinct that “springs from egoistic sources” (Freud 1907, p. 127). One typical defense against such instincts was identified by A. Freud as “altruistic surrender” of “our own instinctual impulses in favor of other people” (Freud 1936, pp. 11–134).

A. Freud lists nine basic mechanisms of defenses: repression, regression, reaction-formation, isolation, undoing, projection, introjection, turning against the self, and reversal into the opposite, to which she also adds sublimation as a more sophisticated and complex defensive activity of the ego (Freud 1926, p. 44). However, this list is far from exhaustive, as A. Freud herself goes on to describe further mechanisms such as identification with the aggressor and denial. All aspects of mental life can serve a defensive function. For instance, McWilliams (1994, pp. 117–144) also includes intellectualization, moralization, and sexualization among the defenses of the ego. Jung’s notion of regressive restoration of the persona (Jung 1966, pp. 163–168) may also be regarded as a defense mechanism against anxiety.

Defenses may be classified according to the nature of the mechanism which protects from anxiety, which might either affect the instinctual process itself (like displacement, reversal, and turning round upon the self) or merely prevent it from being perceived by the ego (like repression and projection). Bowlby suggests that the operation of defense mechanisms can be spotted when patterns of behavior, thought, or feeling “[are] carried out under pressure, absorb an undue proportion of the person’s attention and [are] visibly undertaken at the expense of something else” (Bowlby 1980, p. 66).

Jung often refers to repression of psychic contents as the process constituting the personal shadow. He views confrontation with the shadow as a moral problem and an essential task in the process of individuation – a viewpoint which underpins his aim of “treating” Christianity by showing the importance of integrating the repressed, or “missing fourth,” into its conscious attitude (Stein 1985, p. 171). However, Jung is also of the opinion that as long as a defense works, it should not be broken down as the patient may need it as a protection against overwhelming experience. This is particular so in the case of defenses with a religious content, like the “Catholic defense” (Jung 1958a, p. 45), on which Jung writes: “If the patient is a practising Catholic, I invariably advise him to confess and to receive communion in order to protect himself from immediate experience, which might easily prove too much for him (...) I reinforce a means of defense against a grave risk, without asking the academic question whether the defense is an ultimate truth” (Jung 1958a, p. 44). But if the patient’s dreams “should begin to destroy the protective theory,” Jung feels that he has “to support the wider personality” of the patient (Jung 1958a, p. 45), in other words work on his/her individuation. This latter aim cannot always be pursued, as the need to maintain the defense may be paramount: “People may have to go back to the Church when they reach a certain stage of analysis. Individuation is only for the few...” (McGuire and Hull 1980, p. 394).

A concept related to (but distinct from) defense is resistance, which is the force that protects the work of defenses and its accessibility to the conscious ego. Overcoming resistances is for Freud one of the cornerstones of the psychoanalytic enterprise. In *Analysis Terminable and Interminable*, he identifies five types of resistances, of which three derive from the ego (repression, transference resistance, and resistances which proceed from secondary gains), one from the id (repetition compulsion), and one from the superego (unconscious guilt and need for punishment) (Freud 1937, p. 238). The latter two account for

what Freud came to recognize as sources of an intractable resistance to the analytic cure (negative therapeutic reaction). In particular, the archaic superego in Freud’s late view takes on split-off aggressiveness and thwarts recovery by attacking the ego. This new understanding proved pivotal in the development of the study of primary defenses.

Primary Defenses

According to Melanie Klein, primitive defense mechanisms are aroused by two forms of anxieties that derive from the activity of the death instinct (or fear of annihilation), i.e., depressive and persecutory anxieties. Defenses against the former are manic ones (omnipotence, denial, triumph, and contemptuous control), while the main defenses against persecutory anxieties are splitting and projective identification. All these are called primitive defenses because, as Freud noted (Freud 1926, p. 164), they are employed before the separation of ego and id and the formation of the superego.

Winnicott examined in detail manic defenses, which use external objects “in the attempt to decrease the tension in inner reality” (Winnicott 1975, p. 132), specifically by denying depressive anxiety and guilt. Ultimately, manic defenses use reality as a reassurance against the experience of death. Any form of psychological organization (including psychosis itself and the experience of oneness with God/universe) which effectively defends against the threat of breakdown and annihilation may work as a primitive defense.

Winnicott also suggested that the ascension of Christ could be seen as an instance of manic defense of an “ascensive” nature, psychologically akin to light-headedness and elation: “Each year the average Christian tastes the depths of sadness, despair, hopelessness, in the Good Friday experiences. The average Christian cannot hold the depression so long, and so he goes over into a manic phase on Easter Sunday” (Winnicott 1975, p. 135). Another example of manic defense in

religion is when an aspect of reality is not acknowledged as internal, like “a preacher [who] feels as if God speaks through him,” but denies his own “parenthood of the internalized object” (Winnicott 1975, p. 133). However, in line with Jung’s position of respect for defenses, Winnicott also emphasizes that “in the analysis of the most satisfactory type of religious patient it is helpful to work as if on an agreed basis of recognition of internal reality, and to let the recognition of the personal origin of the patient’s God come automatically as a result of the lessening of anxiety due to the analysis of the depressive position” (Winnicott 1975, p. 133). On the other hand, antireligious attitudes could be seen as manically defensive too: people in analysis “jeering at religion (. . .) are showing a manic defense in so far as they fail to recognize sadness, guilt, and worthlessness and the value of reaching to this which belongs to personal inner or psychic reality” (Winnicott 1975, p. 135).

Archetypal Defenses

Kalsched offers a post-Jungian formulation of primary defenses in which they are referred to as “archetypal defenses” and “defenses of the self” because they “seem to be coordinated by a deeper center in the personality than the ego” (Kalsched 1996, p. 17). They cause a split in the psyche between a progressed part that protects “whatever is left of true selfhood” (Kalsched 1996, p. 174) and a regressed part that encapsulates what Kalsched names the “personal spirit” of the individual. Splitting allows disconnecting from unbearable affects and annihilation anxiety, at the cost of blocking individuation, i.e., the incarnation of the self in life. Both parts are experienced by the ego as “daimonic objects” through which “divine activity could be glimpsed – either for good or for evil” (Kalsched 1996, p. 148). Kalsched envisages in the ultimate antilife character of these defenses a “compelling image of what Jung called the dark side of the ambivalent Self. (. . .) The damage to the inner world is done

by the psyche’s Yaweh-like rage, directed back upon the self” (Kalsched 1996, p. 17).

Kalsched’s formulation mostly draws upon Winnicott’s false self (Winnicott 1985b), Bion’s attack on linking (Bion 1984), Stein’s archetypal defenses (Stein 1967), and Fordham’s defenses of the self (Fordham 1974), which Kalsched amplifies and develops by delving into the archetypal perspective. Fordham, in particular, observes how defenses of the self oppose and undo any potentially developing link and aim “to keep the way open to regression, or maintain it as it is” (Fordham 1974, p. 193). The direction of this regression is towards “an infantile perverted state of mind” (Fordham 1974, p. 198). As Marcus West argues throughout his recent study of narcissistic disorders (West 2007), this form of regression is particularly enticing for people whose ego functioning is so underdeveloped that they constantly need a vicarious self-regulating other. In this process – in which projective identification is the main defense mechanism involved – they experience very intense affects, of a positive sign if sameness is registered and negative if this expectation is frustrated. In both cases, emotions may have an ecstatic and numinous quality which, however, as West concludes, may militate against the development of the ego, thus further enhancing recourse to primary defenses.

Hillman’s take on defenses brings a different understanding of the psychic processes regulating instincts and affects. He draws upon Jung’s contention that the archetypal image and the instinct belong together in the same archetype, the images being regarded as self-portraits of the instincts. Jung already recognized the connection between defenses and images: “Instinctive defence mechanisms have been built up which automatically intervene when the danger is greatest, and their coming into action during an emergency is represented in fantasy by helpful images which are ineradicably imprinted on the human psyche” (Jung 1958b, p. 345). Hillman further elaborates this idea by arguing that any archetype has in itself an instinct-inhibiting power, which does not deny or displace or reverse the instinct, but makes full

experience of it through its related images and may influence instinctual behavior by reflecting on and transforming the images. This form of defense differs from sublimation because it maintains the connection to the original instinct while allowing alternative outlets other than compulsive action or flight. Hillman exemplifies his argument by showing the self-inhibiting properties of instinctual phenomena linked to Pan, like panic and masturbation (Hillman 2000). Similarly, Murray Stein refers to the self-inhibiting properties of the archetype as “healthy paranoia” (Stein 1983, p. 95) and maintains that both the drive to meet the unconscious and the protection from it stem from the same god, Hermes. In this approach, instinct regulation, psychological reflection, and pursuit of wholeness – which has a numinous quality, because active and conscious encounter with the unconscious is “an essentially religious struggle” (Stein 1983, p. 105) – are intertwined in a way which is quite far from the Freudian conceptualization of a trade-off between instinct and civilization. The implications of this position on religion are far reaching, particularly on the importance for religious images, symbols, and rituals of remaining in touch with the instincts which they also have the function to inhibit and contain.

Deity Concept

David A. Leeming

University of Connecticut, Storrs, CT, USA

Blanton-Peale Institute, New York, NY, USA

Deities are created by humans – usually in their image – to express our sense of where we came from and to express a sense of significance and protection. Deities are believed to be aware of us and our needs. They are ultimate progenitors and ultimate parent. Psychology has taught us how important our mental depictions of and memories of our parents are to any real understanding of our own identities. As far as we can tell, the concept of divinity has almost always been present in human consciousness and human life. We have indications of the concept at least as early as the cave paintings, rock carvings, and other artifacts of the Paleolithic. Deities of many sorts have arisen over time. Sky gods, mother goddesses, fertility deities, tricksters, storm-weather gods, creators, and warrior gods were ubiquitous in the ancient world. Baal and El reigned in Canaan until the Hebrew Yahweh replaced them. Hera and Zeus ruled the heavens in Greece until they were turned into mere statuary and literary characters by the Christian God. Many ancient deities still rule. Devi, Vishnu, and Shiva still dominate the temples and shrines of India. Spider Woman and the Great Spirit still have power in the sweat lodges, dances, *kivas*, and mountains of Native North America. Nigerian Binis have separated Mother Earth and Father Sky. The Japanese have their sun goddess Amaterasu, the ancestor of their emperors. There are gods who are said to have become incarnated as humans – Jesus as the Christ or Messiah, Lord Krishna; and the other avatars of the great god Vishnu; and some would say the Buddha.

There are many possible explanations for the concept of deity. A significant proportion of the human race argues that divinity first revealed itself to humanity in the form of personal beings. Others

have seen deities as metaphorical expressions, symbols of the mysteries of the universe, reflections of our sense of the numinous, and our sense of a realm of existence that is beyond the physical, beyond our understanding. For some, gods, being immortals, are the embodiment of our instinctive drive to establish a permanent order in the universe, of which we, as the allies or offspring of deities, can be a part. A universal theme reflected in the archetype that becomes our many versions of divinity is our need to feel that we are meaningful inhabitants of a meaningful universe that we are ultimately “parented” as cultures and as a species. In this sense, divinity is a metaphor for the furthest extension of which the human mind is capable at any given time. Not surprisingly, then, deities change with the times, taking ever new forms, even as the essential archetype remains constant, veiled in its eternal mystery.

A generally accepted truth of psychology, itself the source of one of the dominant myth systems of the modern era, is that we are what and who we are not only because of our genes but because of our “background” experience, an important part of which is our parenting. Creation myths are collective stories of parenting by deities. In these myths, our worlds, our cultures, and we ourselves were created by the original deities. When we are asked about these parents, there will inevitably be limitations on our actual knowledge but also, as the myths of psychology teach us, on what we are able to “face.” And, of course, our parents – actual and cosmic – are themselves the products of their own past. The understanding of deities and their role in our lives, like the memory and evaluation of parents, involves a complex process of delving into the past and overcoming strong forces of “denial.” It often means seeing our parents’ limitations and the inadequacies of our visions of them as well as their positive traits.

Deleuze and Guattari's Mystical Atheism

Amitabh Vikram Dwivedi
College of Humanities and Social Sciences –
Languages and Literature, Shri Mata Vaishno
Devi University, Katra, India

Introduction

A mystic can be a theist or atheist; however, non-believers, including agnostics, humanists, Taoists, and existentialists, have one more way to describe their nonbelief system, i.e., they may be called mystic atheists. A mystical atheist is a secular mystic who talks about non-dual awareness or consciousness, but who does not believe in a traditional creator God. According to Russell, the common features of mystical experience are real reality is one, timeless, and good. Many Hindu mystics claim that people's everyday perceptions are illusions and hallucinations, whereas the real perception is the direct experience of the identity of *Atman*, "soul." Eugene d'Aquili and Robert Newberg talk about the features of mystical experiences in terms of loss of perceptions, chiefly in terms of the passage of time, extension of space, distinction of the self and the external world, and distinction between objects in the external world. In Deleuzian theory, we find a preference for the material (heart) over the abstract (intelligence), further in praise of filmmaking he claims that it breaks the link between man and the world. Deleuze and Guattari, while commenting on experience, say that art is a sensation, but this sensation only works when it restores us to our constitutive infinity by creating the world anew.

Mystical Atheism: Deleuze and Guattari

On 24 January 1978, in a seminar session on Spinoza, Deleuze remarked on the possibility of knowing God as God knows himself. He called it a type of mystical atheist experience. When we know something as the thing itself, then we are aware of reality. Deleuze and Guattari describe the atheistic mysticism of a philosophy of immanence, the expression and construction by an abstract machine of a "local absolute." In *Cinema*, Deleuze writes that cinema can perform the liberating function of bringing thought face to face with its own impossibility. Further, he declares that the sensory-motor break makes man a seer who finds himself confronted by something unthinkable in thought.

So, mystical atheism is a real condition of Deleuze and Guattari's pragmatic philosophy. Unlike Nietzsche who claims that "God is dead," Deleuze and Guattari argue that the aim of Spinoza's ethics is to know God/Nature. Spinoza's God is a natural and immanent one who exists in expressions, unlike a transcendental one based on the traditional Christian concept of "Good" and "One." We can say that Spinoza's God/Nature is atheistic because its essence exists only in its expression. Deleuze argues that Spinoza's atheism is a condition of his radical emancipation.

Deleuze and Guattari claim that mystical experience of immanence of the construction/expression occurs on both the finite and infinite plane. This implies that mystical experience of immanence cannot be transcendental; therefore, it is necessarily atheistic. Mysticism is a physical practice of constructing one's body without organs. Also mystical atheism is a creative practice that is inseparable from affirmation. They write that the field of immanence or plane of consistency must be constructed: it is constructed piece by piece, and the places, conditions, and techniques are irreducible to one another.

Mystical atheism comes into being when someone expresses an infinite world in constructing a finite artwork; to make art, in other words, is a process by which the becoming of the world is expressed in a construction which works upon its own conditions, which operates at

the level of its constitutive mechanism. In Zepke's words, any construction of art then, any sensation, emerges through an abstract machine to express an infinite plane by way of an actual becoming whose very specificity and precision involve or infold a change in its real conditions. The world is this genetic plane of immanence, a Bergsonian multiplicity which is being expressed in a finite construction, an artwork, a sensation, changes in nature.

destroying everyone and everything in it except, in some cases, for a flood hero, who is sometimes accompanied by his family and representatives of various animal and plant species. These survivors live to populate a new world. The oldest extant version of the flood myth is that of ancient Mesopotamia, contained in the Gilgamesh epic. This is a version remarkably close to the biblical version contained in Genesis.

Perhaps the best way to understand the psychological significance of the flood myth is to suggest an analogy to the rite of baptism, or purification by water, as practiced by many people since early times. In baptism the individual is symbolically drowned by submersion in the water only to be "reborn" into a religious community as he or she emerges. The individual dies to the old life and is reborn into the new. The waters of baptism are analogous to the maternal primal waters of creation. In the flood, humanity is collectively baptized, as it were; we die to the old creation and are reborn, through the flood hero, into the new creation.

In another related sense, then, the flood ritual represents the ever-existing hope for a second chance, for a new beginning. The flood hero, whether the biblical Noah or the Sumerian/Babylonian Ziusudra/Utnapishtim, is the representative of that hope within us. Locked in the ark of survival, Noah is the collective psyche on its Dark Night of the Soul, moving through darkness to the ever hoped for renewal that is wholeness.

David A. Leeming
University of Connecticut, Storrs, CT, USA
Blanton-Peale Institute, New York, NY, USA

Flood myths are ubiquitous. They are found in Native American and African cultures, in ancient Greece and Egypt, in India, in Oceania, and in South America. More often than not, flood myths are outgrowths of creation myths. Typically, the creator is dissatisfied with creation, usually because of the sinfulness of humanity. In order to make a fresh start, the creator floods the world,

Delusion

Lorna Lees-Grossmann
Department of Psychosomatic Medicine,
Klinikum Rechts der Isar, Munich, Germany

Delusions can be defined in a general sense as a belief that is false. The more rigorous definition implies that the belief is the result of some sort of pathology and that it adheres broadly to the conditions laid out by Jaspers: certainty, incorrigibility, and the impossibility or falsity of its content. The belief must be held with absolute certainty; the holder must be unable to be swayed by any counterargument or evidence to the contrary, no matter how compelling the evidence; and the content of the belief must be such that it would be unbelievable under normal, non-pathological circumstances. Delusion is distinct from beliefs arising from disorders or trickery involving perception: delusional beliefs do not arise from incomplete or false perceptual information; rather perceptual information may be manipulated or interpreted to bolster the delusional belief.

Jaspers

The DSM-IV definition retains a broad similarity with Jaspers' criteria:

A false belief based on incorrect inference about external reality that is firmly sustained despite what almost everybody else believes and despite what constitutes incontrovertible and obvious proof or evidence to the contrary. The belief is not one ordinarily accepted by other members of the person's culture or subculture (e.g., it is not an article of religious faith).

In spite of this general definition's broad acceptance, counterexamples have been produced for all of these criteria, the most notable being labeled the Martha Mitchell effect: a belief may be labeled delusional because of its apparent falsity, although it may in fact be true. Martha Mitchell, wife of the attorney general at the time of Watergate, was

labeled delusional when she persisted in asserting that there was illegal activity going on inside the White House. The leaking of information from the White House later proved the truth of her claims.

Further to the Martha Mitchell effect is the impossibility of ascertaining the truth-value of some statements. Religious beliefs fall into the category of beliefs with no determinable truth-value. The distinction between ordinary religious beliefs and delusional beliefs with religious content is that of sharedness: a religious belief that is shared by many is not classifiable as delusional, whereas a similar belief held by one or a very small number of people may be thus classified.

Munro

Munro (1999) suggested a more rigorous series of criteria to separate delusions from false beliefs. A delusional belief is expressed and held with unusual conviction, and the holder is particularly unreceptive to contrary evidence. So far Munro is in line with Jaspers; however, the further criteria include a strong emotional investment in the belief, with a concomitant oversensitivity, suspicion, or hostility to questioning of or about the belief. Normal behavior and logic patterns are generally unaffected, except in areas of the believer's life that are affected by the delusion. The internal logic of the belief may be preserved, although the resulting behavior may be out of keeping with the normal social context.

There are some delusional beliefs that allow a person to continue their lives in a reasonably normal fashion. In the main, however, with the lack of universal agreement about what precisely constitutes a delusional belief, the key criteria used for psychiatric diagnosis are practical: a belief should be considered delusional if it is definitively bizarre; if it is held with excessive conviction, especially if the believer is not amenable to counterarguments against it; and if the belief causes distress to the holder. If a belief meets the criteria for a delusional belief and yet causes no distress or even improves the believer's

quality of life, then some psychiatrists would prefer to allow the belief to remain unexamined. As with Freud's categorization of religious belief, some untrue or unprovable beliefs are helpful to the believer, and their loss may cause further, unnecessary distress.

Demeter/Persephone

Mara Lynn Keller
California Institute of Integral Studies,
San Francisco, CA, USA

The ancient Greek *mythos* of Demeter and Kore-Persephone carries a universal human message, the redemptive power of enduring love, despite violation, suffering, or death. Today, women and men who turn to archetypal psychology or a devotional Goddess-practice for personal and social transformation are often looking for a sense of well-being that is bio-mystical, social, and cosmological in nature. The *mythos* of Demeter and Kore-Persephone depicts reunion with the Mother/mother as a crucial stage on the soul-journey to return to self, others, and a sense of being at home in the world and the cosmos. The fullest telling of their myth is found in the Homeric *Hymn to Demeter* from the Archaic Age (ca. 650–550 BCE; author unknown).

The Sacred Story of Mother and Daughter

The *mythos* of Demeter and Persephone relates how the Daughter is abducted by Ploutos (Hades) against her will to the Underworld, separating Daughter and Mother; the Mother searches with the help of Grandmother Hekate for her lost Daughter; the fasting Daughter longs to return to her Mother, while the fasting Mother grieves for her lost Daughter; the Maiden awakens sexually (pre-patriarchal version) and/or is sexually violated (patriarchal version); despite anger and overwhelming grief, the Mother never forsakes her desire to see her Daughter again and eventually wins her Daughter's return, because of the famine caused by the withdrawal of her fertile powers and the consequent loss of wealth for Father Zeus, king of the Olympian pantheon; Daughter and Mother are joyfully reunited; Persephone accepts womanhood and claims her own (Underworld) domain, accompanied by new powers in all three realms of Heaven, Earth, and the Underworld; the Mother overcomes her rage against the Gods and regains a gracious heart, along with the return of her powers of fertility, nurture, and regeneration, and the expansion of her honors among humans and the Olympian deities; and the wise grandmother Goddess Hekate becomes Persephone's devoted companion and servant-priestess. Demeter and Persephone restore their gifts of fertility to the Earth and give humans special rites, including the Eleusinian Mysteries, rites of fulfillment, so humans can once again be reconciled with the Two Goddesses, adopted into their divine family, and find joy in this life and hope for life beyond death (Foley 1994, p. 80; Keller 1988).

The merging and diverging lives of mother and daughter, the weaving, unraveling, and reweaving of female ties of love, are part of every woman's daily life. The personal and cultural suffering wrought by the daughter's loss of the mother and the mother's loss of the daughter is a tragedy explored in myth, and the myth and rituals of Demeter and Persephone offer ways for women to heal from the loss of the mother-daughter bond (Rich 1976, p. 273). The *return to the mother*

reaches to the deepest level of intra- and inter-human healing, for women and men who have experienced the rupture of this primal bond.

The sacred story of Demeter and Persephone also reflects the experience of a woman who has been violated by a man and by patriarchal collusion. The diminishment of the Goddess under patriarchal societies was reflected in the abduction/rape and suffering of both Mother and Daughter, for both Goddesses were subjected to rape in the patriarchalized variants of their myths that encoded the changeover from an earlier matristic epoch to the patriarchal epoch.

The women's liberation movements of the modern and postmodern eras have encouraged women not to hide their experiences of violation but to tell others the truth, and through this, to address the personal and collective problem of violence against women. This in turn provides common ground for opposing sexual and physical violence against women and children, civilian violence, and wars of aggression. The Demeter-Persephone myth calls for the nurturing and cherishing, not the violation or destruction of human beings. Feminist Jungian psychologist Kathie Carlson explores the deeply relational dynamics of the psychological archetypes of Demeter-Mother, Persephone-Daughter, and Hades-Death in the lives of women and men; and she offers multiple ways to transform psychological wounding (Carlson 1990, 1997).

Rites of the Thesmophoria, Lesser Mysteries, and Greater Mysteries

Rites honoring the Mother and Daughter Goddesses were celebrated across Greece at crucial points during the agricultural cycle, for invoking fertility of the Earth and seeds, for cultivation of the new green sprouts, and for the harvest. Their earliest known rites, the Thesmophoria, were for women only and called forth the fertile powers of Earth, women, and all nature. These were held in late autumn, just before the men's plowing of the fields and planting of the grain seeds, before the arrival of winter rains.

The Lesser Mysteries were Rites of Spring that celebrated the renewal of the new life-force in all plants, animals, and humans, especially the powers of procreation. They also served as rites of atonement in preparation for the Greater Mysteries in the autumn, also called the Eleusinian Mysteries.

The Eleusinian Mysteries were the most popular of all Greek religious festivals and celebrated the successful harvest each fall, along with the Mysteries of Sacred Marriage, Birth, Death and Rebirth. This panhellenic festival, celebrated each year at Athens and Eleusis, was open to all, male and female, young and old, slave and free. These rites endured for almost two thousand years, from probably the fifteenth century BCE until 396 CE, when all pagan celebrations were outlawed by the Byzantine emperor Theodosius I. For the best overview and images of the archaeological architecture and art connected with the Eleusinian Mysteries, see the work of Greek archaeologist and chief superintendent of excavations at Eleusis, Kalliope Papangeli (2002). For a detailed discussion of the rituals, see Carl Kerényi (1960), George Mylonas (1961), and Mara Lynn Keller (2009).

The Mysteries of Demeter and Persephone also celebrated Sacred Male Divinities and the Sacred Masculine principle in nature, including human males. Gods and men appear in the mythos of the Mother and Daughter Goddesses as divine consort – Iasion was Demeter's lover in Crete; as husband – Plouton was Persephone's husband in the Underworld; as son – Ploutos, Dionysos, and Iachkos; and as healer – Asklepios.

The Names of Demeter and Persephone Reflect Their Many Powers

Demeter and Kore-Persephone are the older and younger aspects of the Great Goddess conceived as One, as Two-in-One. This is reflected in their naming as *the Demeters* (*tas Demetres*) and *the Two Goddesses* (*too Theoo*).

Demeter is a multifaceted Great Goddess with cosmological as well as personal and political powers. The etymology of *Demeter* – is contested

but probably means both *Mother* and *Earth Mother*. *Demeter-Chthonia* – as Demeter was called in ancient Crete and Greece – was the Earth, above and below ground (*Chthonia* at first meant simply *in and of the Earth*). *Demeter-Oreia/Mountain Mother* connected Demeter of Greece to the Great Goddesses of Crete and Anatolia called *DA-MA-TE* and *Mater*.

As *Thesmophoros/Law-Bearer*, Demeter was the bearer of the laws of nature and the cosmos, good farming, procreation, and community. She was celebrated as *Bestower of Bright Fruits*, *Bestower of Seasons*, *Anesidora/Sender-up of Gifts*, *Thermasia/Warmth* (the heat of the Earth that brings forth new life), and *Chloe/Green Growth*. As *Demeter-Eileithyia*, she was the birth-giving Goddess; as *Kourotrophos*, she was the *Cherisher of Children*. As *Demeter-Phosphoros/Light-Bearer*, she shared her healing powers. *Demeter-Melania/Black Demeter*, in Phigalia of Arcadia, was blackly cloaked in mourning, while at Eleusis, Demeter was connected to the fertility of the black Earth. As *Demeter-Erinyes/Demeter-Fury*, Demeter was enraged at the rape of her Daughter (by Plouton) and of herself (by Poseidon). As *Demeter-Lousia*, she washed away her anger.

Some scholars see Demeter only as the Grain Mother and the grieving Mother of abducted Persephone, however, in addition to her procreative powers, Demeter also embodied political powers. As *Demeter-Amphictyony/Unifier*, she first united the Hellenic tribes into a confederacy in the early Archaic period, to provide mutual protection and assure peace among the Greeks. She was given political titles and invoked for oaths and treaties at many Greek cities. In Athens she was *Demeter-Boulaia/Demeter of the Council*. On the island of Cos, Demeter was believed to have the power to protect children and secure peace, and she was invoked as *Soteira, Savioress*.

Kore, the name of Demeter's child, means *Daughter* and *Girl* or *Maiden*. As *Persephone*, the Maiden Goddess represents the sexually awakening daughter who matures from girlhood into womanhood. Following her abduction, Persephone becomes the *Bride of Hades*. She in turn becomes a mother and is the “producer of

beautiful children” (Euripides *Orestes* 964). Persephone's power as *Midwife* implies that priestesses of Persephone helped women deliver their babies. As the revered *Queen of the Dead*, who could traverse all realms of Earth, Heaven, and the Underworld, Persephone was the shamanic guide who retrieved a lost soul, helped a person transit suffering, or guided the dying to their final place of rest (Sophocles *Antigone* 810–813; *Oedipus at Colonus* 1548). She shared her mother's powers as *Thesmophoros/Law-Bearer*; and like her mother, she was invoked as *Soteira, Savioress*.

Demeter and Persephone as dual Goddesses expressed the matrilineal bonds of women, sacred marriage, the birthing and nurturing of children, the fertility of Earth and all nature, the basis of a peaceful community in abundant food for all, and the cosmological rounds of the seasons of birth, growth, death, and regeneration.

Demons

Craig Stephenson
Le Presbytère, Mondion, France

The Middle English word “demon” derives from the medieval Latin *demon* and the Latin *daemon*, from the Greek *daimon* meaning “deity,” that is to say, a god or goddess. Inherent etymologically and historically in the English word is an ambiguous mixing of the ancient Greek notion of spiritual beings in addition to the gods and goddesses, not necessarily evil, with the postexilic Hebrew thought of harmful spiritual entities, the Persian

notion of conflict between light (Ahura Mazda) and dark (Angra Mainyu) forces, and the Synoptic Gospel accounts of Jesus exorcising evil spirits that had invaded human beings, causing mental and physical illnesses (e.g., Matthew 8:28, 12:22; Mark 5:1, 3:22; Luke 8:26, 11:14). The contemporary use of the English word “demon” is for the most part skewed negatively to suggest one of an army of negative supernatural entities under the leadership of the devil or Satan, despite attempts to reintroduce the more positive connotations of an attendant daimonic attendant spirit.

The Hebrew word *shedim* meaning “demons” inscribes a hierarchy of evil forces in Jewish religion. In the Talmud, the *mazzikim* or “harmful spirits” are governed by a king named Asmodeus and a queen called Agrat bat Mahalath with 10,000 demonic attendants. Some medieval commentators such as Maimonides and Menahem Meiri either ignore the Talmudic references to demons or read references to evil spirits allegorically as describing, for instance, a bedeviling and persistent melancholy. However, the medieval Kabbalistic movement further develops Jewish demonology, mapping a vast realm of demonic powers which parody the sacred. In Islamic tradition, maleficent entities such as *djinn*s, led by a Satan-like Iblis, test the faith of true believers; those who fall prey to such deceiving demons are treated in the Koran as liars and hypocrites. In similar ways, Buddhism describes demons functionally as forces that obstruct the achievement of nirvana. Hence, the Christian notion of demons as legion (i.e., “or we are many” is the demon’s name in Mark 5:9) but occupying a lesser position within a cosmological hierarchy of beings finds correspondences in other cultural contexts.

The relative subservient position of demons in these hierarchical cosmologies carries important implications for how we deal with the distress they cause. For example, investigating demon possession within the Karava caste community of Galle, Sri Lanka, anthropologist Bruce Kapferer (1983/1991) finds that Sinhalese demons occupy a less powerful place in the vertical hierarchy of being than deities and humans, but demons cause illness by creating the illusion

that they can tyrannize and thereby disorder human beings. Kapferer characterizes the demonic as “a false oppressive totalitarian world which refuses possibility” and a possessed Sinhalese person as fragmented, reduced, and alienated (suffering from *thanikama*, meaning “aloneness”). Through the ritual process of exorcism, the Sinhalese differentiate between demons and deities who also have the power of generating illusions, but only for some ultimately edifying purpose. Kapferer argues that Sinhalese exorcism publicly affirms the given cosmological structure and at the same time presents the suffering individual with an opening into the possible. On the one hand, *yaksabhuta cidyava* as “exorcism” literally denotes taking the demon out of the possessed patient and transferring it to the basket, from there to the exorcist, and finally to a cock as sacrificial scapegoat. On the other hand, *yaksabhuta vidyava* as “the science of spirits” enacts the diagnostic problem of differentiating demons from deities and addresses the suffering of the possessed individual by reordering what the demonic has disordered: “In the *vilakku pade* the dancers place torches at the demon palace, lighting it up and opening it to view. The demon palace is revealed in its full completed objective meaning as not just the place of demonic disorder, but also as the place in which the deity resides” (Kapferer 1983/1991, p. 281). Kapferer emphasizes that the Galle Sinhalese differentiate between demons and deities who both create illusion, but for different ends. Demons cannot be transformed or reconstituted at a higher level in the cosmic hierarchy; they can only intensify the chaos of lower-level orders of the cosmic whole. Sinhalese exorcists, as “scientists of spirits,” light up the demon palace and thereby alter the sufferers’ perceptions of their suffering, emphasizing not so much the exorcising of the tyrannical spirit as the placing of the demonic in context with the divine, illness in relationship to health, disorder with order.

Freud wrote a psychoanalytical interpretation of a historical case of demonic possession (1922). A Bavarian painter, Christoph Haitzmann, came to Mariazell near Vienna in 1677 to ask for deliverance from visions and convulsions caused by a pact with a devil which was coming to term after 9 years. This

case begins with the death of Haitzmann’s father and with the metamorphosis of his image into the demonic. In a series of paintings, Haitzmann portrayed his dead father that gradually transformed into a demon with breasts and holding an open book in his hand. Through the rites of exorcism, Haitzmann felt himself released from two pacts he said he had signed with his demon. In the end, however, he chose not to return to his work as a painter but to enter the monastic life. Freud reads the case as a neurotic evasion of the ambivalent image of God-the-Father in which Haitzmann unconsciously defended against feelings of abandonment and deprivation. Freud portrays Haitzmann as having avoided the necessary mourning of the natural father and interprets the selling of his soul as a neurotic attempt to recast himself as son and obedient subject to a nurturing father figure and to remain within the classic Oedipal complex rather than live his adult life bereft. By submitting himself through the pacts to the father-as-demon, Freud argues, Haitzmann employed a “feminine attitude” by which he neurotically preserved his threatened status as “son” for a period of 9 years. For Freud, Haitzmann’s demonological neurosis permitted him to continue to feel contained within the inferior status of vassal-like “subject” and “son,” even though at great psychological cost and with much suffering from convulsions, visions, and creative blocks, culminating after 9 years in a crisis and eventually a shift into another form of containment, the holy orders. Freud knew well medieval textbooks on witchcraft such as *Malleus Maleficarum* and wrote to Fliess about the correspondences he could see between a possessed demoniac and a hysterical patient, between an inquisitor/exorcist and an analyst and between demons and repressed affects. In terms of psychological economies, he theorized that maintaining neurotic solutions such as Haitzmann’s takes a terrible toll, repression stealing libido that would normally be accessible to the ego.

Furthermore, in “Mourning and Melancholia” (1917/1984), Freud describes how a bereaved ego “cannibalizes” and “incorporates” a lost object in order to deny its death. In healthy mourning, he argues, the ego needs to both internalize and eventually expel this incorporated object. In

melancholia, the ego finds itself destructively supplanted and ruled by this increasingly obstructing object with no possibility for change. Clearly, for Freud, Haitzmann incorporated and thereby resurrected the lost father, his ego suffering under a subsequent demonic tyranny for 9 years until he sought deliverance from his symptoms through exorcism. For these reasons, Freud considers Haitzmann's subsequent maneuver out of his subjugation and into the order of the brethren as perhaps progressive but still evasive, neurotic, and, by implication, diabolical, the neurotic splitting perpetuated by the decision to enter a cloistered order rather than to take up again his vocation as painter. Lacan would read this psychoanalytically as a failure to endure a confrontation with the Otherness of the "réel": "that before which the imaginary falters, that over which the symbolic stumbles, that which is refractory, resistant" (Lacan 1966/1989, pp. ix–x).

In a definition of demonism for the *Schweizer Lexikon*, Jung (1945a/1954) accounts for the phenomena of demonic possession by referring to his theory of complexes. At the same time, his definition introduces a collective component. For instance, he describes the demonomania of the Ursuline nuns at Loudun as an epidemic comparable to what he calls the "induced collective psychoses" of the twentieth century; as a result, any interpretation of an individual's suffering such as that of the Mother Superior Jeanne des Anges should take into account not only the possibility of trauma and the activation of repressed contents in the personal unconscious but also the effects of the collective unconscious. In other words, Jung would argue that Jeanne des Anges's demonological neurosis psychically infected the other Ursulines, polarized Loudun, and drew crowds from across Europe because her possession articulated not only a personal repressed conflict but a social dilemma in which the collective unconscious was active. Curiously, in his definition of demonism, Jung doesn't refer to evil or to his theory of the shadow, an inferior part of the individual personality and of the collective which, he would claim, can be integrated only in as much as it can be realized and suffered. Elsewhere, in

connection with evil, Jung argues that while conscious constructs tend towards ternary forms, natural totalities form fours, the implication being that any teleological movement towards wholeness would require the inclusion of a fourth element which consciousness is inclined to abhor or reject; so, he observes, "In the case of the religious triad the Fourth is obviously the devil, a metaphysical figure missing in the Trinity" (Jung 1973, Vol. 1, p. 412). Jung's short definition of demonism also doesn't explicitly mention his notion of a positive "daimon," but this is perhaps implied in his references to trance, shamanism, and spiritualism.

Freud and Jung were addressing not seventeenth-century but twentieth-century Western problems in which psychological disturbances manifested more in terms of organic illnesses than of gods and demons. In an essay written in 1945, Jung makes this comparison explicit:

Psychology has discovered where those demons, which in earlier ages dominated nature and man's destiny, are actually domiciled, and, what is more, that they are none the worse for enlightenment. On the contrary, they are as sprightly as ever, and their activity has even extended its scope so much that they can now get their own back on all the achievements of the human mind. We know today that in the unconscious of every individual there are instinctive propensities or psychic systems charged with considerable tension. When they are helped in one way or another to break through into consciousness, and the latter has no opportunity to intercept them in higher forms, they sweep everything before them like a torrent and turn men into creatures for whom the word 'beast' is still too good a name. They can then only be called 'devils'. To evoke such phenomena in the masses all that is needed is a few possessed persons, or only one. Possession, though old-fashioned, has by no means become obsolete; only the name has changed. Formerly they spoke of 'evil spirits,' now we call them 'neuroses' or 'unconscious complexes'. Here as everywhere the name makes no difference. The fact remains that a small unconscious cause is enough to wreck a man's fate, to shatter a family, and to continue working down the generations like the curse of the Atrides. If this unconscious disposition should happen to be one which is common to the great majority of the nation, then a single one of these complex-ridden individuals, who at the same time sets himself up as a megaphone, is enough to precipitate a catastrophe. (Jung 1945b/1954, par. 1374)

Jung's use of the words "primitive" and "primordial" to account for the phenomena of demons leaves him vulnerable to charges of primitivism when he discusses other cultures, but here he applies the words to twentieth-century Western European culture in order to contradict its rational bias:

I use the term 'primitive' in the sense of 'primordial' and... I do not imply any kind of value judgment. Also when I speak of a 'vestige' of a primitive state, I do not necessarily mean that this state will sooner or later come to an end. On the contrary, I see no reason why it should not endure as long as humanity lasts. So far, at any rate, it has not changed very much, and with the World War and its aftermath there has even been a considerable increase in its strength. I am therefore inclined to think that autonomous complexes are among the normal phenomena of life and that they make up the structure of the unconscious psyche. (Jung 1934/1960, para. 218)

Clearly, Jung locates his definition of demonism in the present tense and in parallel with contemporary events.

Depression

Kate M. Loewenthal

Department of Psychology, Royal Holloway, University of London, Egham, Surrey, UK

What is depression? How is it seen by psychological, psychiatric, and religious authors? How is it related to religion and religious factors?

What Is Depression?

Depression is a term referring to a disabling and prevalent psychiatric illness: major depressive disorder (unipolar depression). But the term also refers to a number of other related states. Unipolar depression must be distinguished from (1) depressed mood, which is a normal emotional response to adversity, especially involving loss, which if transient is not considered a clinical problem; (2) bipolar disorder, a relatively uncommon psychiatric condition involving uncontrollable swings from elated manic phases to low, depressive phases; and (3) dysthymic disorder, a milder disorder involving the symptoms of clinical depression, but as few as two such symptoms (plus depressed mood) qualify the sufferer for the label dysthymic. There are a number of varieties of major depressive disorder and dysthymia, for example, seasonal disorder. Further, in clinical research, the term depression is sometimes used

to refer to a measured dimension, varying in the number and sometimes intensity of the symptoms of depression.

Returning to the commonest meaning of the term depression, major depressive disorder is considered present (American Psychiatric Association 2014) if at least five of the following have persisted for at least 2 weeks, of which at least one is depressed mood or loss of interest or pleasure:

1. Depressed mood most of the day, every or nearly every day
2. Diminished interest or pleasure in all or nearly all activities
3. Significant weight loss or gain
4. Insomnia or hypersomnia
5. Psychomotor agitation or retardation
6. Fatigue or loss of energy
7. Feelings of worthlessness or excessive or inappropriate guilt
8. Difficulty in thinking or concentration or indecisiveness
9. Recurrent thoughts of death or suicide or suicide attempt

Although there may be some biological predisposition, the most popular view of the causes of depression involves a diathesis model, in which a causal event or difficulty involving loss precipitates depressed mood, which can become a clinical condition in individuals who are vulnerable. Vulnerability factors may include early experience of loss (such as death of a parent), inadequate social support, low self-esteem, and heavy caring responsibilities, and there is some evidence of cultural variation in the factors that make people vulnerable to or protect them from depression (Brown and Harris 1978; Butcher et al. 2012; Loewenthal 2007). Widely used treatments include medication and psychotherapy, for example, cognitive behavioral therapy. It is worth noting that of all psychiatric conditions, depression has perhaps excited the most controversy. It has been a prime target for the antipsychiatry movement, led by Szasz (1974), arguing that it cannot be regarded as an illness, though it involves great suffering. Szasz argues that the illness model of

mental illness leads to medication, custodial care, and other treatments being wrongfully and coercively applied. In spite of Szasz, the view of (clinical) depression as illness remains significant.

This entry will look at views of depression in religious sources and some of the effects of these views. This entry will consider the widely cited claim that religious people are less prone to suffer from depression and will consider the factors, which may be involved in this effect. Finally, we will consider recent attempts to deploy religious and spiritual factors in the therapeutic process.

How Has Depression Been Viewed in Religious Sources? What Are the Effects of These Views?

In religious writings, it has been suggested that melancholy may be a spiritually valued, possibly chosen state (see Frost 1992), and even if not chosen, depression and melancholy may be viewed as opportunities for spiritual growth, increasing religious trust (Loewenthal 1992). Dura Vila (2017) has argued that certainly among the religious professions, the dark night of the soul is regarded as a springboard for growth and is not appropriately seen as an illness in need of therapy and medication. Much recent work in positive psychology has offered evidence in support of these pious hopes: posttraumatic spiritual growth has now been empirically affirmed as a possibility. Thus, Shaw et al. (2005) concluded that religion and spirituality are usually, although not always, beneficial to people in dealing with the aftermath of trauma. Traumatic experiences can lead to a deepening of religion or spirituality, and positive religious coping, religious openness, readiness to face existential questions, religious participation, and intrinsic religiousness are typically associated with posttraumatic growth. Positive psychology in general has been advanced as effective in the treatment of depression and as harmonious with a number of core religious teachings and spiritual values, such as the practices of helping and of forgiveness (Joseph et al. 2006; Seligman 2002). Such religiously encouraged

practices are reported to have beneficial mental health effects.

Although in religious writings melancholy and depression have been generally viewed as normal responses to adversity and loss and as foundations for a deeper faith, lay religious persons may regard depression as a failure of religious faith (Cinnirella and Loewenthal 1999). For example, *Sometimes we assume that depression can always be overcome through prayer – that good Christians don't suffer from depression* (quoted in Schroedel 2008). Webb et al. (2008) report that views of depression as a personal religious failure can be found in some Christian self-help books. Greenberg and Witztum (2001) quote several rabbinic leaders who suggest that prayer, religious song, and other religious coping methods may be sufficient. Indeed they may be in some cases, but where they are not, the cloud of depression thickens. In spite of the frequent helpfulness of religious ideas in coping with the miserable psychological consequences of adversity, religious coping may not always do the trick, and there is an ongoing concern that when religious coping fails, this may be seen as a personal failure, inadequacy of the individual, leading to deeper depression.

It is also important to note that clergy are often trusted as resources for mental health care, generally more so (by their congregations) than the mental health professions. Thus, religious teachings about depression and coping, as delivered by the clergyperson, may be an important resource. A minority of clergy may actively mistrust the mental health professions and warn their congregants against the use of professional help (Leavey et al. 2007). A further barrier to professional help seeking is the stigmatization of depression and other mental illnesses, said to be marked in religious communities (e.g., Crosby and Bossley 2012; Rosen et al. 2008).

Religious teachings on depression have been mixed and have had mixed effects – depression itself may have some spiritual value as a springboard for spiritual growth, religious faith, and religious practices – and religious leadership may be helpful in coping with depression. However, the failure of religious coping can have a

damaging effect on a person who is already depressed, and the advice of the minority of religious leaders to avoid professional mental health practitioners may not always be in the best interests of those suffering from depression.

The Association Between Religiosity and Low Levels of Depression

It has been widely concluded that there is an overall, consistent relationship between indices of religiousness and lower levels of depression (Koenig et al. 2012; Loewenthal 2007; Worthington et al. 1996). In spite of inconsistencies in the assessment of religiosity and of depression, the relationship is fairly reliable, though not strong and not always consistent. What are the factors involved? Three kinds of effects have been identified:

1. *Social support*: religious groups endorse and encourage helping in times of adversity. This includes in-group as well as out-group helping (Inaba and Loewenthal 2008). Additionally, the existence of a social circle of friends and sympathetic listeners can be an important protective factor. Thus, Shams and Jackson (1993) found that unemployed Muslim men in the north of England were less likely to become depressed if they were religiously active, meeting regularly in the mosque for friendship and support, as well as prayer and religious study. Brown et al. (2005) concluded that social support is an important factor enabling the improved adjustment associated with spirituality and religion.
2. *Religious coping*: religiously active people are likely to engage in religious worship, study, and prayer, and this will develop a repertoire of religiously based coping beliefs which are drawn on in adversity, such as “this is all for the best,” “I feel that G-d is supporting me,” and “there must be a reason for this even if I can't see it now” (Loewenthal et al. 2000). The study of religious coping has been effectively established by Pargament (1997), who has reported a number of robust effects.

Particularly important is the effect that good psychiatric outcomes (in adversity) are associated with positive religious coping beliefs, such as those listed above. Poor psychiatric outcomes are associated with negative coping beliefs, such as “G-d is punishing me (because I am bad),” “There is no purpose in this,” and “G-d has abandoned me” (Pargament et al. 2003).

3. *Lifestyle factors*: religions endorse and encourage aspects of lifestyle which can have an important impact on well-being. Thus, for instance, religious Jews and Christians have been shown to report fewer disruptive life events – particularly, they report fewer family-related disruptions, less arguments, family violence, and divorces. Disruptive life events are strongly associated with the onset of depression, and thus, the lower prevalence of depression in the religious groups studied may be (at least partly) traced back to the religiously supported value placed on harmonious family life and marital stability (Loewenthal et al. 1997; Prudo et al. 1984).

The finding that religious coping can have an impact on clinical outcome – sometimes positive and sometimes negative – has led to the development of exciting attempts to bring spiritual and religious factors into stronger focus in the course of psychotherapy. After many years in which religion and spirituality have been excluded from the psychological therapies, Pargament and his colleagues (among others) have introduced a wide range of suggestions about how religious and spiritual factors may be included (Cook et al. 2009; Pargament 2007, 2013). Spirituality – defined as *the search for the sacred* – is central for many clients in psychotherapy, and therapists need the tools and the sensitivity to address the spiritual dimension in a systematic way. Spiritual coping may be used to conserve, protect, and develop the sacred; it may lead to growth, it may lead to decline, it may be part of the solution, and it may be part of the problem. For example, one woman was in despair because she felt she had committed an unforgivable sin. The therapist was able to liaise with the client’s

priest, and the priest, therapist, and client were able to develop a successful reconciliation. A strong merit of the work led by Pargament is the emphasis on an evidence base for findings, which may do much to enhance the scientific acceptability of clinical work involving spiritual and religious factors.

This entry has defined depression, considering how it has been viewed in religious writings, and considering some of the ways in which it may be affected by religious factors and, finally, the ways in which religious and spiritual factors have been brought to bear in therapeutic work.

Depth Psychology and Spirituality

Lionel Corbett

Pacifica Graduate Institute, Carpinteria, CA, USA

Introduction: A Spiritual Approach to Depth Psychology

For many depth psychologists with a spiritual orientation, psychology and spirituality are two perspectives on an identical reality, because the divine manifests itself by means of the psyche. Dourley (1981) has pointed out that the psyche is sacramental, since it is a medium of connection to the sacred and it has its own transpersonal dimensions which reveal the sacred or the holy. The depth psychological approach to spirituality appeals to direct, personal experience of this level of reality and eschews reliance on doctrine, dogma, religious tradition, or religious authority.

This approach claims that the personal and transpersonal dimensions of the psyche are inextricably intertwined, so that when we study sacred experience we invariably study the structure and dynamics of the psyche at the same time. Similarly, transpersonal elements are invariably present even in what seems to be purely personal material and even if we are unaware of them. Therefore, to separate spirituality and psychology is largely a convention based on habit, cultural preference, and academic turf. Here I make the usual distinction between religion as an institution with prescribed beliefs and practices and

spirituality in the sense of a subjective relationship with the sacred or with the divine in a traditional sense. Or, based on our personal experience of the transpersonal dimension, our spirituality is our acknowledgment of spiritual forces at work beyond human understanding or simply our personal way of dealing with life's ultimate questions.

Soul in Depth Psychology

From antiquity until the early nineteenth century and the subsequent rise of psychology as an academic discipline, what we now call psychology was understood to be a science of the soul. This is again the attitude of many contemporary depth psychologists. Although there is no agreement on the meaning of "soul" in their literature, for many depth psychologists, the words "soul" and "psyche" are roughly synonymous terms. Psychotherapy, for instance, is understood in the etymological sense of that word as service to the soul. Most of these psychologists agree that whatever might be the nature of the psyche or the soul, it can be thought of operationally as an ontologically *a priori*, spiritual essence within the person, not necessarily in the traditional theological sense but as the deepest subjectivity of the individual, that level within us that gives meaning and significance to our lives.

Most depth psychologists would object to attempts to reduce the psyche or soul to an epiphenomenon of the brain, because, as Jung (1964/1970) puts it, we assume that the psyche is a domain of existence in its own right, indeed a cosmic principle coequal with physical being, and that the psyche arises from an unknown spiritual principle (1960/1969). Indeed, many depth psychologists believe that spiritual reality contains and organizes what we refer to as material reality. One has to address in one's own way the potential problem of dualism that arises here. One can for example simply bracket the traditional soul-body or mind-brain dilemma for practical psychotherapeutic purposes, or one can think of these as two aspects of the same reality, experienced in different modes because of the

limitations of the human perceptual apparatus. One can use a personally appealing metaphor to avoid dualism, for example, by thinking of psyche and body as a gradient of different densities of emanation from a unitary source. The physical body is at one end of this spectrum, while consciousness is at a more subtle level of the same energetic process.

Archetypes as Spiritual Processes

The depth psychological approach to spirituality views the psyche's intrinsic organizing principles, what Jung called the archetypes, as spiritual principles within the psyche. This allows depth psychologists to see archetypal processes as spiritual "organs" within the psyche that perform different functions, just as, in antiquity, these forces were personified and thought of as gods, goddesses, or spirits. Archetypal patterns contribute to the structure of the individual psyche because they form the core of intrapsychic structures or complexes, so that there is always a transpersonal aspect to our psychological life, including our psychopathology. That is, spiritual elements are important in forming the structures of the personality, so that to study these structures psychologically is at the same time to study the dynamics of the sacred within the personality. Thus, rather than envision the transpersonal dimension as entirely transcendent, for the depth psychologist, it is located deeply within human subjectivity. Traditional theologians are concerned that this perspective reduces a supra-psychic divinity to a purely psychological phenomenon. However, if the psyche is real and the holy manifests itself thereby, no reduction is implied.

The Religious Function of the Psyche

Because of the psyche's intrinsic religious function, which means its ability to either generate or mediate numinous experience, the psyche is a continuous source of personal revelation. Many traditional religionists believe that revelation is restricted to events such as the handing down of

the Torah at Mt. Sinai or by means of the life of Jesus. For Christian fundamentalists, revelation ended with the completion of the New Testament. In contrast, the depth psychologist believes that numinous or mystical experiences as described by Rudolph Otto (1958) continue to occur to all of us in dreams, as waking visions, through the body, as synchronistic events, in the natural world, during creative work, during periods of physical illness or psychopathology, induced by entheogens, or spontaneously for no apparent reason (Corbett 1996, 2007). Typically, the eruption of the numinosum into ordinary consciousness is more likely to occur when the hegemony of the ego is relatively weakened by severe stresses.

Experiences of the *mysterium tremendum et fascinans* may or may not take a traditional form. Biblical examples are the experience of Moses hearing the voice of God speaking to him from a burning bush (Exodus 3: 2–6) or the experience of Saul on the road to Damascus, blinded by a bright light as the voice of Jesus speaks to him (Acts 9: 1–9). However, numinous experiences may be completely novel and may not be related to the religious tradition of the subject, in which case their content may be difficult to understand, even though their emotional quality is unmistakable. Even when they do not have a traditional content, they are recognized by their emotional quality; they are awesome, dreadful, and uncanny, making one feel that one has been addressed by something not of our ordinary world. Often we feel humbled, captivated, perhaps blessed by them.

Of most importance to the depth psychologist is that numinous experiences are usually intimately related to the psychology of the subject, which is why Jung stressed their healing quality. Sometimes they address the subject's immediate existential problem, while at others they speak to a developmental difficulty, an emotional problem, or they affect the course of the individual's individuation process. They may produce a religious conversion experience or prevent suicide, although it is important to note that in fragile personalities they may trigger a psychosis or a "spiritual emergency."

Because of their emotional intensity, numinous experiences have a self-authenticating quality; they produce a subjective conviction of their ontological reality that is difficult to deny. Nevertheless, for the materialist, whether psychoanalytically or biologically oriented, such experiences are typically reduced to some form of psychopathology by dismissing them as hallucinatory, hysterical, the result of residual primary narcissism, a regressive merger with mother, or due to a pathological brain process. In contrast, for the depth psychologist, as for Rudolph Otto, these experiences are *sui generis*, and not reducible. For the depth psychologist, they can be considered to be the experience of direct contact with the archetypal dimension of the psyche. Either they originate in what we refer to as the unconscious or the unconscious acts as a medium of transmission of the numinosum which originates "beyond" the psyche. This epistemological problem cannot be definitively solved, but it is not important for practical psychotherapeutic work, which requires that we discern the significance of the experience for the subject's life, relate it to the subject's psychological structures, and assist with its integration if necessary.

Spirituality as an Integral Aspect of Human Psychology

There is evidence (from burial practices, cave paintings, stone monuments, and the shamanic traditions) that our early human ancestors practiced various forms of spirituality for tens of thousands of years prior to the advent of the monotheistic traditions. Obviously there are several ways to interpret this fact. There are "explanations" for the origin of religion from all schools of psychology, while biologists believe that spirituality developed with the evolution of brain structure, although there is disagreement about whether religious belief was directly adaptive or whether religion is just a by-product of our evolution. However, to have a scientific explanation for a phenomenon does not mean it is not real. The psychologist can legitimately argue that human beings have a spiritual sensibility because there

really is a spiritual dimension and we are drawn to it because it is an essential level of our being, just as thirst would not have evolved if we did not need water.

If spiritual experience is the experience of something both real and important to us, and our spiritual sense is a source of human motivation, spirituality is properly part of the province of psychology. It may be argued that for the depth psychologist, to study spiritual experience smacks of an encroachment on theology. But this would only be the case if we were to speculate on the origin of this experience or on its absolute nature, whereas we simply accept this genre of experience as an empirical reality. Its source – for example, whether it may originate in a divinity beyond the psyche – remains a matter of faith.

The depth psychological approach suggests that we have no need to tie our spirituality to any particular religious tradition. The established religious traditions have long insisted that the sacred may only be approached in their terms, using their rituals, sacraments, sacred books, and so on. However, many people experience the sacred in personal ways that may have little to do with the ways in which our religious traditions insist that it manifests itself. Our contemporary consciousness, influenced by advances in quantum physics, cosmology, and depth psychology, requires that we approach the sacred with these developments in mind.

Edinger (1984) has suggested that our culture is beginning to experience a new dispensation, a new means by which divine grace emerges into the world, and a new God image. The ancient Hebrews experienced the divine handing down law cast in stone, followed by the Christian experience of Christ as the incarnation of the God of love. Our felt sense today is that we are in relationship with the transpersonal psyche, which incarnates in everyone and communicates through personal experience of the numinosum rather than by means of a set of laws or a particular savior. It is too early to tell if Edinger is correct, but if he is, the depth psychological approach to spirituality will be one of the pillars of this emerging spiritual form.

Descent to the Underworld

Kathryn Madden
National Institute for the Psychotherapies,
New York, NY, USA

In Christian theological doctrine, Christians affirm in the Apostles' Creed their belief that Jesus descended into Hell (Gk. κατελθόντα ες τὰ κατώτατα; L., *descendit ad inferos*, or underworld), on the Saturday between the Crucifixion and the Resurrection. His descent is understood as an act of liberation of the unredeemed souls who had been banished to Hell from the beginning of

time. It is believed by most Christians that Christ raised with him those from all previous times who were deemed by God to be worthy to enter the kingdom of eternal life. Although this declaration of faith is made in the Christian Apostles' Creed, there is no specific mention of the event in the gospels other than some inferences in Acts 2:24:

But God raised him up having freed him from death, because it was impossible for him to be held in its power.

Acts 2:31 further states that:

He was not abandoned to Hades, nor did his flesh experience corruption (The New Oxford Annotated Bible 1991).

John 2:6 describes Jesus' death as three days and three nights in the heart (*en te kardia*) of the earth. The apostle Paul draws in Romans from Deuteronomy 30:12–13 and Psalm 71:20 to describe the death of Jesus as a plummet into the abyss (*tis katabesetai eis abusson*) and the ascent of the Resurrection as a rising from the dead (*ek nekron anagein*). As forecast in the Old Testament, Hebrews (2:14–16), Jesus was to encounter the actuality of death as the only course by which his divine being could conquer evil.

In the Jewish tradition, beginning with the early Hebrew peoples, Hell was referred to Sheol [sh'ôl], the common place of the dead. Sheol was an underground abode comprised of numerous levels. The dead were tortured according to the degree of their earthly sins. There below was also Gehenna, the lake of eternal fire where the fallen were forever tormented by flames.

The theme of human descent to the underworld does not exist in the Old Testament except in how God rescued people from death (Psalm 9:13; 30:3; 86:13; Isa 38:17; Deut 32:39; 1 Sam 2:6; 2 Kings 5:7). For example, when Saul summoned the prophet Samuel through the witch of Endor to consult the dead (1 Sam 28:3–25), there is an indication of bridging the realm of life and death. In general, the notion of human descent was censured by Old Testament Law. In modern Judaism, an increasing distinction arose between the place in which the unrighteous dead dwelled (Hades) and a separate place in which the righteous dead resided (Luke, 16:22–23).

The late Hebrew literature of the apocryphal texts contributed to how the notion of descent was conceptualized in the Apostles' Creed. These included the apocryphal *Gospel of Nicodemus* and *the Acts of Pilate* (ca. 3 CE). The *Gospel of Nicodemus* prophesized that Jesus would raise the dead in Hell just as he had raised Lazarus. Apocryphal literature often referred to the *Descensus Christi ad Inferos* which portrayed a conflagration between Christ and Satan, the god Hades.

In the second and third centuries, the early church fathers Tertullian, Clement, and Origen treated Christ's descent as literal. Their authoritative testimony anchored the event in Christian belief although it was not entered in to the content of the Apostles' Creed until around the seventh century.

The concept of the descent to the underworld derived from numerous oral traditions, legends, and literary forms borrowed from antiquity, which undoubtedly influenced the writers and redactors of scriptural literature. The myths recorded by Homer, Hesiod, Aristophanes, and Virgil featured a protagonist's heroic return from the underworld that involved transforming evil into good, death into life, and torment into faith in relation to a salvific figure. Many of these legends became living religions lasting thousands of years.

In the literature of ancient Egypt, Hades, or Amenti, pertained to the place of the hidden god. The Egyptian *Book of the Dead* attests to specific rites and rituals in which an initiate would venture into the underworld with the goal of transformed consciousness. The Egyptian rituals inspired the Greek Mysteries, Eleusinian Mysteries, and Mithraism, which were liturgies of symbolic death and rebirth that emulated the earlier worship of Osiris. The discourse in Colossians 2:9–15 of the New Testament pertaining to *The Lord's Descent into Hell* may imitate these earlier traditions. The ritual of baptism became representative of symbolic death and rebirth.

In ancient Greece Hades [Gk. unknown, unseen, hidden] became known in various cultures as Gehenna, Tophet, Abaddon, Naraka, Jahannam [Hind.], Aralu [Babylonian], Hel, Nuifhel [Norse], the inferno, the pit, the abyss, the nether world, the region of the dead, the abode

of the damned, the place of torment, visitation with the shades (ancestors) below, or limbo, the realm of departed souls. The descent typically involved a confrontation or encounter with the god who ruled the terrain of the underworld.

One of the most celebrated initiates connected to the Greek Eleusinian Mysteries (seventh century BCE) was Persephone, the daughter of Demeter who was seized by the god Hades and taken into the underworld. The myth of Persephone and Demeter remained in the collective culture as a religion for over 2,000 years.

Another descent myth of the Greek Mysteries was the Orphic Mystery. Orpheus had a beautiful wife, Eurydice [Εὐρύδικη, Ερδίκη], as well as a talent for playing the lyre. One day while dancing in the fields, Eurydice was bitten by a poisonous snake and died. Orpheus ventured to the underworld in an attempt to bring her back to human life. One version of this legend tells of Orpheus playing his lyre so enchantingly that Cerberus, the sentry of Hades, fell asleep. Orpheus then entreated the god Hades to return the soul of Eurydice to life. His wish was granted with the qualification that Orpheus must walk ahead of his wife and never look back until they had returned to the world of the living. Orpheus failed. He was never to see his beloved wife again (Guthrie 1993, p. 171 ff.).

Christ's descent into Hell and subsequent Resurrection corresponded with the rituals and themes of these ancient civilizations. In early cultures, the triumph over death often coincided with the harvesting seasons of the agricultural year. The Greeks understood Hades as fork in the road where one might enter *Tartaros* (an existence of endless punishments) or, at best, one could be ushered into a paradisaical existence where their loved ones awaited – the Elysian Fields.

Until approximately 500 CE, the descent ritual was an inherent part of a sect of secret teachings known as the Greek Mysteries. The initiate's descent was both symbolic and literal. One was isolated in an underground cave or hollow in order to confront an internal universe. Analogous to modern analytical psychology, the symbolic quest, like C. G. Jung's mid-life challenge, was a

telos (Gk. *telete*), an end goal and ultimate completion of one's potential for psychological and spiritual development.

In every culture of ancient civilization, the collective psyche gave birth to initiates who made the descent and were magnified into the heroes of myth, for example, Gilgamesh, hero of the Babylonian epic; Ishtar who descended into Aralu; the goddess Astarte of Phoenicia and her consort Adonai who journeyed into the Akkadian Hades; and the Great Mother Cybele of Asia Minor with her consort Attis. Others included Dionysos, Herakles, and Krishna.

A consort, guide, master teacher, high priest, or priestess prepared the initiate for the journey, similar to the modern role of the psychotherapist where one descends into his or her unconscious, internal world and is accompanied by the presence of a therapist. The role of this consort was also to warn an initiate about the possible disintegration of the personality during the process and potential madness upon return.

There was an emphasis upon preparation for "going deeper" and a series of pretrials to pass successfully including fasts and purification rites. One needed a strong constitution, a sturdy ego, and a maturity of character. The initiate was trained to relinquish memory, desire, and will so that the physical self and personal psyche could succumb to a temporary deathlike state (Apuleius 1984, *Metamorphoses*, XI, 21, 23) which was often described as darkness. Plutarch, too, underwent an initiation ritual describing the proximity of *teleutan* and *teleisthai* – *to die* and *to be initiated* – (Plutarch 1987, *Fragments*: 178). In the depth of this slumber, the mysteries of life and death might also be revealed. In the Egyptian Mysteries, Apuleius exclaims this experience of illumination: "at midnight I saw the sun shining with a splendid light" (Plutarch 1987, *Fragments*: 23).

If not sufficiently prepared, the participant could experience a threshold of annihilation. Face to face with the god of the underworld – what in modern psychology C. G. Jung would call an encounter with the archetypal shadow – the individual only could endure only with the qualities of humility and willingness. If the seeker was able to make it beyond the more dangerous

stages, the reward was a beyond death experience of immortality.

The Egyptian myths, the Mystery Religions, and the apocryphal texts of Early Christianity were sources for accounts that followed throughout the centuries in various genres, for example, the English Mystery Plays of medieval times, which centered on the theme of the Harrowing of Hell and of Dante's *Inferno* (Canto X. Circle vi).

Inspired by Virgil's *Aeneid*, philosopher Dante Alighieri wrote about the descent into Hell in "The Inferno" from his *Purgatorio*. In this work he speaks of the lowest Hell replete with "malicious and furious demons" as the City of Dis. Dis is the most abyssal abyss of ultimate despondency. This underworld represents the bowels of the universe and the bleakest recesses from anything alive or life-giving. In Dis, there is no promise of hope or of a caring and sustaining divinity, only evil and despair.

As represented in Dante's illustration of unconscious life, those who reside in the darkness of Hell are forever alive, yet spiritually dead. What greater cruelty to human consciousness and to the uniqueness of an individual than to be completely unknown, and unconscious. In the abyss of Dis, there is no possibility of the life of the soul without the redemption of another. For Dante, at the end of time, the forgotten non-souls who have not "known" Christ are lost forever to the possibility of being known within the unity of the divinity. These are individuals who have turned their focus toward the sterility of selfish egotism in contrast to offering gratitude for their very being. Control, power, greed, and envy relinquish them to an eternal Hell of nonbeing.

Psychology

Analogous to the Nekyia, or night sea journey of Carl Jung, the descent into the underworld has powerful and purposeful psychological intent. The ego falls into the unconscious for an extended time to eventually emerge as a person reborn. The transformed individual seeks to "obey a higher will."

Jungian analyst Edward Edinger concurs that this "fall" or plunge into the psyche represents the ego's intentional descent into the unconscious because the ego has been "beckoned." The awareness of the conscious ego is, in the interim, eclipsed and carried into the lower world where it rescues certain contents of the unconscious and even conquers death itself. For Edinger, the death and Resurrection of Christ is an archetype that exists in the collective psyche that is analogous to the process which lives itself out in the individual seeker (initiate). The collective God image must necessarily undergo death and rebirth throughout certain periods of history; he tells us, thus, the continuing necessity of willing initiates to bring forth "the godhead."

Jung views this prolonged "disintegrative" encounter as the psychological equivalent of the integration of the collective unconscious, which is "an essential part of the individuation process" (Brome 1981, p. 159). The unconscious underworld needs ego consciousness to raise it (Brome 1981, p. 39). What Dante called Dis represents all that is yet unknown to human consciousness. Dangerous components of the shadow aspects of human consciousness exist externally and dangerously so, as long as the projective nature of the psyche remains shut away within the crypt of the individual and collective psyche.

Drawing from anthropologist and scholar Mircea Eliade, Marie Louise von Franz (1975) likens Jung to the shaman whose "main function is the healing of personal illnesses and disturbances in the life of the collective" (Eliade 1964, 8 passim). Like the shaman or medicine man, certain individuals are forced into a particular inner way as a result of the collective culture around them. As the person feels summoned, "he sets himself apart, turns contemplative; often he receives his call through a dream experience" (Eliade 1964, p. 21). Readiness is crucial to survive the dying of the old self, the former ego, and the emergence of a new self.

The individual is carried off to the underworld where he or she is often dismembered or suffers other tortures. Like the duel possibility of the Greek path of the underworld, one may also be

carried off to heaven where instruction is received from a divinity, a female figure, an invisible heavenly spouse, or a magical anima (von Franz 1975, p. 100). The central element is always the same: death and symbolic Resurrection (Eliade 1964, p. 5, 56).

Contemporary Jungian analyst James Hillman agrees with Jung in *The Dream and the Underworld* (Hillman 1979) that it is Psyche who beckons us into the depths. Being polytheistic in contrast to monotheistic, Hillman is more synchronous with the worldview of antiquity: there are many gods and goddesses in the psyche personified as archetypal manifestations, but there is not necessarily anything divine or transcendent beyond the psyche. Spirit reveals itself in image from the depths of the soul, which Jung, Edinger, Dante, and the masters of the mysteries would agree with. Yet, for Hillman and the Greeks, images *are* the divinity.

In contrast to Jung, Freud's classical perspective views images, dreams, or waking dreams of descent into the underworld, as Oedipal themes related to castration anxiety. Freud emphasizes incestuous content with the repeated theme of the psyche's need to destroy phallic symbols (Boss 1973, p. 273). For instance, a patient might dream of a church tower, an image that dream by dream becomes more differentiated. A Freudian psychoanalyst working with such a dream most likely will interpret reductively the increasing specificity of the church tower as a collection of images that relate back in the patient's developmental life. The image becomes reduced to that of genitalia or "to a preconceived unconscious complex, thus paying a disservice to the spirit" (Robbins 2008).

What is crucial when working with the deeper layers of the psyche (the underworld), the patient, with the analyst's guidance, will begin to amplify dream images in a non-pathological manner, giving the individual the opportunity to dig more archeologically into the collective underpinnings of the psyche at large, which often not only produces religious or spiritual images but a feeling of confidence that one is connected to very deep roots with a suprapersonal divinity. One discovers that religious dreams and symbols have their fundamental origin in archetypal structures that are

universal, timeless, and shared in common with all people.

Regardless of the psychological school of thought, the chthonic and instinctual of a psychological complex need to be given as much primacy as the spiritual and transcendent, therefore avoiding abstractions or overintellectualizations. A Jungian perspective can lean too far toward "spirit," with a tendency to universalize a patient's imagery. This inclination can be reductive in if there is an essentialism underlying the image.

A balanced discernment means that one truly descends into the depths of "pathos," or one's pathology, and yet does not remain imprisoned in the darkness, enmeshed with the god of Hades, Hell, or the archetypal shadow – for this would certainly flag a potential psychosis that would need spirit and sustenance to pull one out of this psychotic morass.

The word pathology is comprised of pathos and logos. The logos of pathos exists in an ever-precarious balance. One can succumb to the instinctual nature of soul but miss the logos of spirit. The logos of spirit pulls one back into the world of the living, into the light with a renewed sense of direction and purpose fueled by the experience of spirit *in* the body. This experience is shared by the ancients and the moderns – when it occurs, it will never be forgotten for one will be forever changed. The marriage of pathos and logos gives life to the soul which endures forever.

individual and the temporary stopping of criminal behavior. Typically, the term is used to denote long-term abstinence from committing criminal acts by those for whom such offending has been an ingrained pattern of behavior. Some of the key empirical research that sought to understand and explain why people stop (desist) from committing criminal acts was conducted by Farrington (1996). He focused on juvenile delinquency and sought to explain why (and when) young people with a history of illegal and antisocial behavior might stop committing criminal and/or antisocial acts.

Explanations of Desistance from Offending Behavior

Several explanations have been advanced as to why people start to desist from crime: for example, the ontogenetic explanation (that “people will grow out of it”) or the sociogenic explanation (“people will find a partner, have a family and settle down”). However, both explanations have only weak evidence to support them, and both neglect the individual psychological characteristics of people, that is, the interpersonal differences. A third approach to explaining why people desist from crime focuses on the individual self, and many of the theorists who favor this third type, the person-centered explanation for desistance from crime, have focused on personality traits.

Self-Control and Desistance

One of the most prevalent personality traits that has been associated with committing crime is lack of self-control (Gottfredson and Hirschi 1990); and increasing a person's sense of self-control has been shown to be related to desistance from offending behavior. Self-control has been measured in a variety of ways, with one of the most widespread measures among the forensic psychology literature being through a measure of locus of control (Rotter 1966). Rotter's measure assessed the extent to which a person has an external locus of control (belief that it is outside forces, such as fate or luck, that determine what happens to them) or an internal locus of control

Desistance and Religion

Defining Desistance

In forensic psychology, desistance is used to describe the cessation of illegal or antisocial behavior. Desistance has been used to describe both the permanent cessation of crime by an

(the belief that a person's own abilities, efforts, and actions determine what happens to them).

Identity and Desistance

Maruna (2001) argued that the focus on personality traits to explain desistance from crime was misdirected and that we should instead look at changes in a person's self-identity. He suggested that, for an individual to choose to desist from committing criminal acts, they needed to create a prosocial identity, that is, the sense of self as someone who is altruistic to other individuals and/or to society generally. Maruna's ideas draw upon research that showed those offenders who did desist from crime had high levels of self-efficacy: they felt in control of themselves and their lives, they felt they now had a sense of purpose and meaning, and some had also managed to make sense of their past criminal behavior in the light of this new prosocial self.

Self-Identity and Desistance

There have been two main theories linking self-identity to desistance from crime. Giordano et al. (2002; Giordano 2014) suggested that desistance from crime can be explained by a quadripartite theory of cognitive transformation that involves an openness and willingness to change; exposure to events or people (for example) that create significant turning points or "hooks for change"; an ability to perceive a new prosocial self; and finally a change in the attitudes of the person such that they now see their former pro-offending attitudes as wrong.

Paternoster and Bushway's (2009) "Identity Theory" overlaps to some extent with Giordano et al.'s ideas, but also emphasizes the role of personal agency (one's awareness and sense of control over one's actions and behavior) in changing one's sense of self. They write about the "crystallized discontent" (Hallett and McCoy 2015, p. 858) that ex-offenders come to feel, fearing the person they were, and using this fear to drive themselves into being a better person.

The role of religion in desistance from crime can thus be understood in the context of each of these theories, as individuals strive to construct a prosocial identity, which integrates the previous "bad" self, with the current self and the person

they would like to be. Religion provides an ideal "hook for change" in this respect and offers up a reassuring narrative of change (and redemption) for individuals, no matter what crimes they have committed previously.

The Religious Self

Religion is a useful mechanism for constructing and expressing a change of identity; in particular, it is aptly equipped to help someone move from a negative identity to a positive one. Religion can help people to tell the story of their identity change and to account for previous bad actions. The religious individual (especially if they have the additional "new me" provided by religious conversion or rediscovery) offers up a recognizable prosocial identity. It also allows people to account for why their previous criminal actions were not true reflections of their core selves. This narrative shift is an important aspect in the creation of a prosocial identity and for the desistance from crime. Religious narratives enable people to view their lives through a new lens; religion provides a robust medium for people to reinterpret their sense of identity into something far more palatable (Maruna et al. 2006). Enabling ex-offenders to portray "good selves" can also help individuals to enact these prosocial roles, since people tend to act in line with the stories they present about themselves (Blagden et al. 2016).

What Else Might Religion Offer to Support Desistance from Crime?

Morality and a Positive Role Model

Morals (high ethical principles and standards of conduct) are said to be essential in evolutionary terms for a successful society (see Dawkins 2016). While morals may not be the sole province of religions, most religions do indeed set out tenets of moral behavior (such as the Ten Commandments of Christianity) which adherents of the religion are expected to abide by. When an individual commits themselves to a religion, the moral tenets of that religion, if followed, may also support

desistance from crime. The positive role modeling of such values by religious peers and, in particular, religious leaders will also support an individual's intention to desist from offending behavior.

Social System and Support

Religion does not just underpin a person's sense of identity, but typically brings with it a social network and support. Farmer et al. (2012) identified that individuals with sexual convictions who had desisted from further offending reported that they now had a sense of belonging and a place in a social group, in comparison to individuals who were still offending and who described themselves as socially isolated.

Summary

Religion can offer a useful framework for individuals to create a nonoffending self-identity. Moreover, religion can contribute to the cessation of offending behavior in a number of other ways, including the promotion of prosocial behavior and a set of moral guidelines for living one's life. Religion also typically provides an individual with a system of social support, reducing feelings of alienation and social isolation which may contribute to offending behavior.

Deus Absconditus

Meredith Lisagor
New York, NY, USA

Evolution and Variants of a Theological Concept

Ancient Egyptian and classical Western mystery religions can be said to rest upon the inscrutability of deity, but a concept of god as partially knowable yet ultimately inaccessible by any sort of mediation is the fruit of the Judeo-Christian tradition. Various detailed by different theologians as

early as Clement of Alexandria (ca. 150–215), notions about god as hidden, or *Deus Absconditus*, generally take their biblical warrant from Isaiah 45:15, “Truly, you are a God who hides himself.” Old Testament injunctions against seeing or looking upon god and New Testament recapitulations (e.g., “No man hath seen God at any time; the only begotten Son, which is in the bosom of the Father, hath declared Him.” John 1:18) may also have influenced discussions of deity’s purposeful invisibility. But the crafting of theology based on the hiddenness of God would not occur until the Protestant Reformation.

Cited chiefly in context of the indefinability of the one transcendent god in words, concepts, or images, *hiddenness* was significant to early Christian thinkers only as it was implicit to the direct self-revelation of a personal god. In short, while God had revealed something of His personal nature in Jesus Christ, whatever was not known he had chosen to hide.

Clement, a polite opponent of Gnosticism, proposed that through illumination by Christ as the incarnate Logos, humanity, being made in God’s image and likeness, could and was even meant to gradually understand God, the otherwise “Unknown.” For his pupil Origen (ca. 182–254), humanity’s likeness to the divine pointed to a kinship between them. And God’s Logos, revealed in Christ, then hidden again after the resurrection, was “an example,” imitation of which would make the faithful proper “partakers of the divine nature” (Origen 1979, p. 319) at Parousia.

However, John Chrysostom (ca. 347–407), in vehement rejection of the Anomean Arians’ presumption that they understood God’s very essence, proceeded from the conceit that God was in truth wholly other, utterly “unapproachable” as stated in 1 Timothy and “unsearchable in His judgments” as declared in Rom 11:33. In this, Chrysostom apprehended the psychic consequences for the individual in relationship with such divinity, and, according to theologian Rudolf Otto, spoke to the very core of the creature’s experience of the numinous, which is unrational, terrified, and yet drawn to it in fascination.

Augustine (ca. 354–430) engaged the idea of God as hidden and unknowable in His essence, but emphasized the way in which God’s visible miracles draw one toward Him through the love and faith they inspire. Pseudo-Dionysius (ca. fifth century), adumbrating the mature Christian mysticism of the high Middle Ages, envisioned the possibility of ascending to the very “ray of the divine shadow” (Pseudo-Dionysius 1987, p. 135), however, only by “renouncing all that the mind may conceive [about God]” (Pseudo-Dionysius 1978, p. 137). Nicolas Cusanus (1401–1464) elaborated on the nature of such renunciation in his *Dialogue on the Hidden God*. But it was Martin Luther (1483–1546), driven by recurring bouts of self-doubt, guilt, and despair, who gave the most trenchant and exhaustive attention to the notion of *Deus Absconditus*.

Luther’s lifelong emotional and psychosomatic sufferings, which he termed *Anfechtungen*, made him question whether they were assaults by the devil or God Himself, who though all-loving had nonetheless subjected His only begotten son to the extremity of suffering. If the latter, Luther concluded, “God hides his eternal goodness and mercy under eternal wrath, righteousness beneath iniquity” (Luther 1972, p. 62). Thus, everyone will know periods of rejection by Him, as had Christ on the cross where God was simultaneously revealing His redemptive love. Indeed, the god-head embraces all contraries, and its justice – in wrath or grace – is hidden from reason. Only through faith in Christ crucified, insisted Luther, can one approach God’s true nature and “believe him merciful when he saves so few and damns so many. . .” (Luther 1972, p. 62).

With the Age of Reason, concern about God’s hiddenness waned. At the dawn of modernity, the last notable reflection on the topic is to be found in the *Pensées* of mathematician and Roman Catholic-convert Blaise Pascal (1623–1662). In these reflections he proposes that God hides Himself so that humanity might come to Him by an act of will; to be fully revealed would make Him a matter of fact, requiring no commitment from the believer.

God and the Splitting Phenomenon

Among modern thinkers, Martin Luther's doctrine has occasioned much critique, both theological and psychological. Erik Erikson, in a definitive biography, sees Luther as achieving in the construct of institutional religion "a living reformulation of faith" that points one back to "basic trust" (Erikson 1962, p. 257), a feature essential to the healthy emergence of ego that is often impaired by the censure of the later developing superego. Luther's *Anfechtungen* were, psychologically speaking, reactions to a highly charged superego forged in the milieu of a censoring father. According to Erikson, by conceding that behind God's wrath and prior to it exists compassion, Luther not only approached a resolution to his personal struggles but also rehabilitated religion's capacity to reaffirm the beleaguered "basic trust" of the faithful.

While theologians debate the nuances of Luther's exact meaning in his highly varied use of *Deus Absconditus*, Rudolf Otto credits the reformer with revitalizing rational theology by identifying his personal terror and fascination with experiences of the divine. C. G. Jung, who asserted that the "only statements that have psychological validity concerning the God-image are either paradoxes or antinomies" (Jung 1953, p. 11n), affirms that Luther had grasped a critical nonrational truth when he spoke of God's dark side: His doctrine can be said to hold up the numinous, disowned shadow material of the collective unconscious, which must always be considered the natural habitat of contraries.

A truth, then, that both Luther's theology and personal history illuminate from the Object-Relational vantage point is the inherent – to be sure, essential – tendency of the human psyche toward *splitting*. Luther's God could easily symbolize the psychic field on which an ego that cannot tolerate ambivalence keeps internal objects separated into good and bad, comforting and punishing – God as the compassionate beloved, a representation of the cossetting mother who reflects the infant's goodness back to it; God as persecutor, hostility split off, and projected. Harry

Guntrip, discussing the splitting of ego itself – into *libidinal*, *central*, and *antilibidinal* – notes how an individual will both repudiate (through the antilibidinal ego) and defend a weak libidinal ego against "outer world pressures and inner world fears" (Guntrip 1992, p. 184) by hiding it behind central ego aggressiveness, obsessive self-mastery, addiction to duty, and physical illness. Despite Erikson's characterization of his triumph, Luther – renowned for volatility, hyper-scrupulosity, and an assiduous work ethic – never overcame periodic depressions and psychosomatic crises.

It must be acknowledged that the phenomenon of splitting is implicitly central to any conceit of *Deus Absconditus*, for regardless of the interpreter – and whether or not God is envisaged as the thing of which humanity is Its image and likeness or a screen for human projections – God hidden represents half a perennial debate: the Godhead's immanence versus Its transcendence. In their delineations of the ways in which the Hidden God might be known, Clement and Origin, Augustine, and the Christian Mystics all point to Christ as signifying a reconciliation of these modes and mooting, if not resolving, the issue of hiddenness. In psychodynamic terms, what they intuited was that Christ represents a well-integrated psyche, the still point at which good and bad objects stand in healthy tension. At the same time, he models the ways in which *introjection* and *projection* facilitate development and relationship: Where Jesus as human was awakened to his divinity, he may be said to have introjected the Father (divine or personal), making Him indeed immanent even immediate and available as a building block of ego and an internal-object world; while Jesus ascended becomes the projected image of an ideal, transcending (or eluding) the domain of the ego yet remaining in relationship with it.

An Affect Regulation Take

A suggestive point arises at the convergence of Object-Relations and Attachment theories in recent discussions of neurobiology and affect regulation.

The elusive-but-desired or (as in the case of Luther) unpredictably present-but-critical “God” might be identified with an unconscious internalized object that resulted from neurologic imprinting caused by experiences of “self-interacting-with-a-misattuned-dysregulating-other” (Schore 1994, p. 473) – *mother or father*. That is to say, the consequences of a primary caregiver whose affect fails to reflect the infant’s enthusiasms at critical junctures (and/or meets the infant with impatience, disdain, or anger) are not only psychic storage of self- and other-representations corresponding to the misattunement, but also orbitofrontal cortex development primed for future affective replications: A psychobiological expectancy for consequent relations – unto a relationship with a God – to recapitulate the affective experience in the original misattuned dyad. Otherwise put, Deus Absconditus could be hardwired.

Freudian and Jungian Takes

Perhaps nothing speaks more potently to the concept of the Hidden God than Freud’s theory on the origin of religion as the murder of the primal father by sons who wanted unimpeded access to the primal mother (*Totem and Taboo*, Freud 1957). The father’s elevation to the status of a god is a sublimation aimed at palliating guilt and eradicating the crime from racial memory. In this context, a fantasy of a Hidden God might be considered a redoubling of the sons’ effort to shield themselves from return of the repressed memory. And Isaiah’s assertion that God “hides himself” would be a disingenuous displacement of responsibility – since it is we who have done the hiding. Returning to Luther, his Oedipal conflict with a harsh and disapproving father, which lasted a lifetime, could be said to have made him less able to combat the repeated “return of the repressed,” and more highly identified with Christ as the son who suffered to atone for collective sin (the disguised primal murder). To go this far, however, is to be obliged to suggest Luther’s subjective identification with Christ as exalted in resurrection to equal status with the Father; which Freud could say any Christian does vicariously in the transformed totem meal, the Eucharist, where

God is present but hidden. The Christian, thus, stirs the repressed memory of an archaic crime in regular ritual; and, theoretically, we could say that he or she may never be able to fully outgrow the regressive ambivalence of the Oedipal drama.

In Pascal’s contention that God is purposefully hidden, we also find classical psychoanalytic implications. Certainly, the thesis suggests the voice of the superego: God, or something higher in the human makeup, has expectations of the believer; and trust as an accomplishment of good ego consolidation is more valuable (to the internalized father and the ego) than an act of memory which does not engage the individual’s value assessing capacity. Placing the thesis, then, in the context of the primal murder, Pascal may be thought to have unconsciously recognized that the internalized father wants the faithful to recognize the primal crime and to atone through an act of character, with consciousness and volition – and he is not going to make it easy. More practically speaking, the superego wants the ego to recognize its obligation to master the impulses of the id.

For C. G. Jung, the realm of the instincts, the unconscious, calls the ego to acceptance and humility. Its task is not so much to subordinate drives as to negotiate with them, and to learn as best as it can their symbolic language. Neither, however, is the ego to be subordinated by the unconscious. It should learn that it is itself archetypal and elemental of the greater psyche represented by the *Self* – the correlate of totality, wholeness, the impersonal God, whose center is everywhere and circumference nowhere, as St. Augustine observed. Augustine was also able to approach the idea that we shall not know God in His essence, but rather by as much of the instinctive numinosity as consciousness can metabolize. And such is the wisdom that informed the Pseudo-Dionysius when he saw that one might understand something of divinity only after one renounces what the mind (thinks it) knows. Jung would say, perhaps, that God’s very nature is hiddenness and it is only through letting go of qualifying and quantifying intelligence that consciousness experiences the true intimations of wholeness.

Deus Otiosus

David A. Leeming

University of Connecticut, Storrs, CT, USA

Blanton-Peale Institute, New York, NY, USA

In many religious traditions, the creator god essentially retires from the world he has created and leaves it to others to run – to humans or lesser gods. In short, he does not interfere with the world once he has created it. His mythological relative is the Deus absconditus who more actively absents himself from his creation. For the purposes of psychological interpretation, the two types can perhaps be considered to be synonymous. Many African creator gods leave creation to tricksters or to their sons. Sometimes, as in Greek, Anatolian, and Indian mythology, the old high god is forced out and is replaced by young upstart deities. Christian theologians, such as Thomas Aquinas and Martin Luther, have used the hidden god concept to emphasize that God is unknowable but that we can know God through the tangible “living” Christ, Jesus. Deists, on the other hand, find in the Deus Otiosus – the clock-make God

who made the world, wound it up, and then left – simply a rational explanation for life as we know it.

The psychological importance of the Otiosus/Absconditus is complex. For some peoples it expresses a “family” that senses desertion by the father and the consequent trials and tribulations of life. For others – Aquinas and Luther, for example – it signifies the gift of the God revealed or embodied in the Christ with whom the worshipper seeks emotional and psychological unity. Mystics of all traditions would find positive psychological energy in the “hidden” god within with whom the individual achieves perfect union or self. For Deists the God who withdraws gives the gift of psychological and moral independence and self-reliance. For the atheist the Deus Otiosus is a myth used to excuse the evils of life. For those who doubt but long for a better life, the hidden god is an inner security longed for but painfully absent.

Devil

Jeffrey Burton Russell
Department of History, University of California,
Santa Barbara, CA, USA

Origins

The word “Devil” derives from Greek *diabolos*, meaning “adversary.” In Jewish, Christian, Zoroastrian, and Muslim traditions, the term applies to

a single spirit of evil whose function is to oppose the will of the good God. In Zoroastrian tradition, and in the Manicheism that derives from it, the Devil, named Ahriman, is a god of evil and darkness in opposition to the god of goodness and light, Ohrmazd. The two gods struggle against each other until the end of the world, at which Ohrmazd will triumph and annihilate Ahriman. In Jewish tradition the Devil is most often identified as Satan, though he also has many other names. In the Old Testament (Hebrew Bible), Satan’s role is usually unclear, and often the term “Satan” is used as a generic term for an opponent. When the Hebrew scriptures were translated into Greek about 200 BCE, the term *diabolos* entered scriptural usage. Though only marginal in earlier Hebrew thought, the Devil, under various names, became of much greater importance in Jewish pseudepigraphical literature (materials falsely claimed to have been written by ancient Biblical figures such as Enoch) from about 100 BCE to about 150 CE. The mutual influence of Hebrew and Zoroastrian thought is still unclear, but in any case, the Devil was a hugely more sinister power in the pseudepigrapha than in the Hebrew Bible.

Christianity

This is precisely the period in which Christianity arose, and the power attributed to Satan in the New Testament and in other early Christian writings, though less lurid than in the pseudepigrapha, and never as great as that in Zoroastrian texts, is nonetheless a huge threat to Christ, to the Christian community, and to Christian individuals. He is tempter, accuser, tormentor, and jailer of the damned in hell. In addition to the canonical Christian writings, a number of allegedly Christian but actually Gnostic texts, mainly from the second century CE, derived their ideas from the pseud-epigrapha and took the power of the Devil to almost Zoroastrian extremes. For most of the Gnostic sects, the cosmos was a battleground between the God of light and spirit on the one hand and the Devil, lord of darkness, and matter on the other. Thus, the Gnostics created a matter/

spirit dichotomy, which they melded with the Zoroastrian good spirit/evil spirit dichotomy. Such a dichotomy was explicitly and firmly denied by orthodox Christianity, in which the Devil's power, though great and fearful, was always weaker than that of Christ. Anyone calling on Christ against the Devil would be saved, and at the end of the world, Christ would cast Satan and his fellow demons forever into hell. Belief in the existence of a Devil as the personification of evil has never been a necessary Christian dogma, but tradition, based on the New Testament, assumed his reality, and in certain periods of history, notably the second to fourth centuries CE and the fifteenth to seventeenth centuries CE, his power was widely believed to loom large. In the latter period, terror of the Devil was the motive force behind the witch craze.

Islam

Muslims, unlike Jews and Christians, believed that their scripture, the Qur'an, was dictated word for word by God through an angel to the prophet Muhammad. Thus, no word of the Qur'an could be ignored, so the existence of the Devil (called Iblis or Shaytan) could not be denied. However, Islam differed from Judaism and Christianity in another important sense: the will of Allah prevails in every place throughout all time. This means that opposition to Allah either by humans or by spirits was limited entirely to what God wills to allow.

Polytheism

As opposed to the religions above, most religions recognized no single spirit of evil. The problem of evil was solved in a number of different ways. Some religions posited deities combining good and evil in themselves, such as Quetzalcoatl in ancient Guatemalan religion and Vishnu in Hinduism, where he was both creator and destroyer. Another solution was "doublets," pairs of gods in which the good side has one name and the evil side another, as with Hathor/Sekhmet and Horus/

Seth in Egypt. Yet another solution was to have groups of generally constructive deities at odds with groups of generally destructive ones, as in the asuras and devas in ancient Persia and India. Another was to have gods who are amoral or at least very inconsistent in their morality, as in Greco-Roman religion, where the traits assigned to each deity were wide and varied. Artemis/Diana, for example, was patroness of childbirth and virginity, animals and the hunt, and the moon and the underworld. Still another way, in some Hindu and Buddhist thought, was to deny the existence of any real evil, considering good and evil part of *maya*, the illusion that anything in this world is real, an illusion that must be transcended in order to reach enlightenment.

Romanticism

In the West since the nineteenth century, alternative approaches to the Devil multiplied. That century was marked by the esthetic movement known as Romanticism, which emphasized feelings over reason and rebellion over tradition. For Romantics such as Victor Hugo, the Devil became a hero symbolizing the revolt of the human spirit against secular and religious authority. The Devil as hero reemerged in the late twentieth century in Satanism, a cult whose followers tended not to take their beliefs seriously; those who did take Satan seriously held the meaningless view that a being whose concept was *invented* to represent evil is actually good.

Modern Criticism

Much more dominant in the late nineteenth and twentieth centuries was the growth of physicalism, pragmatism, and deconstruction. These brought about a reevaluation of evil and thus of the Devil. Physicalism was the philosophical belief that only material things that can be quantified are real, and so the spiritual exists only as an illusion. In such a view, evil itself is only an outdated metaphor for antisocial behavior. Twenty-first-century psychiatry tended strongly

to the view that most, if not all, psychological problems are the result of genetic, hormonal, and even molecular malfunctions. Freudian psychoanalysis, which dominated from the end of the nineteenth past the middle of the twentieth century, held that evil sprang from the repression of sexual and other strong feelings into the unconscious, which distorted the repressed feelings into ideas and behaviors that the conscious was unable (without analysis) to deal with. Freud of course dismissed the concept of the Devil as unhelpful and even harmful, as people often projected their hateful feelings onto other people. Psychoanalysis was inherently pragmatic in its goal of helping people adjust successfully to their environment. Jungian analytical psychology took the Devil more seriously as one of the archetypes that the universal human mind invented (or perhaps inherited) as a way of understanding evil, which Jung took seriously itself.

Deconstruction, which dominated philosophy the last three decades of the twentieth century and the first decade of the twenty-first, maintained that every human concept was an infinitely malleable construct. There being no absolute truth or, indeed, any truth at all beyond what the individual constructs for himself or herself; each concept can be infinitely deconstructed. Thus, the Devil exists or does not exist depending on what you believe, and his characteristics were whatever you think they are. Along with the Devil, evil itself was deconstructed to mean whatever an individual found inappropriate or repulsive. No concepts, even scientific, logical, or mathematical ones, were excluded from deconstruction, so that, a fortiori, fuzzier theological and philosophical views such as the Devil were swept away. Deconstruction mated with pragmatism to produce the dominant view that no concepts were true, so that good and evil were merely constructs that those with power force upon those they dominate and manipulate.

Still, the first decade of the twenty-first century saw a large religious revival in many parts of the world, and Christians and Muslims who remained true to their theological traditions took the Devil seriously, as a supernatural entity or at least as a powerful metaphor of the existence of radical evil.

Dhyāna

Prabhath Sirisena

University of Colombo, Colombo, Sri Lanka

Dhyāna (Sanskrit) or *Jhāna* (Pali) is a state of meditative absorption or concentration in Buddhism, sometimes translated into English as trance, or referred to as an altered state of consciousness. There are eight *dhyānas*, increasingly deepening in concentration. In the first four *dhyānas*, the meditative experience contains

some perception of form or materiality. Based on the fourth *dhyāna*, the meditator can change the object of contemplation so that the perception of form disappears, leading to the four formless *dhyānas*.

The *dhyānas* are attained through tranquility (*samatha*) meditation, where the mind is trained to focus on a singular object. *Visuddhimagga*, a Theravāda Buddhist manual from the fifth century CE, lists 40 such objects, ranging from visible things such as earth, water, fire, and various colors to feelings and attitudes such as kindness, compassion, and equanimity. Among these, the meditation on breath is particularly well known: the early Buddhist texts claim that it was used by the Buddha himself to develop *dhyānas* on his way to attaining *nirvāna*.

As the meditator gains increased concentration on the chosen object of meditation, and the five hindrances of sensual desire, ill-will, sloth and torpor, restlessness, and doubt are suppressed in the mind, the first *dhyāna* may arise, which has the characteristics of applied and sustained thought of the object, rapture, and bliss. After gaining mastery of the first *dhyāna*, by deepening the concentration, one enters the second *dhyāna*, where there is rapture, bliss, and oneness or unification of mind. Rapture disappears in the third *dhyāna*, which is characterized by bliss and unification of mind. In the fourth *dhyāna*, bliss disappears, and unification of mind is accompanied by equanimity. To progress from the fourth *dhyāna* to the formless *dhyānas*, the meditator has to let go of the object of meditation and replace it with the perception of space. When this perception of space encompasses the entirety of experience, the first formless *dhyāna*, the dimension of infinite space, is obtained. Reflexively focusing on the mind that is aware of space and letting go of the perception of space itself, the second formless *dhyāna* of the dimension of infinite consciousness is attained. In the third formless *dhyāna*, the mind is pervaded by the perception of nothingness. Perception itself becomes so subtle in the fourth formless *dhyāna* that it is called the dimension of neither perception nor non-perception. Thus, in each successive *dhyāna*, the experience is made more refined

by relinquishing one or more factors from the previous stage.

In Buddhist practice, the attainment of *dhyānas* is not an end in itself but a means of reaching the final goal of *nirvāna*. *Dhyānas* themselves are conditioned states, reached by developing certain perceptions and transcending others, subject to change and impermanence. By developing *dhyānas* the meditator gains knowledge about the conditionality of experience and is able to use it as a foundation to develop insight (*vipassanā*), which culminates in realizing *nirvāna*.

Dhyānas are difficult to attain and require extensive practice, often over a long period of time under the guidance of a competent teacher, so it is rare to encounter meditators who have experienced them, even in traditional Buddhist countries. According to the Buddhist monastic code, *dhyānas* are considered suprahuman achievements that monks and nuns are required to keep private, which further discourages open discussion of those experiences. This has resulted in *dhyāna* receiving limited attention in psychology and psychotherapy, as opposed to other forms of Buddhist meditation such as mindfulness. In recent times, however, there has been a renewed interest among Western practitioners about *dhyāna* meditation and how it relates to mindfulness and *vipassanā*.

Dionysius the Areopagite

Dimitrios Pallis

Faculty of Theology and Religion, University of Oxford, Oxford, UK

Introduction: The Author and his Writings

Scholars in the field of so-called “Christian mysticism” use the name “Dionysius the Areopagite” (henceforth “Dionysius”) to refer to the interesting author who employed the name of the well-known Athenian disciple of Paul as his pseudonym (Acts 17:16–34). His writings, which are composed in Greek, began to become known in the early sixth century, while the first formal reference to them as a corpus of texts with apostolic authority seems to have been made by the supporters of Severus, Patriarch of Antioch, in a colloquy in Constantinople in 532. At this meeting, one of the key representatives of the party that was engaged in discussions with them expressed a query motivated by theological considerations with regard to these writings. In the medieval period, the supposed apostolic authority and the persuasive staging of the texts contributed to their popularity among readers. However, it is possible to argue that it was primarily the spiritual quality of the writings ascribed to Dionysius that underlay their positive reception: although their pseudepigraphic character was clearly established during the European renaissance, they continued to be a source of inspiration for both Catholic and Orthodox theology. Despite following different hermeneutical paths, for both of these traditions, Dionysius’ works contributed to the development of what could be termed Christian “mystical theology.”

Dionysius was a Christian thinker and theologian who employed Neoplatonic philosophy. His writings comprise of four treatises and ten epistles. These are presented as part of a wider corpus which he may not have actually written. It should be noted that one of his “lost” treatises is entitled *On the Soul* and engages with the human

soul from a metaphysical perspective. Dionysius may have had in mind similar works written by gentile and Christian authors. His extant writings are as follows: *On the Celestial Hierarchy*, which uses symbols from the sensible world to describe the ranks of angels and the way these lead man to God; *On the Ecclesiastical Hierarchy*, which discusses the rites and social structures through which man can achieve likeness with God; *On the Divine Names*, which explains the names that refer to God; and *On Mystical Theology* on the soul’s ascent toward God. The epistles include complementary material on the topics covered in the treatises. A number of scholars consider these to form a coherent corpus, with linguistic and structural similarities and several common themes (e.g., Golitzin 2013). One of the most representative themes of the corpus is deification, which concerns the way in which man can achieve union with God. Dionysius develops a “theological anthropology,” which he documents through the theory and practice of the Christian religion. Aspects of this are assessed in some studies based on ancient and modern psychological perspectives (Esposito 1997; Henderson 2014).

Staged Narrative and the “Kenotic” Subject

A careful reading of the corpus indicates that Dionysius consciously aimed to “stage” his assumed identity as an author from the apostolic age. This is evident from the fact that most of the names of the recipients of the treatises and epistles are also found in the New Testament. The same is true of the names that are mentioned within the texts. Dionysius also uses names which are shared by individuals from early church history. Some researchers have shown that this could reinforce rather than undermine the staging (Stang 2012; Louth 2013). The modern conception of the historical past differs in several ways from the conception of the early readers of the writings of Dionysius. The pseudonymous author chooses to use the name of a man for whom, at the time when the corpus appeared, there was no fully formed “hagiographical tradition” (as is the case with

others who were already established in the Christian tradition). Dionysius' choice and use of the specific pseudonym indicate that he takes into consideration what his contemporaries would be able to understand from his writings so that he could "persuade" them. In other words, he carefully followed the ways in which they interpreted the history and the sources of their tradition.

It is also important that Dionysius places his teaching within the framework of a community of Christian believers and worshippers. The recipients of his texts all have social roles that are related to the structure of the ecclesiastical community. An individual can attain union with God within the context of the rites of the Christian church. The unknown author mentions his participation in the rite of baptism, through which he became a member of the church, while he also puts emphasis on the importance of another rite. This is consistent with the staging of the corpus, since, according to the tradition, Paul's disciple was a bishop. However, it is possible that this also reflects the experience of the actual author. Most researchers view him as an author with a consciously Christian identity. Dionysius teaches of an erotic God who "empties" himself and becomes man. He also refers to erotic men who follow this example in order to attain union with the archetype of love. His teachers in the Christian faith were such men. It is therefore not impossible that the author, too, empties himself both as an author and a man initiated to the Christian rites (Kocijančič 2011; Stang 2012). The forgery of the corpus is both "constructed" and "experienced." The author's undertaking is thus deeper than an attempt at staging.

Angels as a Means of Pedagogy

The existence and role of angels in Christian religion is sometimes viewed with skepticism in contemporary psychology and even theology (examples of this are given in Potter 2016). However, Dionysius presents his own testimony as an author through the historic and cultural

context of his own thought (*On the Celestial Hierarchy*). An aspect of his work that is interesting from the point of view of modern psychology is that Dionysius and his contemporaries believed in the presence and active role of angels in human life. Other gentile and Christian authors of the time also refer to angels. It is worth stressing that Dionysius' treatment of the topic is more systematic than his predecessors: he devotes an entire treatise to this topic, as well as another which is supposedly "lost." This is significant because it allows him to develop his teaching on man and his union with God in greater detail. Aspects of Dionysius' teaching regarding the angels in the extant treatise that may be of interest to modern psychology are their role in emphasizing God's transcendental nature and supporting the author's proposed structure of the religious community. Finally, they provide a theoretical model of human social behavior.

It should be noted that Dionysius' account of the angels is not distinct from the rest of his teaching. These created beings are immaterial and bodiless and need to be approached according to the capacities of humans given that the latter are made up of body and soul. Thus, in his descriptions of the angels, the Christian author uses images from the sensible world. This is a pedagogical method which also serves to reinforce the hermeneutical principle that God, as their Cause, is beyond human conceptions of him. Moreover, Dionysius classifies the angels in ranks in such a way as to link them with his teaching on the religious community. Both the angelic and human social networks have a similar structure; this enables the author to use the former as a model of how the community of those who participate in the rites should function (cf. also Muehlberger 2013). Dionysius envisages a ritual tradition which views the angelic realm as a reflection of the human and vice versa. The metaphysical aspect truly exists and is not an invention of the human mind. The author formulates this theoretical paradigm in order to guide his readers. In this way he imbues the means and functions of the religious community with a "symbolic" meaning that refers to the celestial image of it.

Christian Life and the True Self of Man

A key aspect of Dionysian thought relating to union with God is that it is understood through the practice of the religious community. The author devotes an entire treatise to describe and interpret how the faithful become part of the body of the Christian church and participate in its rites (*On the Ecclesiastical Hierarchy*). Similar elements can also be found in the rest of the corpus. Dionysius views man as “unfolding” erotically through this “therapeutic framework.” He is aware of a wider tradition in Christian thought that places the sacraments within a specific “theological narrative” and formulates his teaching on man through this. The various processes that take place during the course of treatment are sometimes similar to those that can be observed in “Christian life.” Dionysius describes man’s path to catechesis and his subsequent participation in the sacraments as a gradual shift from a long-suffering life to a stable condition. Moreover, he points out that the subject moves from intellectual fragmentation and false beliefs to an acceptance by the religious community which is based on common faith and way of life with the other members and the assumption and fulfillment of a social role by each individual member. It is within this context that one directs one’s love toward God and fellow humans, acting with freedom and imitating the example of God himself who as a “lover of mankind” became man.

This narrative includes elements that touch on different theoretical areas. One of these is the ontology formulated by Dionysius through the theological exegesis of the sacraments of the church. Its basic principle is that the sensible symbols used in the sacraments themselves share in God and are not merely an intellectual “convention” invented by man. This realist “semiotic theory” refers to the participation in God himself by man through the sacraments, which is entailed by their role as a means for man’s communion with God. Dionysius would have identified this principle both in the theurgical trends of Platonism and in the liturgical theology of the eastern Christian tradition. Another area is social. The relationship between God and

man presupposes a religious community with a hierarchical structure in which its members fulfill distinct roles. Dionysius places within this framework a form of “ascetic” freedom which follows the example of Christ, the God-man, who served the will of God the Father steadfastly during his time in the world (without the divinity of the second Person of the Holy Trinity being diminished through the Incarnation). This can also be ascertained with regard to the hierarchical structure of the community as the “body of Christ”: each member fulfills a social function, according to his place in the collective body, and thus man emulates Christ’s example on the collective rather than the individual level. Another theoretical area touched on here is psychological. Dionysius conceives of the human soul as tripartite (reason–spirit–appetite) and its parts as a “hierarchy” that is complete in itself. This view can be traced in his Platonic and some of his Christian predecessors. Dionysius links the submission of the two lower parts of the soul to reason with the community: a disciplined soul may serve what is ordained by the principles of collective coexistence, and thus the psychological and social elements may coexist, like two concentric circles (Pallis 2019).

Sacraments and the Language of the Community

One component of the practice of the religious community which may be of interest to modern psychology is the “special language” used by the community for the purposes of teaching and worship, for example, the hymns offered by its members and the reading and interpretation of scripture by the person who presides over the religious community. Both of these are observed during the liturgy. Several parts of this and other rites have their origins in scripture. Dionysius was aware of a theological tradition that understood the role of scripture within the framework of the sacramental community. Scripture cannot be read as the object of a personal search for truth by individual members of the community in isolation from one another; rather, it is the community that determines the correct interpretation of scripture,

as can be seen in catechetical instruction and hymns. Dionysius states that faithful adherence to scripture is the basis of theology. He also notes that his own writings are a kind of “commentary” to the works of a man he introduces as his teacher and these works are in accordance with scriptural teaching. This shows that he himself perceives scripture and its spiritual meaning as knowledge that he received from the community. At various points in the corpus, it becomes clear that he himself has undertaken to hand down this knowledge without distorting it. This indicates that Dionysius formulates and develops further a “social theory” of knowledge.

Dionysius refers to topics that are related to scripture in each work and in the epistles of the corpus, as well as in some of his “lost” works. In one of his works, he discusses the names ascribed to God, noting that these can be found in scripture, and provides an account of his teacher’s extraordinary performance in celebrating the Eucharist (*On the Divine Names*). This could indicate that these names were also used in the sacraments of the community. Of interest here is the concept of “individuation” found in one’s preparation to become a member of the religious group and participate in its religious practices. The author likens catechumens to fetuses which are gestated by the teaching of scripture within the community and are born through baptism so that they are able to participate in the Eucharist. These procedures are determined by the “tradition” of the community. The same happens with the lapsed members of the community who wish to participate anew: they cannot be present at the main part of the rite until the collective body is certain that they have assimilated its way of life. This requires “pastoral guidance” from its initiated members.

Knowledge of God and the Body–Soul Relationship

Another important topic in Dionysius’ thought is the way he makes use of the knowledge of God acquired by humans, since it takes into account their psychosomatic being. Both the intelligible symbols found in scripture and the sensible symbols used by the community in its rites serve

human needs. This does not mean that they are not true symbols. However, they are adapted to man’s capacity to approach God. Dionysius considers these symbols to be a gift of God’s “charity” (i.e., love) for man. As regards the sensible symbols, he stresses that man is able to partake in God as a result of the Incarnation. This forms the basis for the community’s use of ritual practice with reference to God. The author presents Christ as an exemplary teacher who uses parables to educate. He also considers him to be an exemplary presider at the rites, since he handed down the Eucharist through material symbols. In both cases, he offers man knowledge in a way that man can receive. Dionysius’ approach is thus grounded in the fact that the recipient is composed of body.

In describing knowledge of God in this specific way, Dionysius also ascribes an important role to language. Three stages in man’s relationship with God can be identified: cataphatic and negative theologies (the way we speak of God) and, subsequently, the soul’s union with him (*On Mystical Theology*). The first two relate to the names used by man, particularly in scripture and rites. The next stage is defined as an “ecstatic” state of being. Man glorifies God through cataphatic and negative names. However, in the course of man’s ascent toward God, the soul transcends these names and achieves union with God, who is far beyond anything that created man can come to know through his intellect and senses. Dionysius likens the soul’s ascent to the entrance of the ritual presider into the altar during the Eucharist. We may infer from this that the Christian thinker understands that the ecstasy in question is attained in the context of the ritual practice of the Christian community. This means that it is not a private experience or limited to a small group of initiates. Moreover, it is not achieved through technical means other than those provided by the life of the community. The description of the soul’s ascent also conveys a sense of “transcendence” experienced by man before the Cause of his being. These are some principles of Dionysius’ teaching on knowledge of God.

It follows that various aspects of this corpus are of interest to modern psychology. One is that

Dionysius carefully follows the notion of tradition and historical past developed by his possible readers to make his account more persuasive as a pseudonymous author. This practice is not merely a tendency to share in the identity of the ancient figure he pretended to be. It is also the result of his conscious affiliation with the Christian collective identity of his own time. Another aspect is that he employed several beliefs about angels of his time to educate his readers about God and to provide them with a model for their own life and social behavior as a Christian community. He also provided them with an important exposition of the sacraments and analyzed them in a way that clarifies their role for the spiritual growth of a human being within that religious framework. A further aspect of interest is the theory of knowledge that he outlines within the same framework. The community is responsible for both the initiation of those who wish to become members of it and the development of its initiates by making use of religious texts and hymns. They are used in a way that takes into account the individual needs of humans. The same is true of the sensible symbols which consider that humans are composed of both body and soul. These elements suggest a kind of theological pedagogy provided by the community. A final aspect is that the initiates to this body use the means provided by it to approach the transcendent God, before whom they become aware of their existential limits.

Dionysos

Alexandra Krithades

CG Jung Institute of New York, New York, NY,
USA

Dionysos (*Bacchos* in Latin) is the son of Zeus and Semele. He was twice born, and the special circumstances of his birth indicate his unusual nature and the special place he occupies in Greek mythology and religion.

His mother Semele (possibly a goddess of Phrygian origin) was tricked by the jealous goddess Hera into requesting Zeus to appear before her in all his radiance. He reluctantly did so, and she was incinerated by the fire of his lightning. The baby, of 6 months gestation, was rescued from his dying mother's womb and sewed into Zeus' thigh to be gestated a further 3 months. When Dionysos was born, he was brought to the mythical Mt. Nysa to be raised by nymphs. This aspect of his history echoes his father Zeus' early origins. His life threatened by his devouring father Chronos, the infant Zeus was spirited away by his mother to be raised by nymphs on Mt. Ida in Crete.

The Orphic version of Dionysos' beginnings also includes a "twice born" element. According to this tradition, Dionysos was the offspring of Zeus and Persephone and became the fourth ruler of the world, after Ouranos, Chronos, and Zeus. The Titans were jealous of the child and plotted to destroy him, perhaps, with the incitement of Hera. They distracted the child with a mirror and other toys, then killed him and tore his body into seven pieces. Apollo, on orders of Zeus, collected his limbs and took them to Delphi. Athena saved the heart and brought it to Zeus, who then enabled Dionysos to be reborn. In a rage, Zeus killed the Titans with his lightning. They were burnt to soot, and from this soot, a substance was made from which humans were fashioned. Since the Titans had ingested some of the god, mankind is seen in the Orphic religion as part divine and part Titan.

His survival of fire and/or dismemberment points to a key psychological aspect of Dionysos. His myth expresses the inevitability, even necessity, of destruction within the psyche, as well as the psyche's ability to be reborn in the face of such destruction. The experience of dismemberment is something that most people who enter psychoanalysis or psychotherapy feel to some degree. In the beginning of analysis, analysands often have dreams with dismemberment motifs. The work of analysis involves the dismantling of personality structures, attitudes, and adaptations that no longer serve the individual or his/her life force.

Dionysos' survival of these experiences is an expression of the indestructible aspect of life

itself, not on the level of the individual but life as a force of nature, that is, larger than our egos alone.

Dionysos is seen as having both masculine and feminine traits. He is associated with various animals, including the bull, the lion, the snake, the leopard, and the dolphin. He is depicted as both young and old and is the most elusive of all the Greek gods. In the plant world, he is associated with the grapevine, ivy, the pine tree, and the wild fig.

His myths and cults are always a challenge to established social order and often have a violent or bizarre element. He effects radical change through his epiphanies. To the rational ego, he represents a magical, enchanted realm. He is depicted as being always on the move, revealing himself in many different epiphanies, more than any other god in Greek mythology.

Dionysos in antiquity was principally the god of wine and intoxication. In addition, he presided over ritual madness or ecstasy (*mania* in Greek). The mask was a significant symbol of his presence, and thus ancient drama was devoted to Dionysos. Dionysos' nature was to transcend boundaries. The normal, conscious identities of his followers are subverted. His presence is fluid, full of illusion, and contains the opposites. He effects transformation, both negative and positive, from the viewpoint of the human ego.

Though scholars for years thought that the cult of Dionysos originated in Thrace and was brought more recently into ancient Greece, the discovery of the name Dionysos on Linear B tablets from Mycenaean Pylos, dated circa 1250 BCE, indicates that he was present in mainland Greece well before. In Homer's *Iliad*, he is referred to as a "joy for mortals" (*Iliad*: 14.325). And in Hesiod's *Theogony*, he is described as "he of many delights" (*Hesiod's Theogony*: 941). Dionysos is seen in Greek religion as having invented or discovered wine, and given this "ambivalent" gift to mankind, much as Demeter gave the gift of the grain to mankind.

In ancient Greece, wine festivals were held in many areas. The oldest of these seems to be the *Anthesteria*, held in Athens each spring, when the new wine was drunk. It also celebrated the mythic

arrival of Dionysos from across the sea. Other festivals included the performance of tragedy and comedy. Festivals that celebrated Dionysos were characterized by revelry, which included licentious and obscene behavior, the reversal of social roles, and cross-dressing by males. Processions of phalluses were paraded through the streets, though there are no extant depictions of Dionysos with an erection, unlike Hermes or Pan.

While alcohol intoxication is one of the darker aspects of Dionysos' gift to mankind, the ritual madness associated with his myth and cult was not associated with drug or alcohol use. The initiates in his cult, the maenads, were "seized" or possessed by the god. They behaved ecstatically, dancing wildly on remote mountaintops, and their rites were seen as "mad" only by those uninitiated. Most of the participants were women. In vase paintings, Dionysos and his followers tear apart live animals with the bare hands and eat them raw. We do not know if this actually occurred as part of the cultic practice; however, it reiterates the tearing apart of the young Dionysos by the Titans.

The worship of Dionysos had a very important psychological function. It emphasizes the value and importance of excess. In allowing for the suspension of the structures of everyday life, it enabled individuals to contact the darker, more irrational aspects of their nature in a ritualized way; to let go of ego control and space/time constraints and engage in mystical experience; and thus to have access to the deeper nonego realms of the psyche, what Jung calls the Self, for the purpose of inner transformation. His rites promoted the dissolution of differences and the experience of a primordial unity with others, with nature and the mystical realization that life and death are one.

Thus, we see that Dionysos was also associated with death. Heraclitus, the fifth-century philosopher, famously said that Hades and Dionysos are one. His myth includes a story of descent to the underworld to bring his mother Semele back from Hades. Tombs were very frequently decorated with Dionysos and his maenads in the ancient world.

From a psychological perspective, it makes sense that Dionysos is associated with death, because the ecstatic, transgressive experience he

brings happens through the temporary suspension of ego functioning and individual identity. Dionysos brings an otherness of experience. He is considered the most epiphanic of all the Greek gods, bringing metamorphosis and transformation. For those who bring a negative attitude, it is a dark, frightening experience, but for those who bring a positive openness, it is transcendent.

Disability

Benson A. Mulemi

Unit, The Catholic University of Eastern Africa,
Nairobi, Kenya

Disability refers to a debilitating condition and the lived experience of physical and mental incapability, infirmity, handicap, or impairments. Professional, academic, political, and sociocultural

philosophies shape varying and often-conflicting meanings of disability. The denotation of disability therefore varies from culture to culture, but the meaning of the concept is not limited to notions of optimum physical and mental functionality. Social, religious, and moral considerations of physical or mental attributes, for instance, may result in people being considered disabled in certain contexts despite being able to function without particular difficulty in their daily lives (Bruce 2010, p. 255). Proliferation of social, functional, medical, embodiment, cultural, relational, and the human rights models of disability and associated interventions characterize the array of competing definitions of the concept (Goodley 2011; Gupta 2011). While disability may entail objective definition of constrained functional incapacity, associated infirmities are subjectively constructed notions of *disablement* and *ableism*.

Disability, Disablement, and Ableism

While disability may be an objective medical problem affecting an individual, sociocultural matrices influence lived experiences of the condition and help-seeking trajectories. Intersubjective experiences of objective physical or mental disability mediate individual and collective responses to infirmity. Wider societal circumstances couple with disabling social values in determining the degrees of disablement and the social distinctions between the able bodied and the handicapped (Oliver 1990; Thomas 2007; Priestley 1998). Ableism is therefore a form of social exclusion label in conceptualizations of disability.

Society distinguishes the extent of human physical, mental, and social abilities and disabilities. This distinction relates to cross-cultural constructions of “the other,” which contributes to discrimination, isolation, or stigmatization of people perceived to have inferior physical and mental capabilities. Ableism is in this sense a social label that creates awareness of stigma, discrimination, and occasional ill-treatment. This in turn contributes to the tendency among people with perceived disability to either withdraw or isolate themselves

from normal social life. Sociocultural labels of normalcy, abnormality, and disability bring to question the personhood of some society members, and this aggravates ontological, existential, and emotional anxieties.

Personal difficulties associated with disability have complex psychosocial, spiritual, and physical dimensions. Systems of belief and thought and psychological orientations and relative access to resources for coping with subjective and objective consequences of impairment and handicap mediate the lived experience of disability. However, a wide spectrum of personal experiences and varying societal perspectives influence cross-cultural conceptualization of disability (Staley 2012). In addition, conditions that cause physical difficulty feature in the perceived causes and consequences of disability, as well as the social and spiritual perspectives on related personhood. Cultural notions of deformity or human wholeness further determine the impact of disability on the daily life experiences of affected individuals and their families (Garland 1995). Conceptualizations of disability and the outcomes of disablement, ableism, or disablement are also relational and relativistic and reflect subjective culture-bound experiences (c.f. Turner 2006, p. 3). Disability in this sense entails lived experience which should be understood in terms of the interaction between affected people’s functional status and their physical, cultural, and social welfare policy situations. The matrix of impairment and handicap creates disability as a relative social phenomenon rather than an entirely personal tragedy and pathology (Goodley 2011; Livingston 2005).

Relativity of Disability

Sociocultural contexts of personhood, normality, abnormality, and definitions of optimal human health point to the relative concept of disability. Its definition may reflect organizational requirements of governments, welfare professionals, and rehabilitation institutions for the identification of welfare service beneficiaries (Goodley 2011; Lutz and Bowers 2007). A person with disability in this sense is anyone with a physical or mental

impairment that may cause a significantly enduring impediment to perceived normal capacity to participate in day-to-day personal and societal activities. However, Physical and mental deficiencies that constitute disability may essentially be either congenital or acquired through illness or life course misfortune.

Disability reflects both subjective personal and objective experience of impairment that inhibit physical and social functions. Social and cultural labels of normal and able-bodied persons further determine the experience and outcomes of disability. These aspects account for the use of *impairment* and *handicap* as nuanced synonyms in disability studies (Falvo 2005). The World Health Organization (WHO) adopted the term impairment to refer to the loss or abnormality of psychological, physical, or anatomical structure or function at the psychosomatic system or organ level. However, impairment conditions may or may not be permanent and may or may not result in real disability as objective pathology. The WHO therefore delineates disability as personally experienced activity constraint attributed to impairment. Conversely, *handicap* refers to the individual disadvantage that results from impairment or disability and limits fulfillment of a role or realization of a goal (World Health Organization 1980). Culture-specific etiologies of physical and mental impairment mediate further the notions and experiences of disability.

Cross-Cultural Disability Etiologies

Cross-cultural disability etiologies focus on the phenomenon as both personal and collective tragedy embodied in physical and mental impairment (Goodley 2011). Scientific and indigenous notions of causes of disability coexist in modern societies and shape considerations for psychosocial and physical treatment and rehabilitation strategies. Traditional and contemporary societies globally tend to locate the origins of disability crises within the individual as part of wider social and spiritual realms. A moral perspective that presents disability as an embodiment of individual or

intergenerational wrongdoing or sin is ubiquitous in traditional belief systems and thought worldwide.

Perceptions of magico-religious origins of disability account for the widespread beliefs that link disability to supernatural admonition or retribution. This etiology accounts for resorts to help-seeking behaviors involving appeals to divine intervention through religious rituals (Goodley 2011, 2000; Selway and Ashman 1998; Hayhoe 2014). Many traditional non-western and western cultural beliefs that associate disability with mystical embodiment of either blessings and piety or curses and moral shame abound (Buscaglia 1975; Bruce 2010). Among the traditional African societies, children with disabilities are perceived as symbols of bad omen and were eliminated through infanticide in the past. Families share disability-related disgrace of kin through filial bonds. This attitude contributes to overt or subtle discrimination of people with disabilities. The social exclusion may extend to entire families depending on the magnitude of the perceived disability and the nature of shame and embarrassment it causes. Efforts to conceal disability often result in social isolation, human rights violations, and emotional distress among persons with disabilities and their families.

Cross-cultural traditional belief systems and thought have room for narratives on undeserved personal and collective misfortune. This constitutes psychological solace in instances where personal or familial culpability for disability is contested or unproven. Impairments and handicap attributed to perceived machinations of evil supernatural powers and their agents, such as witches, sorcerers, magicians, fastidious ancestral spirits, and the devil in world and traditional religions, are in this category of disability. In traditional Islamic societies, for instance, people with disabilities are believed to be victims of *jinn* affliction and acts of witchcraft, yet the *jinn* could also be a benevolent spiritual agent (Hayhoe 2014, p. 252). Religious and superstitious disability etiologies and related lived experience of resultant conditions entail conflicting views and contradictions about the personhood and identity of people with impairment or handicap.

Disability and Personhood Ambiguity

Magico-religious and scientific perspectives on disability causality may account for both obvious and unspoken misgivings about the personhood of handicapped people in different societies (Priestley 1998). Religious traditions worldwide present twofold interpretation of disability. The categories of disability characterize ambivalent responses to the predicament of handicap or impairment. The first disability category involves interpretations of impairment that is associated with sin, evil, moral infamy, failure of faith, and personal culpability. In the second place, cross-cultural constructions of disability may present impairment as the embodiment of mystical enhancement of other capacities despite a perceived functional inadequacy (Barnes and Mercer 2003; Goodley 2011) and spoiled or stigmatized identity (Goffman 1997).

Contemporary and traditional societies may link perceived disability with intrinsic endowments elaborated in both religious and mundane psychological discourse on giftedness and its embodiment. Popular myths and beliefs in African cultures, for instance, underscore the perception that impairment and a disability of one human sense may herald mystical perfection of other capabilities. Similarly, Christian theological interpretations of intellectual disability manifested in speech disorder, for example, affirm the paradox of perceived disability offering the opportunity to transcend the realm of the perceptible world (c.f. Staley 2012, p. 399). This theological perspective suggests that intersubjective disability experiences may contribute to the discovery of spiritual knowledge and other abilities that are not accessible through social ableism and disablement.

Religious appreciation of the atypical person provides insights for a paradigm shift from negative religious attitude toward disability. This entails change of disability models from fixed association of impairment with moral problems and spiritual admonitions. Christian theological discourse and religious practice that point to the alternative construction of disability as divine human experience exemplify the paradigm shift (Eiesland 1994). Some religious belief systems

also link disability with spiritual relationship with God or other supernatural agents. Perceived physical and mental impairments may therefore be understood as evidence of spiritual embodiment (c.f. Goodley 2011, p. 7), which characterize cross-cultural fascination about some human anomalies and extreme veneration, sympathy, or stigma for persons with the disability (Bruce 2010). Cross-culturally, secular and spiritual perspectives on disability relate distinctive physical, mental, and emotional attributes with subjective experience of abnormality.

Different cultures and religious traditions associate impairment or handicap with spiritually transformed or polluted personhood. Visible disability in this sense contradicts conventional notions of archetypal personhood at two levels. First, disabilities personify both capricious evil and benevolent spiritual power. Second, disability traits may be interpreted as a symbol spiritual giftedness and special skills repertoire that can be harnessed to augment human security, power, and prosperity. Similarly, anomalous bodies and personalities have elicited ambivalent responses throughout human history: as omens or prodigies, visitations of sin, freaks, and curiosities and as inducing mockery, embarrassment, or compassion (c.f. Turner 2006, p. 1). Responses to perceived disability and actual functional impairment necessitate objective treatment and psychosocial coping strategies.

Psychosocial Coping with Disability

People with disability and their families strive to make sense of the disability experience (Kamei 2014) and seek ways of engaging in every day social activities and realizing their goals with relative ease. While professional treatment and rehabilitation interventions may alleviate the physical limitations of disability, affected people also pursue remedies for psychosocial strain. Religious and social values strengthen psychological defense mechanisms, which contribute to means of coping with adverse consequences of disability. Religious traditions may offer positive perspectives on disability, which alleviate the physical and psychological burden of impairment. The

fact that some cultures construct physical and mental impairment as embodiments of spiritual or divine acceptance of the victim offers religious coping and sensemaking mechanisms. The perceived linkage between disability and either increased faith or test of forbearance in Christianity and Hinduism, for instance, facilitates coping and resilience despite subjective or objective functional impairment.

People with disabilities and their caregivers may turn to religion in pursuit for existential meaning and purpose in life. Similarly, spiritual truisms and rationalization mediate psychological coping strategies by offering socially and personally acceptable reasons for thinking positively about debility and inevitable stigma. Spiritual discourse eases disappointment of unrealized aspirations and constrained functioning and prompts empathy and support for the cross-cultural value of unconditional care for disadvantaged persons (c.f. Falvo 2005, p. 7). Christian spirituality of disability, for instance, reflects an image of empathy and the acceptance of physical imperfection as being central to the message of care (c.f. Hayhoe 2014, p. 251). Religious values of solicitude alleviate marginalization and oppression linked to ableism and personhood ambiguity that disability may engender. Religious discourse admonishes unkindness to persons with disability and diverts unacceptable feelings or ideas into socially acceptable behaviors (Falvo 2005).

The psychological defense mechanism above may militate against withdrawal and isolation, which would aggravate disorders such as depression among persons with disability. Spiritual support redirects emotional energy among persons with disability and the able-bodied people toward constructive care and rehabilitation activities. This approach to disability can boost self-esteem among affected people as they pursue social inclusion. Religious beliefs that underscore the virtue in embodied debility strengthen positive thinking and coping with impairments and handicap. Disability causes stress and psychological disequilibrium, but attributing the perceived anomaly to the will of God or spiritual forces beyond human control assuages emotional and social suffering. Religious coping strategies

provide psychosocial recourse for mental stability, patience, and forbearance regardless of the ambivalence of disability in human experience (Gupta 2011). Christian, Hindu, and Muslim traditions, for example, have interpretations of disability as capricious divine choice and favor. Infirmary may symbolize special divine relationship with God and the transcendent realm. Similarly, some religious systems support the acceptance of disability as either a positive spiritual experience or a test of faith, rather than divine retribution (Goodley 2011; Gupta 2011).

Conclusion

Cross-cultural conceptualization of disability underscores the complex mind-body-soul paradigm for understanding human well-being. Disability educes both personal and objective experience of psychosomatic impairment and handicap, which vary with cultures. Religion is therefore an important dimension of the disability experiences since spirituality shapes the meaning of handicap and impairment and defines intervention recourses. Paradoxically, religious beliefs contribute to both disability-associated stigma and resilience against stressful events associated with impairment (Selway and Ashman 1998). The cross-cultural tendency to venerate, marginalize, exclude, and even oppress persons with disabilities entails the pursuit for comprehensible psychological, social, and spiritual perspectives on intersubjective construction of the atypical person.

Discernment

Elisabeth Koenig
 Ascetical Theology, General Theological
 Seminary, New York, NY, USA

Introduction

To discern means to separate or distinguish between or among things. In religion, generally speaking, discernment, sometimes called discernment of spirits, means skill in discriminating between those influences that enhance or lead to a fuller relationship with God or transcendent reality or, where no belief in transcendent reality is held, to fuller appropriation and implementation of one's value system. Psychologically, discernment is an intentional practice which develops the ability to act in accordance with those agencies that are conducive to integration of the personality and which avoids or resists those influences that would bring about psychic fragmentation or disintegration. For the purposes of discernment, influences within the subject, such as dreams, images, and thought processes, or without, such as relationships with others and political or social context, are understood to have equivalent value and effect. Although meanings vary among traditions, discernment may be characterized as a process that encourages seeing clearly enough to make well-considered decisions which take into account and integrate the multiple dimensions of life, i.e., intellect, affect, body, relationships, principles, values, work, income, expenditures, play, creativity, and religious community, with a particular concern for God, transcendent reality, or a unique system of values. Moreover, discernment's clarity of vision is most often linked with detachment from the promptings of inordinate desire which muddy the waters and make clear discernment unlikely or impossible.

Research into discernment can play an important role in today's debates about the nature of religious experience, especially where a tension is felt between the individual and the collective, the mystical and the prophetic, or the personal and the political. Eschewing an isolating emphasis on

personal experience, the process of discernment is understood to unite dimensions of the human witness that are, *at once*, objective and subjective, e.g., historical, textual, moral, theological, aesthetic, political, economic, and communal, *and* personal, psychological, visionary, spiritual, particular, and perspectival. The interpretative strategy called discernment predisposes individuals both to appropriate for themselves and to contribute to the meanings of the historical and communal realities of which they are a part.

Judaism

Discernment is a biblical term with a long and complex history. In the Old Testament (Hebrew scriptures), King David was reputed to have a divine gift of discernment: a wise woman of Tekoa exclaimed of him, “The word of my lord the king will set me at rest; for my lord the king is like the angel of God, discerning good and evil” (2 Sam. 14: 17). Job claims discernment for himself: “Is there any wrong on my tongue? Cannot my taste discern calamity?” (Job 6: 30). The Lord, when worship of him has become superficial and empty, threatens to punish the people by taking away a self-professed but false ability to discern: “The wisdom of their wise shall perish, and the discernment of the discerning shall be hidden” (Isaiah 29: 14). Finally, and of great significance for our discussion, wherever several different Old Testament prophets professed to speak for God and disagreed with each other, the ancient Hebrews recognized that a moral and spiritual awareness which could distinguish between the authentic and the counterfeit was of utmost importance. Among the prophetic books, Jeremiah focuses the most on the problem of discernment because his witness to God was more directly contested than that of the other prophets. Thus the classic discussion of the criteria for critical discernment of prophetic authenticity is in Jer. 23: 9–32, where false prophets are identified by their worship of false gods, including Baal, their promise of good news rather than judgment, false claims to have received a word from God or to have had visions or dreams, immorality, and

absence of counsel from the Lord (Moberly 2006).

Christianity

Although the New Testament gospel narratives depict a process of discernment whenever a decision for or against God or Jesus is made and when demons are cast out by the power of God incarnate in Jesus (cf. *inter alia*, Mat. 8: 31; 12: 28; Mrk 3: 22; 16: 9; Luke 4: 33; 8: 2; 8: 35, etc.), they do not develop the meaning of the term. However, there are passages, like Matt. 5: 8, “Blessed are the pure in heart for they will see God,” which suggest that the topic was uppermost in these authors’ minds. More to the point, the First Letter of John enjoins, “Beloved, do not believe every spirit, but test the spirits to see whether they are from God; for many false prophets have gone out into the world” (4: 1). But it is Paul, more than any other New Testament author, who explicitly engages the concept of discernment, and he does so for the sake of building up the community of the church. For Paul, discernment (he uses several different words to denote the process: *dokimazein* = one-self out in practice; *diakrinein* = discern; *anakrinein* = discern, examine; *aisthesis* = discernment, perception) is a gift of God’s Holy Spirit (1 Cor. 12: 1–11). Paul makes a distinction between the “unspiritual” (*psychikos*) and the “spiritual” (*pneumatikos*), where the “unspiritual” would have natural abilities not specifically related to the agency of the Holy Spirit: “Those who are unspiritual do not receive the gifts of God’s Spirit, for they are foolishness to them, and they are unable to understand them because they are spiritually discerned (*anakrino*)” (1 Cor. 2: 14). Moreover, Paul links discernment with love: “And this is my prayer, that your love may overflow with knowledge and all discernment (*aisthesis*) to help you determine what is best” (Phil. 1: 9). (Loving as a prerequisite for accurate knowledge or discernment became a favorite theme among medieval theologians.) Finally, for Paul and the patristic authors who interpreted his letters, Christian discernment hinges on a felt participation in the paschal mystery: it is believed

that true discernment only happens when a situation is viewed through the lens of the cross of Jesus. This ability is enhanced through dramatic reading of the gospel narratives and through participation in the Eucharist. Paul speaks of baptism into Christ's death as the condition for Christian adulthood (Rom. 6: 5 f.). Practically speaking, discernment as governed by the cross means that Christians try, by God's grace, to neutralize the natural effects of envy and strife with a spiritual humility that graciously gives up its own will, desire, or honorific place to the other. Moreover, there is a spiritual seeing, or discernment, that accompanies such submission (Johnson 1983; McIntosh 2004; Moberly 2006).

The patristic period saw a real flowering of the concept of discernment. *The Life of Antony* by Athanasius (c. 295–373) shows Antony out in the desert, struggling for decades with demons who have tried to compromise his relationship with God. In time, these external entities came to be viewed more and more psychologically as dynamics within the soul. For example, Evagrius Ponticus (346–399) in his *Praktikos* and *Chapters on Prayer* speaks of “eight evil thoughts” that afflict monastics and need to be overcome by prayer and other spiritual practices, such as fasting and vigils. John Cassian (c. 365–435), while believing with his predecessors that both good and evil spirits really exist, is more interested, in his *Conferences*, to teach his monks that the near objects of discernment are not actually external spirits, but movements within the soul, like thoughts, images, feelings, and judgments. For Cassian, discernment is a coming to terms with these inner movements that results in a state of equilibrium, as it did for Antony, Origen of Alexandria (c. 185–254), Evagrius Ponticus, Diadochus of Photike (mid-fifth century), and many others (Sweeney 1983). Theologians of the medieval period were also drawn to the discernment tradition. Julian of Norwich, for example, in her *Book of Showings*, correlates discernment with growth in contemplation (Koenig), and Catherine of Siena's *Dialogue* is replete with teaching on discernment. For Thomas Aquinas, the concept of discernment gives way to an emphasis on prudence which relies more

heavily on the rational faculty and is less integrative than discernment.

But it was left to Ignatius of Loyola (1491–1556) to gather together the patristic teachings on discernment and codify them in usable form. His *Spiritual Exercises*, which are decisional and concern the discernment of religious vocation, are the *locus classicus* for Christian training in discernment. In the form of a 4-week retreat, the training progresses through stages of purgation and sorrow over sin to the “contemplation to obtain love” in the 4th week where the retreatant sees all of creation as God's expression of love to his creatures. With a profound sense of giftedness and acceptance of a God-given liberty or free will, that person is encouraged to return the gift to the giver through cultivating an attitude of magnanimity toward God who is dedicated to serving him. Most distinctive of Ignatius' teaching on discernment are the two sets of the so-called Rules for the Discernment of Spirits, appended to his *Spiritual Exercises*, in particular the suggestions made there concerning the felt alternation between states of “consolation” and “desolation.” These are technical terms in Ignatius' vocabulary, referring to the raw material that people must judge through if they are to make an appropriate choice. He describes “consolation” as “that which occurs when some interior motion is caused within the soul through which it comes to be inflamed with love of its Creator and Lord.” It includes “tears of grief for one's own sins,” and “every increase in hope, faith, and charity, and every interior joy which calls and attracts one toward heavenly things.” “Desolation,” by contrast, Ignatius calls “everything which is contrary [to consolation]; for example, darkness of soul, turmoil within it, an impulsive motion toward low and earthly things. . . . These move one toward lack of faith and leave one without hope and without love. . . .” Discernment, then, is a process of keen observation of these affective states that leads to deep familiarity with both their energy for integrative authenticity and their potential for disintegrative deception. Most important, for Ignatius, discernment enables individuals to recognize and avert the beclouding influence of inordinate desires (*afecciones desordenadas*).

Islam

Discernment is a central concept in Islamic tradition, although the term does not appear in English dictionaries and encyclopedias of Qur'anic terms and concepts. The word *furqan*, usually translated as "criterion" or "distinction," conveys the notion of one thing as set apart from another. Both the Hebrew *Torah* and the Qur'an are referred to as *furqan* (the former in *Qur'an* 2: 53 and 21: 48; the latter in 3: 4 and 25: 1) because each book was revealed in order to assist human beings in their judgment of the difference between truth and falsehood. Muslims believe that, at the last time, there will be a decisive victory after which truth will reign in a manifest and uncompromised form. In Islam, the concept of discernment is also conveyed by the notions of "guidance" (*huda*) and "misguidance" (*dalah*). God is the only source of guidance (2: 120; 7: 178) in that God shows the human being both the right and wrong paths, leaving him or her free to choose between them (76: 3). Guidance comes in three forms: *instinctual*, where God has given the human being an instinctual sense of "its evil and its good" (91: 8); *rational*, where God-given reason enables one to consider rationally one's place in the universe; and *revelatory*, an infallible guidance bodied forth in both the *Torah* and the *Qur'an*, although the latter is understood to provide the best guidance (17: 9). "Misguidance" also takes place at God's behest, but God only misguides those individuals who already have chosen evil. In a sense, they have asked for misguidance, and God obliges them by misguiding them in order to punish them for their sins (7: 155) (Mir 1987).

Sufi tradition especially emphasizes a process of discernment. Here human beings are viewed as microcosms of the cosmos so that there is a correspondence between them and all the levels of existence, including the Divine Reality beyond the cosmos. Muhammad said, "There are seventy thousand veils of light and darkness that separate us from God, and they constitute the universe," and "The person who knows himself/herself knows his/her Lord." Thus, the "goal of the

spiritual life is to be able to lift up the veil of outwardness so as to behold the inward and subsequently come to know the outward in light of the inward" (Nasr 2007, p. 49). This is a process of ever-deepening interiorization, for the veils only will become transparent to the reality beyond them after a person has penetrated to his or her own center and lifted the veils within. The inner vision, which results from God's guidance and one's faithfulness to devotional practice, ultimately will be able to distinguish the real from the counterfeit at every level of the cosmos.

Psychological critique. Psychologically, discernment denotes an intentional process that seeks to render unconscious material available to consciousness for the sake of making healthful and appropriate decisions. For example, it is possible to pose a series of questions about an issue to be discerned, or about a dream, to see what "comes up," thus becoming more self-aware and capable of making choices that suit who one really is, rather than what others expect one to be (Wolff 1993; Gendlin 1986). The result can be that energy is released, healing made possible, and integration facilitated. However, such a discernment process is never easy: one's conscious attitude dominates every effort to interpret anything. The unconscious always remains unconscious, and the capacity for self-deception is infinite. Therefore, most people interested in discernment these days speak of the need for well-seasoned spiritual directors, and communal discernment is preferred to a process undertaken in isolation. Moreover, increasingly, there are applications of classical discernment practices and traditions to political and corporate situations (Brackley 2004; Libanio 1982; McClain 1988; Urena 1979; Delbecq et al. 2002).

Various schools of psychology offer ways to evaluate what is going on in discernment. For example, the attempt has been made to correlate the Ignatian *Rules for Discernment* with stages of ego development, with highly suggestive results (Liebert 1992). Jung's notion of the progression and regression of psychic energy assists our understanding of consolation and desolation, the former signaling the uprush of energy and

heightened awareness following successful appropriation of a previously unrecognized psychic content and the latter indicating the loss of psychic energy that occurs when there is a retreat into the unconscious in order to discover or retrieve hidden psychic potential. Desolation may be equivalent to psychological deflation when it provides a corrective to inauthentic consolation (i.e., inflation). Thus consolation and desolation operate in contrary or compensatory relationship and in this way impel forward the process of individuation or spiritual development (Sweeney 1983). Cognitive psychology's labeling of cognitive distortions, such as "all-or-nothing thinking," "overgeneralization," "mental filters," and "disqualifying the positive" (Burns 1980), has parallels with ancient and medieval descriptions of the effects of evil spirits, or thoughts, and its method of talking back to these and proposing alternatives has much in common with ancient practices (Ponticus 1981) and Ignatius Loyola's method depicted in his *Autobiography* and *Spiritual Exercises*. Self-psychology can make a very special contribution to understanding what is necessary for authentic discernment, especially in its insistence on full, conscious mourning for what has been lost in life as a prerequisite for "analytic access" to the dynamics of the unconscious and, hence, for a self-knowledge that approaches accuracy (Homans 1989). Finally, systems theory, with its insistence on grasping how the role one has been assigned by one's family of origin, conditions one's perception of all reality, its distinction between the "thinking process" and the "feeling process," and its strategies for encouraging differentiation, all offer clarification for undertaking a psychologically well-informed process of discernment (Kerr 1988).

Dismemberment

Alice Mills

University of Ballarat, Ballarat, VIC, Australia

Definition

Dismemberment means the taking apart of a body and the removal of one or more body parts. At one end of the scale is the tearing apart of a whole body, resulting in death, as in stories of the early Christians being fed to the lions and Greek myths about the tearing apart of Dionysus by the Titans. The other end of the scale is harder to determine. Forcible removal of eyes, as in St. Lucia's decision to take out

her eyes to discourage her pagan suitor, probably counts, but does either castration, as in Origen's self-castration "for the kingdom of heaven's sake" (Matthew 19:12), or circumcision, as enjoined on the Jews in the Old Testament? Bodily injuries such as the piercings and flagellation wounds of penitents and the scarification of Australian Aborigines undergoing initiation do not involve the removal of a body part and hence should not qualify as dismemberment nor should such phenomena as stigmata manifesting on the palms and feet of some saints.

Bodily Wholeness

With the obvious exception of the loss of body parts that occurs accidentally, or for medical reasons, or in secular hostilities, dismemberment of the living is generally understood in a religious context as indicating the presence of a deity or dedication to the service of a god or a ritual of initiation. Opposing this tendency, however, is the emphasis on whole bodies without blemish where service to a deity is concerned. In the Bible, for instance, the Book of Numbers abounds with instructions that animals chosen for sacrifice must be "without blemish," and in Leviticus the same requirement is made for priests:

And the LORD spake unto Moses, saying,

Speak unto Aaron, saying, Whosoever *he be* of thy seed in their generations that hath *any* blemish, let him not approach to offer the bread of his God.

For whatsoever man *he be* that hath a blemish, he shall not approach: a blind man, or a lame, or he that hath a flat nose, or anything superfluous.

Or a man that is brokenfooted, or brokenhanded.

Or crookbacked, or a dwarf, or that hath a blemish in his eye, or be scurvy, or scabbed, or hath his stones broken (Leviticus 21:17–20).

Christianity

For Christians, the wholeness of the body has been important in the case as I had it of priests but also for each human being after death, as the body awaits its resurrection and the Last Judgment, hence the Catholic Church's centuries-

long ban on cremation. As Michael Bryson points out, the biblically based Christian understanding of Jesus as head of the Church, which is the body, reiterates the great importance of wholeness. Schism and heresy function as the dismemberment of the body spiritual.

In this context, the fate of Christian saints both before and after death is paradoxical. After death, some saints' bodies have been dismembered to provide relics for as many altars as possible – sometimes, many more substantial body parts than any human body could possibly provide. Before death, violent acts of dismemberment have become emblematic of sanctity for those saints who were also martyrs, as with St. Oliver Plunkett (whose head can be viewed in Drogheda) or St. Bartholomew, who was flayed. The bodily sufferings of the martyrs are considered an *imitatio Christi*, willingly undergone with Jesus' sufferings and death as their model. These sufferings of Jesus before and during crucifixion, including flagellation and the piercing of his side, do not constitute dismemberment. It is, however, theologically debatable whether, for those branches of Christianity that believe in transubstantiation, the breaking and eating of the host constitutes a form of dismemberment.

Ancient Egypt

While Jesus' status as a dismembered god is disputable, there are abundant examples in other near eastern and classical religions. The most prominent of these deities is the Egyptian Osiris, whose body was taken apart by his jealous brother Set and pieced together by his devoted wife Isis (his penis was irrecoverably lost). The dismembered and re-membered god of fertility and civilization then became lord of the dead, and the mysteries of Isis promised their initiates a similar resurrection to eternal life. The practice of mummification in ancient Egypt was performed to ensure eternal life by keeping the physical body as intact as possible. While some mummified bodies appear to have been dismembered, interpretation of this procedure is much debated: were the spirits of the

dead being urged to depart, was the mummification done poorly, or was this deliberate dismemberment in honor of Osiris' fate?

Shamanism

The experience of being dismembered, though not its literal enactment, is a well-attested part of the Siberian shaman's initiation into spiritual power as he gains access to the worlds above and below. To become a shaman is to experience, while still a living human being, the dismemberment and resurrection of a god.

Punishment

Dismemberment before death, for a human body, is thus in a religious context usually a mark of closeness to the divine. Such closeness is not always a mark of divine favor, however. In Greek myth, offending a god can result in being torn apart by the god's possessed followers, as in *The Bacchae*, or falling and being dragged behind a hurtling chariot to one's death, as in *The Hippolytus*. Dismemberment after death is an indication of the deities' disfavor. For the ancient Egyptians, the sunboat carried the dead to the hall of judgment, but along the way the wicked would be taken, torn apart, and eaten by monsters. The carefully gradated horrors of Dante's Christian hell include the splitting apart of bodies that then grow back together, only to be resplit, and the incessant devouring of the skull's contents. Buddhist hells are similarly stratified with punishments such as having one's eyes gouged out or being disemboweled.

Psychoanalytic Theory

Psychologically, dismemberment of the body, whether of oneself or another human being, or the urge towards dismemberment, is considered a symptom of serious mental illness. There is no scope for the interpretation of dismemberment as part of a spiritual ascent or as penitential self-

sacrifice in current psychological models of the world. Psychoanalytic theory is more hospitable to the concept of dismemberment. For Melanie Klein, the infant splits the mother into “partial objects,” representations that must be combined for the child’s psyche to become whole. For Lacan, human beings’ sense of their own identity is founded on a false equation in the mirror phase which entails that ego consciousness is always unauthentic. Psychic integration is thus impossible, and early ego development includes fantasies of castration and dismemberment. While Klein and Lacan postulate a sense of the body as split in the young child’s psyche, in *Totem and Taboo* Freud postulates the long-ago dismemberment of an actual body as the origin of human civilization. He asserts as literal fact the story of the primal horde in which the sons, eager to gain access to their father’s women, slew him and ate the flesh they had torn apart. It is guilt at this primal murder and cannibal feast that still powers human civilization, according to Freud. The dismemberment that for many devout Christians and initiates into the mystery religions has borne a joyful message of resurrection to eternal bliss is for these psychoanalytic theorists in their different ways an uncanny substratum to all human beings’ understandings of who we are and can be in this world.

Dissociation

Jessica Mitchell
New York, NY, USA

Introduction

Dissociation is a normal part of the psyche’s defensive process, severing connection between categories of mental events that are normally integrated. Streams of thought or consciousness are kept apart and communication between them is restricted, resulting in a discernable alteration in thoughts, feelings, or actions.

Dissociation is an unforeseen partial or total disruption of the normal integration of conscious functioning, a means by which typically integrated streams of thought or consciousness are segregated and resulting communication restricted. This default defense can take place as a consequence of repeated or overwhelming trauma. The ability to dissociate can begin with self-hypnotic declarations such as “I am not here; nothing is happening to me. I am not in this body.” This deceit then becomes a structuring dynamic within the personality (Mollon 2002).

Historically, dissociative states have been associated with psychological and physical trauma, healing practices, and religious experience in nearly every culture. Dissociative states have knowingly been reached by hypnosis, meditation practice, prayer, and shamanic practice. Ritualistic behavior during worship or meditative practice can allow the individual to enter into both overt

and implicit dissociative states. Those held hostage or in captivity develop trance capabilities and become adept in the practice of dissociation during isolation and confinement (Herman 1992; Van der Kolk et al. 1996).

For more than a century, the effects of pathological dissociation have intrigued clinicians. The emergence of distinctive dissociative disorder diagnoses is closely intertwined with the development of contemporary psychiatry. More than a century ago, Janet (1889) is credited as the first to identify this essential pathology, alternation in consciousness, as “dissociation.” Breuer and Freud (1895/1955) followed by defining these same altered states as “double consciousness.” Both Janet and Freud concluded that unbearable emotional reactions to traumatic events produced an altered state of consciousness, which in turn induced hysterical symptoms. Both recognized the essential similarity of altered states of consciousness induced by psychological trauma and those induced by hypnosis (Herman 1992).

Janet asserted that memory is an act of creative integration by which we encoded and characterize experience into preexisting cognitive schemata. When an event in the life of an individual is too overwhelming to fit into these already existing schemata, he believed that it was split off from consciousness into separate systems of subconscious “fixed ideas,” untouched by the rest of individual experience. Individuals with hysteria were those who had lost the ability to integrate the memory of overwhelming experience (Daves and Frawley 1994; Herman 1992; Janet 1889).

From an etymological perspective, the word dissociation is derived from “dis” which means split two ways or “in twain” and is comparable to the Greek “dia” as in “diabolic” – the opposite of “symbolic.” There is moreover an implication of negation or “reverse,” undo a spoil as in discount, disown, or disable, and the notion of “to strip off” or “expel from” as in disbar, disenfranchise, and disempower. In Latin compounds, “dis” was commonly the reverse of “com” or “con” as in concord versus discord. Another meaning is to render a whole into parts, therefore the sense of apart, away, and asunder, as in disperse, dissident, distance, and dispossessed. Association is derived

from link, organization, connection, relationship, and bond (Kalsched 1996, 2005, p. 31).

Dissociation is the defensive process that typically results in the loss of interrelationship between various groups of mental processes with an ensuing, nearly independent, functioning of the one group that has been separated from the rest. Dissociative discontinuities can comprise a wide range of phenomena frequently found in both the immediate and long-term response to trauma. Primary phenomena include depersonalization, derealization, identity confusion, and identity alteration. Individuals may experience bodily detachment, numbing, distorted time perception, fragmentation of the coherence of sensory experience, tonic immobility, forms of extreme passivity, disruption of memory, and amnesic states. Finally, in the case of severe trauma, all connection can be severed between an actual occurrence and permanent symbolic, verbal, and mental representation (Bromberg 1998; Daves and Frawley 1994; Mollon 2002; Van der Kolk et al. 1996).

Dissociation exists on a continuum including normal biological forgetting, daydreaming, and abnormal biological amnesia following a concussion to abnormal psychosocial dissociation that coexists with trauma including multiple personality disorder (Putnam 1989; Ross 1989). While this segregation of mental processes from the rest of the psychic apparatus is most often subtle and transpires unnoticed, other more dramatic manifestations of dissociation can occur among child and adult parts of the personality, between true and false self-structures, sane and psychotic parts of the mind, and different phases of life. Dissociation as a defensive strategy can obstruct emergence of coherent meaning in correspondence to the concept of “attacks on linking” (Bion 1959). Learned dissociation can be considered an internal flight response when external flight is not possible (Mollon 2002; Van der Kolk et al. 1996).

In direct contrast to repression, a horizontal division into conscious and unconscious mental contents, dissociative experience involves a vertical splitting of the ego that can be organized and independently functioning. Under dissimilar internal and external circumstances, two or more ego states alternate in consciousness. These

dissociated states remain unavailable to the rest of the personality and, as such, cannot be subject to psychic elaboration (Daves and Frawley 1994, p. 31). However, dissociative states allow external life to go on but at a great internal cost. Psychological sequelae continue to haunt the inner world, making their presence felt in dreams and waking consciousness by way of recurring intrusive images with violent or symbolic content, enactments, flashbacks, enigmatic somatic sensations, recurrent nightmares, anxiety reactions, mental images split from affect, and somatic conditions. Memory has holes; a full narrative history cannot be told by an individual whose life has been disrupted by trauma (Kalsched 2013).

Dittes, James

Nathan Carlin

McGovern Center for Humanities and Ethics,
University of Texas Medical School, Houston,
TX, USA

James Dittes (1926–2009) was the Roger J. Squire Professor Emeritus of Pastoral Theology and Professor Emeritus of Religious Studies at Yale University. He wrote many books and articles. The major topics that he addressed in his work include the vocation of ministry, contemporary western male experience, and theoretical and empirical psychology of religion (Capps and Dykstra 2003). His major books include *The Church in the Way* (Dittes 1967), *Minister on the Spot* (Dittes 1970), *Bias and the Pious* (Dittes 1973), *When the People Say No* (Dittes 1979), *The Male Predicament* (Dittes 1985), *When Work Goes Sour* (Dittes 1987), *The Hunger of the Heart* (Capps and Dittes 1990), *Driven by Hope* (Dittes 1996a), *Men at Work* (Dittes 1996b), *Re-calling Ministry* (Dittes 1999b), and *Pastoral Counseling* (Dittes 1999a). Three of his articles have been particularly influential, two of which have been cited over 150 times: "Effects of Different Conditions of Acceptance upon Conformity to Group Norms" (Kelley and Dittes 1956), "Attractiveness of Group as Function of Self-Esteem and Acceptance by Group" (Dittes 1959), and "Typing the Typologies: Some Parallels in the Career of

Church-Sect and Extrinsic-Intrinsic” (Dittes 1971). Perhaps his most interesting essay is a lesser-known book chapter titled “The Investigator as an Instrument of Investigation” (Dittes 1977). For a more complete listing of Dittes’s publications and a guide to his papers housed at Yale University, see “Books and Articles by James E. Dittes” (Capps and Dykstra 2003). Also see volume 52, Numbers 1–2, of *Pastoral Psychology* for a tribute to his career, as well as Donald Capps’s (2010) “Notice of Death: James E. Dittes.”

Dittes was born on December 26, 1926, and he died on August 24, 2009. In 1994, he was diagnosed with Parkinson’s disease, which slowly progressed until his death. Dittes married Frances Skinner Dittes in 1948, and they had four children together: Larry (born in 1953); Nancy (born in 1954); Carolyn (born in 1956); and Joanne (born in 1958). Larry was born with Down syndrome and died of heart complications in 1959. Dittes and Frances divorced in 1983. Dittes married Margaret House Rush in 1984, and they divorced in 1986. He then married Anne Herbert Smith in 1987, and they remained married until his death in 2009.

Dittes was born in Cleveland, Ohio, and he was the only child of Mary Freeman Dittes and Mercein Dittes. While his father did not graduate from high school, he worked as a carpenter and later taught industrial arts in a high school. Dittes was baptized as a Presbyterian but grew up in a Baptist church because his mother, Mary, was a soloist in the choir. Regarding these biographical facts, Capps (2003) writes:

[i]t has probably occurred to the reader . . . that a December 26 [birth date], a mother named Mary, and a father whose profession was carpentry would send a powerful message to a young boy that he was predestined to walk in the footsteps of Jesus. (Capps 2003, p. 18)

Capps continues:

That the ‘voice’ he heard in church each Sunday was not the authoritative thunderings of a pastor father but the hauntingly beautiful voice of a much-loved mother may also have led some readers to predict, had they known him then, that he would become what he *did* become, one who made a profession (in all senses of the word) of the ministry of care. (Capps 2003, p. 18)

Dittes matriculated at Oberlin College in 1944. But he took a leave from college when he joined the Navy in 1945 to work as a radio technician in the Pacific Ocean during World War II. He returned in 1946 and graduated from Oberlin in 1949 with a major in English and American literature. He matriculated at Yale Divinity School in 1949. After his first year at Yale Divinity School, he took a leave of absence and went to Turkey to teach English. Toward the end of his first year in Turkey, he decided to apply to the doctoral program in the psychology department at Yale University. He was admitted. He received his B.D. in 1955, and he finished his doctoral degree in 1958. Dittes was then appointed to a position at Yale as Assistant Professor of Psychology of Religion. Capps briefly summarizes Dittes teaching career, which spanned 47 years, all of which were at Yale:

From 1955 to 1968 he moved steadily through the ranks of Instructor, Assistant and Associate Professor, and became Professor in 1968 at the age of 42. When he became a full professor with tenure, he was appointed to the Department of Psychology and the Department of Religious Studies. He was Director of Graduate Studies in the latter from 1969 to 1975, and intermittently from 1985–2001, and Chair of the Department from 1975 to 1982. In 1984 his position was renamed Professor of Pastoral Theology and Psychology, and in 2001 was retitled Roger Squires Professor of Pastoral Counseling. (Capps 2003, p. 19)

One can observe that Dittes was quite successful in rising through the ranks and handling the various kinds of demands of academic life.

In “Some Accidents, Coincidents, and Intents,” Dittes (2003) offers an autobiographical account of his vocational narrative. He begins by noting that he did not know the word “psychology” when he matriculated at Oberlin as an undergraduate student. When he finally did take a psychology class in college, it was during his last semester, and the course was taught from a behaviorist perspective (it was a little later until Dittes learned of psychoanalysis). Both behaviorism and psychoanalysis, Dittes notes, came to influence him a great deal.

This newfound interest in psychology prompted Dittes to pursue psychology at Yale Divinity School. But his eagerness for psychology –

whether behavioral or psychoanalytic – was not shared by students or faculty when he began at Yale Divinity School. He describes what psychology was like in those days in theological schools:

The psychology in seminaries during the first half of the twentieth century was not, as in the latter half, the psychology of the clinic, i.e., attentive, in the wake of a depression, a world war, and Sigmund Freud, to the deeper, darker parts of personality, past, individual differences, and individual extremes. It was the psychology of the classroom, educational psychology, i.e., optimistic, attentive to the emerging, the newly born, the grand future—what William James might have been heard calling the healthy minded, except that William James was not much heard or heeded either. Even William James was too probing and too dark. (Dittes 2003, p. 6)

And so Dittes did not really know what to do with his newfound interest in psychology. His solution was, as he put it, to declare a “moratorium” (cf. Erikson 1962, pp. 99–104) – that is, he moved to central Asia Minor to teach English to Turkish boys and, in so doing, he put his vocational struggles on hold (cf. Dittes 1955).

After his 2 years in Turkey, he returned to Yale to finish his B.D. and began working on a Ph.D. in psychology. He found, to his surprise, that his psychological interests were now affirmed in the Divinity School upon his return. The psychology department applauded his efforts to “colonize” the Divinity School, and the faculty of the Divinity School, rather than being threatened, now asked him to become a faculty member. They saw him as a “scout” on their behalf.

Dittes began his career in psychology – both in terms of graduate studies and in terms of research – by employing empirical methods. In time, however, he gradually and reluctantly abandoned empirical research, because he became impatient with the amount of energy required to do empirical research, research, he felt, that offered very little insight. He embraced what he felt to be more meaningful psychologies, such as those offered by Sigmund Freud, C. G. Jung, William James, and St. Augustine. As he forged his new identity, he came to name his vocation as psychologist/religionist, a combination, as it

were, of his training in theology at Yale Divinity School and his training in the psychology department at Yale University. This title – psychologist/religionist – was, as he puts it, “clumsy, but accurate” (Dittes 2003, p. 9). He also came to refer to his vocation in various ways, such as “theological anthropology,” “pastoral theology,” and “pastoral psychology.”

In all his years of training, Dittes notes that he did not have a formal course in pastoral counseling, that he did not have any training in Clinical Pastoral Education (CPE), and that he had not even heard of Carl Rogers until he began teaching his own courses in pastoral care. He also recalls that although he gave the keynote address at the founding meeting of the American Association of Pastoral Counselors (which took place in Houston, Texas in 1966), he was not, at the time, eligible for membership because he did not have the appropriate credentials. And this seems to connect nicely with some of Dittes’s own convictions about psychology of religion and pastoral theology: Can one ever be “credentialed” to work in this area? Doesn’t the very idea of credentialing seem to assume that there is a standard body of knowledge that one needs to know? Dittes is skeptical of this point of view.

Dittes believes that there is no such thing as progress in psychology of religion, that there is, in other words, no accumulated knowledge. He writes:

There is no knowledge being accumulated. The occasional attempt to manufacture an accumulation or tradition only proves the point. I came to realize that this is not a collective flaw which we all should repent and correct. This is a merit and strength of those of us who work in some version of psychology and religion. This tentativeness, this everyone-needs-to-start-fresh custom, reflects the way things are. (Dittes 2003, p. 13)

“It’s not just that there isn’t accumulation and tradition,” Dittes writes. It is that “[t]here can’t be” (Dittes 2003, p. 13). Why? Because in matters of religion and psychology, there cannot be closure and codification, for “[t]here is always more than meets the eye” (Dittes 2003, p. 13). He continues:

It is an important discovery that psychology of religion deals with matters that require—not permit, but require—regular return to the foundations of experience for correction and renewal and perspective. It is in the nature of things that meaningful psychology of religion requires—not permits, but requires—enfolding and unfolding of self throughout as part of the study, so we can't do it for each other. Maybe in some endeavors such as carpentry or the poring over scriptures and Talmud by young rabbis, it is important to know first what tradition has accumulated, then build from there. (Dittes 2003, p. 14)

“But not psychology of religion,” Dittes writes, “which is a personalized process regarding a personalized process” (Dittes 2003, p. 14). From a career spent studying and working in both theological and psychological circles, Dittes came to realize that “[y]ou have to plant and tend new seeds every year” (Dittes 2003, p. 14).

And perhaps this is Dittes's greatest legacy for the fields of psychology of religion and pastoral theology: He has liberated us all to begin our work anew. But, as younger psychologists of religion and pastoral theologians strike out on their own journeys and begin anew, I think (and I think Dittes would also think) that there is still much to gain from listening to the experiences and insights of our mentors, and the mentors of our mentors, not for the sake of progress but for the sake of perspective.

Divination

Paul Larson

The Chicago School of Professional Psychology,
Chicago, IL, USA

Divination is the act of using contact between the supernatural world and the mundane world for the purpose of guiding human action. It is commonly thought of as an act of foretelling the future, or even dismissively termed “fortune-telling,” but this view is simplistic and ignores the social context of divination. In all situations where divination is practiced, there is a person, a “querent,” who has a need for guidance about what course of action to take with regard to a particular situation. The occasion of the divination generally comes at a specific time for a specific reason. When proffered as an amusement, as in a boardwalk fortune-teller, it may be done with little commitment to using the outcome. But the skill of the diviner lies in finding something that the querent can take away from the encounter that makes them feel value was given for the experience, and most importantly some guidance in making a decision about a course of action.

The nature of divination is a spiritual process of obtaining some contact between the two basic orders of reality, the spiritual realm and the mundane one. There is an implicit assumption of some sort of “realm beyond” that speaks in the moment and reveals information not otherwise available to the querent. Usually, the medium is the messenger. That is, the person of the oracle uses a state of trance possession to contact a spiritual power or entity and convey a message to the querent. The classic example of that is the pythia, the oracle of Apollo at Delphi who spoke as the voice of the deity while in a trance. The oracle can also read portents in random events, this is termed *sortilege* (e.g. clouds) or outcomes of other devices (e.g., tarot cards, and runes). A modern psychological explanation would typically involve some reference to unconscious processes accessing archetypal images relevant to the question posed by the querent.

The Jungian analyst Marie-Louise von Franz (1980) uses the principle of synchronicity to explain why events which seem random and occur in the same time frame have significance at a psychological level. In Jung’s thought synchronicity is distinct from causation, but important nonetheless.

It is simplistic to think that people view the pronouncements of the oracle as predicting the future in a mechanistic way. People vary in the degree to which they view events as beyond their control, but implicit in the social relationship between the diviner and the querent is the proffering of advice for a course of action in the face of the problem for which the divination is sought. There is nearly always a gap in time between the pronouncement and the ultimate outcome, time enough for the person to act upon the advice. If the feared outcome does not happen, the advice was helpful; if it comes about anyway, the person failed to heed the oracle’s warning. The critical feature is not whether the degree of certainty about the final outcome but to what extent counsel is taken and plans or actions initiated, changed, or aborted. Divination is action-oriented advice giving.

There are a variety of physical media of divination. Among the most popular in the west are the Tarot cards, the reading of lines on the palm, or the pattern of tea leaves in a cup. The Chinese oracle book the I Ching is also widely used. In previous eras animals were sacrificed for the occasion of the oracle, and the patterns in their entrails were interpreted. Among the oldest artifacts from Mesopotamia is a ceramic figure in the shape of a sheep’s liver with different areas marked out for their interpretive significance. There was probably an oral teaching or a cuneiform tablet now lost which catalogued the various meanings.

The interpretation of dreams is also a form of divination. The “incubation” of a dream by the god Asklepios was a major part of the ritual healing process in the ancient Greek world. The deity would come to the sufferer during a special sleep inside the inner sanctum of the temple, or *abaton*. The priests would interpret the dream the next day and prescribe the mode of healing to be

undertaken. Both Artemidorus and the Sophist Antiphon are reputed to have authored a book of dream interpretation, with the title *Oneirocritica*. When Freud wrote about the value of dream interpretation, he was reviving an ancient tradition, albeit with a different theory of hermeneutics or interpretation.

In a more contemporary vein, divination is the old term for the act of diagnosis. In all clinical contexts one of the most important functions of the therapist is to provide an explanation for the troubles the client brings to therapy. We may use modern psychometric instruments, further dialog or some combination of the above plus outside collateral information, but at some critical point early in the relationship, the professional presents the client with a summary view of the nature of their problems and the implications for course of treatment.

Divine Child

David A. Leeming
University of Connecticut, Storrs, CT, USA
Blanton-Peale Institute, New York, NY, USA

The myth of the divine child is ubiquitous in religious traditions. The child is a potential savior for a society in need. He or she represents radical change, the possibility of a new beginning. As such, he is a threat to the status quo, and the

representatives of the status quo – wicked kings and demonic monsters – therefore fight the child.

To represent the idea that the child is associated with divine intentions, his father is often divine. To emphasize that he is also of this world, he must be born of a human female. But the conception of the child is often miraculous – out of the ordinary – to signify his divine nature and to suggest that he belongs to the whole society rather than to any one family.

In ancient Egypt, the so-called Delta cycle of the Osiris myth contains the story of Isis conceiving a son, Horus, by her dead husband, the god-king, Osiris. Isis flees the usurper king, Seth, the brother and killer of Osiris, and gives birth to Horus in the hidden swamps of the Delta. One day, while Isis is away in search of food for her child, Seth comes in the form of a serpent and attacks the child. But the divine child stomps on the serpent, thus, surviving to continue his father's struggle against the forces of evil.

In a later tradition, Gautama, the future Buddha, is conceived by a white elephant in a dream experienced by his mother, Queen Maya. The Buddha's potential as a savior is challenged in his boyhood by his father, the king, who shelters the child to keep him from the harsh realities of life. And later, the youthful Buddha is unsuccessfully challenged by Mara, the fiend, who tempts him with the vanities of the world.

Moses, the Hebrew divine child and future savior, is threatened at birth with the other Hebrew children by the Egyptian Pharaoh and is hidden in bullrushes. He is saved and lives to lead his people out of Egypt to the Promised Land.

Jesus, the future savior, is miraculously conceived by God through the Holy Spirit which enters the Virgin Mary's womb. Soon after his birth in a hidden place, the child is threatened with other Jewish children by King Herod and has to be carried off into Egypt.

The Hindu man-god Krishna, the most important avatar of the god Vishnu, who contains the universe and the possibility of salvation within himself, is miraculously conceived through Vishnu, with the help of Maya ("Divine Illusion") in Devaki. But when the wicked king Kamsa learns that a child of Devaki will 1 day

kill him, he orders that any child of Devaki be killed at birth. To prevent this tragedy, Maya removes the embryo of the divine child from Devaki's womb and places it in the womb of Rohini.

These are only a few of the many stories of the divine child. Other examples can be found in the biographies of such figures as Heracles, Dionysus, Theseus, Zoroaster, Quetzalcoatl, and Cuchulainn.

The theological purpose of the divine child as future savior or embodiment of divinity on earth is clear enough. But the archetype resonates psychologically as well. For Carl Jung, the divine child – as opposed to the regressive puer aeternus – represents the urge within us all for individuation. This drive can be confronted from birth by what to it can be negative forces – parents, school, religion, the status quo, and its expectations. And the drive for individuation is confronted within the unconscious itself. The divine child in the womb is the preconscious hero – the self – waiting to be realized. Once born, he is the individual who enters the quest for individual wholeness.

Doubt

Ingeborg del Rosario

Emmaus Center, Quezon City, Philippines

The experience of doubt can be understood relative to faith and to belief. Doubt is commonly perceived to be inimical and opposed to, even erosive of one's faith, as an absence or significant lack of affective confidence and trust in God, in the divine-human relationship and in divine nature and power. The one who doubts is seen to be weak in faith. Relative to beliefs, doubt can be defined as an absence or significant lack of assurance and certitude, even an active dissent and questioning of religious doctrines and practices that traditionally provide structure and meaning to the faith experience. The one who doubts is seen as an unbeliever, unwilling or unable to acknowledge, assent to and embrace the truth of religious tenets and teachings.

Religious beliefs provide a way of articulating, conceptualizing, and providing meaning to the faith experience, that is, to the individual's experience of God and their relationship. Beliefs are about putting the faith experience into words. While beliefs support and facilitate a deepening engagement in the faith experience, they do not constitute it. The faith experience is not primarily about beliefs, but about a vital relationship: trusting and believing *in*, relying *upon*, entrusting *to* an other. Being relational, the faith experience is not static but ever unfolding and developing, in need of an evolving process of understanding, interpreting, and speaking about this experience. Unfortunately, many religious communities and churches resist the maturational development of beliefs. Dissent and doubt of beliefs are often equated to a lack of trust and confidence in God: one who questions beliefs is perceived to be without faith.

The book of Job in the Old Testament or the Hebrew Scriptures is a classic scriptural illustration of how a believer is often perceived to be lacking in faith because of the doubt and questioning of traditional religious beliefs.

Conventional Israelite wisdom upheld the doctrine of divine retribution: the one who does right prospers while the one who does evil is punished. A person who is afflicted must have sinned and so, suffers. The character of Job as a man who was upright and blameless, who did not sin yet suffered grievously, called this moral teaching into question. While Job's friends defended religious tradition as sacrosanct in their dialogues with him, Job vigorously resisted and challenged this inviolability. While the friends chided Job for his lack of trust and confidence in God's power and the divine will, Job confronted the paradoxical nature God. In Job's experience, God was both enemy and friend, oppressor and redeemer, and adversary and judge. Following the God's speech out of the whirlwind that addresses Job, the book ends with Job acknowledging that he has "uttered what (he) did not understand, things too wonderful for (him), which (he) did not know" (Job 42:3) and God upholding Job for he had spoken about God what is right (Job 42:8).

This story provides an apt paradigm for reflecting upon the experience of doubt in relation to faith and belief. Religious beliefs function to provide order and structure, purpose, and meaning to life and relationships. As did Job, individuals often begin to call into question these deeply ingrained and cherished normative beliefs following an experience of trauma, grievous loss, life-threatening illness, unrelenting crisis, or some wanton encounter with violence and evil. In the face of tragedy, the faith questions of believers often revolve around a need to understand and make sense of the event ("What did I do to deserve this?" "Why did this happen?"), the presence, will and agency of God in this event ("Where is God?" "How could God allow this to happen?"), and the consequent dissonance between one's God-image and the occurrence of this seemingly senseless reality ("How can a loving God allow this suffering?" "What kind of God would let this to happen?") Certitude collapses and doubt ensues when beliefs about God's nature and power cannot contain and support, provide order and structure, nor give sense and meaning to the believer in the midst of tragedy's ensuing chaos and disorder, instability, and disorientation. Uncertainty and

questioning of long-held beliefs might also occur in the face of less devastating personal experiences, with maturational challenges inherent in life-stage processes such as adolescence and mid-life, as well as in times of critical social developments.

The place and function of doubt in one's life, faith maturity and personal development is more easily appreciated with the understanding of how representations of God are formulated and internalized. Core metaphors and images of God are the foundation upon which religious beliefs are constructed. Religious traditions, creeds, and beliefs are built around God images and representations which originate primarily from parental sources or the impact of experiences with primary caregivers as well as from influences of social groups, peers, formal and informal religious education, and cultural conditions. The pioneering work of psychoanalyst Ana-Maria Rizzuto illustrates how representational traits attributed to God and the divine nature are shaped by childhood engagements, specifically by early parent-child relations and self-experiences. Images and metaphors of God as critical father, punishing judge, and distant deity or of God as loving and merciful, gentle and understanding, and compassionate and protective evolve for the child by way of transference as a function of projective identification, from idealized wishes and fantasies that stem from significant parental interactions as well as from the consequent introjection and self-mirroring images reflected by these experiences. With a growing self-image and individual maturation, increasingly expanding and intricate interpersonal and social engagements, challenges, and demands of life experiences, the deepening of self-awareness, and broadening of relational consciousness can come a corresponding evolution and refashioning of early God representations from childhood.

For many individuals, however, these God images formed from early on remain essentially static, rigid, and unchanged. Much psychic pain and emotional distress ensue when adult religious patients confront the complexities of crisis and tragedy with undeveloped childhood God representations and with religious beliefs and

practices that are built upon these unexplored and unrefined divine images and metaphors. Doubt and questioning of religious beliefs founded on archaic God representations that are a result of early unprocessed transferential parent-child experiences can thus be healthy and growth provoking, purifying, and transformative. Religious patients may be invited to inquire into how a particular belief or early God image had functioned for them and explore how it has promoted wellness or contributed to a lack of well-being. Similarly, the religious patient might look into fantasized consequences of doubting traditional beliefs or questioning deeply ingrained God images while the therapist might explore how inquiry and exploration, doubt, and questioning can also function to enable wellness as well as maturity in the life of faith.

The de-idealization of early God representations and working through of parental transferences onto the divine image in the therapeutic process, while difficult, painful, and grief filled, also enables a reflective challenging of religious conformity and compliance that are part of the false self and facilitates movement into greater spontaneity, freedom of self-expression, and creativity of exploratory play which constitute a release of and reconnection to the true self. As the sense of authentic self grows, expands, and deepens, so can the sense of God. The experience of God is released from restrictive and static constructs, freed from becoming a container of transference and projection material, and idealized wishes and desires. While creeds, traditions, and practices might remain unchanged, new and deeper levels of meanings may evolve. The adult believer becomes more open to the myriad possibilities of divine mystery and of encountering God as God, found in, yet always beyond, all form and image, concept, and representation. The adult believer is more able to hold and contain the awe-full prospect of a God who cannot be held and contained nor grasped with absolute knowledge and understanding.

As with Job, the mature believer is left with the terrifying yet liberating realization that, about God, one can only utter what cannot be understood and speak of things too wonderful that cannot be fully

known. Profound confidence and trust in the divine-human connection, life-giving faith, and right speech about God imply the continuing need for doubt of limited, limiting divine representations and questioning of static, archaic beliefs that cannot acknowledge the limitless breadth of the divine experience, the ensuing recognition of the vulnerability of words and language to articulate the creativity and mystery of divine-human relatedness, and the contemplative entry into reverent silence and reflective exploration of the God engagement which, like the true self, cannot be contained or confined by efforts to capture the radically free, ever-gratuitous process of unfolding and becoming towards a fullness of being.

Dragon Slaying

Ronald Madden
National Institute for the Psychotherapies,
New York, NY, USA

While dragons are imaginary beasts to be found in the mythology of cultures throughout the world,

the concept of *dragon slaying* is unique to the myths of the West. From St. Michael in the book of Revelation in the Christian New Testament, to Beowulf in the eighth century Anglo-Saxon epic poem of the same name, to Sigurd in Norse mythology (or Siegfried in Richard Wagner's retelling of the story), to Bard the Bowman in Tolkien's *The Hobbit*, dragon slayers engage in a heroic fight to the death with a large and powerful beast that threatens a community or the very balance of spiritual forces in the cosmos. These heroes become honored in the myths and legends of their culture and are symbolic of the victory of good over evil.

The word dragon comes from the Greek *δράκων* or *drakon*. Dragons appear throughout mythology as magical creatures with great physical and/or spiritual powers. Depending upon the culture, the dragon may be airborne – a great reptile with wings – or more worm- or serpentlike. In general, dragons of the East are powerful but benign creatures that are wise and revered by the people. In cultures of the West, dragons are often depicted as evil guardians of a treasure or horde which has been stolen from the people. The theft of this treasure has led to their decline, and the return thereof will reestablish their vitality and/or the spiritual balance of the cosmos.

It is perhaps not unsurprising, then, that the concept of dragon slaying is a singularly Western phenomenon and is to be found in that most enduring and powerful sacred scripture of Western culture: the Christian *Bible*. The following excerpt poses the dragon as the embodiment of Satan and St. Michael as the conquering hero in the name of Christ.

And there was war in heaven: Michael and his angels fought against the dragon; and the dragon fought and his angels, And prevailed not; neither was their place found any more in heaven. And the great dragon was cast out, that old serpent, called the Devil, and Satan, which deceiveth the whole world: he was cast out into the earth, and his angels were cast out with him. And I heard a loud voice saying in heaven, Now is come salvation, and strength, and the kingdom of our God, and the power of his Christ: for the accuser of our brethren is cast down, which accused them before our God day and night. (KJV, Revelation 12:7–10)

With St. Michael as a prototypical hero, numerous Christian saints from the early church have been depicted in legend as slayers of dragons (inter alia, St. Mercurialis, St. Margaret of Antioch, St. Clement of Metz, and St. Martha). St. George, probably the most heralded, killed a dragon who was terrorizing a city in ancient Libya. The people had been feeding sheep to the dragon to appease it, but when the sheep no longer satisfied the hunger of the dragon, they began to feed it their children. The victims were chosen by lottery and, one day, the daughter of the King was chosen. St. George happened by the lake where the dragon dwelled just as the daughter was being offered to the dragon and gravely wounded him with his lance. St. George and the princess led the dragon into the city and promised to slay him if the people were baptized into Christianity. Twenty thousand were promptly baptized and the dragon was slain (de Voragine 1993, pp. 238–240).

In the eighth century Anglo-Saxon epic poem of the same name, Beowulf traveled to help an aging king rid his kingdom of a terrorizing troll named Grendel and his avenging mother. Beowulf then returned to his people and reigned as king for 50 years until a dragon threatened to destroy his kingdom. The dragon guarded a rich treasure that was kept in a burial mound, but was angered when a single drinking cup was stolen from the hoard. Beowulf and a young chieftan attacked and killed the dragon as it sought to lay waste to the kingdom. Beowulf was mortally wounded in the fight, but, before dying, he bequeathed the dragon's hoard to his protégé, Wiglaf (Willis 2006, p. 205).

A prime example of the restoration of a treasure that had been stolen and guarded by a dragon can be seen in Richard Wagner's nineteenth century retelling of the ancient Norse legend of the hero Siegfried (Sigurd) and the dragon Fafner (Fafnir). The story is of a magical ring, forged of twice-stolen gold, all of which ends up as a hoard in the lair of the dragon and is eventually returned to its keepers, from whom it was originally stolen, after dragon is slain by Siegfried. This retrieval of the ring and the gold and its return to the rightful owners – the central plotline of Wagner's grand operatic tetralogy, *Der Ring des Nibelungen* – takes the audience on a journey which restores

the disrupted spiritual balance of the cosmos while at the same time destroying those who have stolen these precious and magical items, only to use them in a quest for their own greed and power.

In J. R. R. Tolkien's *The Hobbit*, the main antagonist is the dragon Smaug who destroyed the town of Dale and captured the mountain Erebor with all its treasure. Smaug's belly was encrusted with the hoard's "gems and fragments of gold from his long lying on his costly bed" (Tolkien 1984, p. 199), rendering him practically invulnerable to attack. When Bilbo Baggins, the main protagonist of *The Hobbit*, encounters Smaug sleeping in his lair, Tolkien (with a nod to *Beowulf*) causes him to steal a "great two-handed cup" from the hoard. One place on his left breast was left unprotected, allowing Bard the Bowman to slay Smaug with a black arrow when he came to destroy the lake-town of Esgaroth. The hero, Bard, was elevated to the first king of Dale, restored after its destruction by the dragon, Smaug.

In Western mythology dragon slaying represents the act of the questing and conquering hero to destroy an evil creature that guards a hoard or threatens people with its powers. Dragon slaying refers, then, to the act of killing this creature or subduing its power, so that life may go on. In a psychological sense, dragon slaying can be thought of as the subduing or integration of powerful internal forces of opposition which can tend to overwhelm the ego and destroy psychological and spiritual equilibrium; the repair of which is necessary to achieve individuation or wholeness.

In the realm of psychology, the dragon in need of "slaying" may be a constellation of unconscious, shadowy energies that have been rejected by the ego. Even though cast off, these energies may control the conscious life or may be projected outwardly onto others who then hold both our rejected parts and our rejection of them. This inner dragon "guards," or keeps from us, a treasure of wholeness which can only be realized by neutralizing its power. As C. G. Jung writes, "[t]he treasure which the hero fetches from the dark cavern is *life*: it is himself, new-born from the

dark maternal cave of the unconscious. . ." (Jung 1990, p. 374).

Slaying of this dragon constitutes making the unconscious parts of the ego conscious. Jung continues, "[t]he hero who clings to the mother is the dragon, and when he is reborn from the mother he becomes the conqueror of the dragon. . . [he] represents the positive, favorable action of the unconscious, while the dragon is its negative and unfavorable action-not birth, but a devouring; not a beneficial and constructive deed, but greedy retention and destruction" (Jung 1990, pp. 374-375).

The process of individuation, or achieving psychological wholeness, is not unlike the hero's journey. As Joseph Campbell describes in *The Hero with a Thousand Faces*:

the mythological adventure of the hero is a magnification of the formula represented in the rites of passage: *separation-initiation-return*: which might be named the nuclear unit of the monomyth. Prometheus ascended to the heavens, stole fire from the gods, and descended. Jason sailed through the Clashing Rocks into a sea of marvels, circumvented the dragon that guarded the Golden Fleece, and returned with the fleece and the power to wrest his rightful throne from a usurper. (Campbell 2008, p. 23)

This formula is observed in myths and legends of the ancient past. It is seen in more contemporary retellings of hero journeys, such as *The Hobbit*, in which Bilbo Baggins descends into the dragon Smaug's lair and retrieves a treasured drinking cup. J. R. R. Tolkien subtitled his contemporary myth, *There and Back Again* (Tolkien 1984). Dr. Franz Winkler writes, each of us "has a dragon in his subconscious mind, which he must overcome lest he fall victim to the forces of darkness within" (Winkler 1974, p. 44). The inner voyage taken in depth psychology or spiritual direction, a descent away from a "false, exterior self," leading to the discovery of a "true, interior self," can be a treacherous night sea journey or *nekiya* wherein one or more dragons are confronted and conquered before coming "back again." As Jean Shinoda Bolen states:

The dragon fight can be with an addiction, regression, depression, or aggression, or any

destructive complex in the psyche that keeps a person from growing. The dragon fight can also be enacted with real people who are in intimidating, devouring, or abusive...Some inner dragons must be fought because we are already in their grip, some stand in our way and prevent us from growing, and others lash out through us at others. Even when the dragon seems to be a real person or a chemical addiction, it is the susceptibility to be overcome by this kind of person or substance that makes it dangerous. (Bolen 1999, p. 115)

Dreams

Louis Hagood

Oxbridge Communications Inc and MediaFinder.com, New York, NY, USA

Up until the time of Aristotle, dreams were divine – messengers from the gods or spirit world with the power of prophecy or healing. Priests or shamans were the intermediaries for these messengers, and in ancient Greece a network of temples, dedicated to the half God Aesculapius were popular sites for dream healing. Aristotle declared that dreams were not from the gods and were not prophetic but leftover sensory impressions from waking life.

At the beginning of the twentieth century, dreams were not only mortal but crazy as well. Freud published his *Interpretation of Dreams* in 1900 not only to distance dreams from the divine but also to rescue them from insanity. Dreams had meaning, and he demonstrated how the meaning was disguised. Freud was a product of classical science with its reductionism and determinism, and his dream work follows that tradition, one that, had no place for the mystical or the divine. His was a one-person model with forces both outside and inside creating dreams. As the twentieth century progressed, classical science was challenged by new physics and its theories of relativity and quantum mechanics, which challenged the old.

Jung analyzed the dreams of the physicist Wolfgang Pauli and found the new physics more compatible with his mystical inclinations. His theory that dreams were a compensation for an unbalanced conscious position coming from the collective unconscious was like the quantum concept of a particle emerging from the sea of infinite potential. The collective made Freud's one-person dream model into a group phenomenon.

The group phenomenon has been utilized by Montague Ullman in dream sharing. In a group the dream is not interpreted as in Freudian or Jungian therapy, but responded to as if it were

the dream of each respondent. Thus the dream is truly no longer a one-person experience but communal.

Dreams and Religion

Lee W. Bailey
Department of Philosophy and Religion, Ithaca
College, Ithaca, NY, USA

Does divinity appears in dreams? To answer this we must broaden our conceptions of “divinity,” and the scope of the term “dream.”

At the age of 31, I was wrestling with my soul’s desire to fly, to reach for a higher realm and find my authentic self, symbolized by flying. This urge appeared in several dreams, along with images of the opposite: fear of falling/failing. In one dream:

Finally I went to the center of my being, through a pool into two underground levels to a bird, still walking in its placenta, having not left this place. Then I saw the top pool drain, leaving a central hole and the problem of self-discovery. Very rich, warm, friendly dream.

At the center of my being, under the surface, was a bird, still in its placenta, but walking, ready to be born. I knew that was in the center of my personal being, a piece of what Plato and others

call “being” itself or ultimate reality: “*true being dwells, without color or shape . . . the soul’s pilot*” (Plato, *Phaedrus*, 247c). This is the mysterious depth of existence itself, the vast power behind the anthropomorphic God the Father, and Son, or Goddess the Mother and daughter. We need these personified images to feel this overwhelming power, but they are just earthly fragments that we make into “religions” while dimly sensing that being is all much more extensive. And Being is the soul’s pilot.

Psychologically, Carl Jung called dream images such as my bird in a placenta the Self, the image of divinity within. This image can take any form; he saw a sphere sparkling with lighting, a peaceful pool glowing with aqua light, and a circle mandala. Such a Self image is mysterious because earthly birds hatch in shells, not placentas. But both are wonders of earthly birth from a greater power. The placenta bird presents my archetypal drive to fly higher, like an eagle, and float amid the presence of Being to access my self-discovery. It needed only to be born, to fly, to take in a dream to my consciousness new guidance and courage for self-discovery – the power of the dream to bring my soul the psycho-spiritual energy it needs. It transformed me, and I am thankful for it.

The appearance of such broadly “religious” images and themes in dreams is ancient and widespread. But alien to ego, they are often surprising, requiring thoughtful interpretation of symbols. Indigenous peoples commonly saw dreams, especially “Big Dreams,” as communications from the Spirit world that surrounds them. A dead relative or ancestor could easily appear in a dream now seen scratched in code on a rock from the Australian Aborigine “Dreamtime” (Mudrooroo 1994). Dreams rarely portray divinity as a traditional image of an old man in the clouds. Rather, images such as animals, light, stars, and feelings such as hope, angels, cosmic wonder, and spiritual peace are more common, even when conscious events seem hopeless. Dreams, sparkling and flying with surprises, baffle ordinary consciousness, sometimes bizarre or frightening, often psychologically transformative, occasionally magnificent.

Interpretation

Critics will ask: but are dreams even meaningful? Dreams are studied in many ways, from the highly conscious neurological idea of meaningless “random neuron firings” to emotionally moving and transformative symbolic personal, collective, and religious meanings in depth psychology. Today, the influence of highly rational ego consciousness as the path of verifying “truth” produces meaningless or superficial “subjective” results about dreams. Ironically, Descartes, who firmed up the subject/object dichotomy, rejected the meaningfulness of dreams, even though his inspiration came from a dream. This expresses the rationalist attempt to deny the deep sources of dreamy feelings that lie under their own consciousness, as in the utopian fantasies behind technologies (Bailey 2005).

Sigmund Freud, although rooted in nineteenth-century materialism, opened the way for modern dream interpretation. He showed the meaningfulness of dreams and their healing power. He cracked open the dominant surface rationalism, descended into unconscious psyche, and focused on the Oedipal myth as his central theme – a son/daughter competes with father/mother for their love and feels guilty about incestual fantasies. He saw many dreams as wish fulfillments. Freud rejected religion as an infantile illusion rooted in a father complex. He helped deconstruct the Victorian era’s repression of sexuality, which of course triggered outraged reactions but eventually led to twentieth-century sexual liberation. Psychic transformation with openness to deep, meaningful imagery often accompanies sexual openness.

Carl Jung welcomed Freud’s opening up unconscious dynamics but rejected his narrow focus on sexuality. He saw sexuality as just one of a vast number of archetypal complexes in dreams – shadows, lovers, prophets, and divinity. His astonishing *Red Book* shows the power of the unconscious psyche behind thinking. It also shows the numerous images that can convey sacredness. This book was the unconscious root of his influential archetypal psychology. Although as a psychologist he said he was not doing theology when discussing God images, in

his early private *Red Book* he said: “I daily weigh up my whole life and continue to regard the fiery brilliance of the God as a higher and fuller life than the ashes of rationality” (Jung 2009, p. 339). Later the leading archetypal psychologist James Hillman pressed Jung’s thought further, pointing to the importance of polytheism and the need to expand psychology to include the environment.

Dream Scope

In the 1860s the German chemist Friedrich Kekulé had a daydream of a snake holding its own tail in a circle (*Ouroboros*) that gave him the insight for his successful model of the important benzene ring (von Stradonitz). This not only shows how dreams can affect the material world but it raises the question of the scope of dreams: must only night dreams be considered? How are dreams related to waking life? The answers are many. The ancient Greeks spoke of “night visions” and “waking visions.” Jung used “active imagination.” Many today reject the idea that the unconscious appears only during sleep, thus theoretically leaving waking consciousness as a purely rational state. Rather, imaginative, dreamy visions occur on a broad spectrum with a fuzzy border, including consciousness, appearing as easily accessible feelings such as enchantment, trance, empathy, and intuition. Near-death experiences are well-researched intermediate states that also disclose religious themes (Bailey and Yates 1996). Dreamy visions can occur in altered states, waking visions, or twilight consciousness, as Kekulé’s daydream shows.

Dreams and Reality

Mysterious and actually healing light suggests divine influence in dream visions. A woman told me that in her twenties in Central America,

she was dying – hemorrhaging dangerously one night, shivering cold, when a numinous shaft of light from above, which only she could see, thrust down into her body and filled it with light. She immediately recovered.

Dream visions can heal. Such encounters with the soul and being can bring out intuitive perceptions of various degrees of reality – hidden psychological patterns such as self-discovery, widespread archetypal themes such as flying, intuitive glimpses of life patterns, and physical changes, such as healing. These breakthroughs often happen in times of a crisis that overthrows rational self-control.

Native Americans

The Native American Vision Quest is one of many dreamlike experiences among Indigenous peoples worldwide. Sometimes it is sought ritually, sometimes it comes unasked. Black Elk (1863–1950) was a Lakota Sioux whose people lived around the Black Hills. As a 15-year-old boy he fell sick.

He was carried up to the clouds, where thunder beings flashed. Then the boy saw horses with lightning manes and thunder in their nostrils, dancing all around. He was led to a teepee with a “rainbow entrance,” where he saw six Grandfathers, who looked older than men can be – “old like hills, like stars.” He shook with fear, since he realized that they were not old men, but “The Powers of the World.” These awesome Grandfathers each taught him Powers that he would need as a shaman or holy man (wichasha wakon). They gave him the Power of the Thunder Beings, who would take him high to the Center of the World so he could “See.” They gave him the power to make live, to grow, and to understand his relatives in nature and the stars. He saw himself grow into a Grandfather. After he returned to this world, each morning he rose before dawn so he could commune with the Morning Star.

He transformed his vision into a ritual to teach his people the Sacred Way that he had seen and healed many (Neihardt, Ch. 3).

Judaism

In the Jewish *Torah*, Jacob had a dream important to Hebrew theology. After leaving home he put a stone under his head to sleep:

And he dreamed that there was a ladder set up on the earth, and the top of it reached to heaven; and behold, the angels of God were ascending on it!

And behold, the Lord stood above it and said “I am the Lord, the God of Abraham your father and the God of Isaac; the land on which you lie I will give to you and to your descendants . . . And [Jacob] was afraid and said,” How awesome is this place! . . . this is the gate of heaven” (Genesis 28:11–17).

The Hebrew God (*Yahweh*) often spoke to humans in dreams and visions like this, such as Moses’ vision of the Burning Bush (Exodus 3:2).

Greece

The ancient Greek word for a revelation received in a dream was *oneiraiteton*. In Homer’s *Odyssey*, grieving Penelope, worried about Odysseus and their son Telemachus, was sent a dream by the goddess Athena:

The dream figure went into the bedchamber. . . and came and stood above her head and spoke a word to her: ‘Penelope, are you sleeping so sorrowful in the inward heart? But the gods who live at their ease do not suffer you to weep and to be troubled, since your son will have his homecoming even yet, since he has done no wrong in the gods’ sight’ (Homer, IV, pp. 801–807).

In her *Dreams in Late Antiquity*, Patricia Cox Miller analyzes several important issues and cases, such as in Plato, who said:

No man achieves true and inspired divination when in his rational mind, but only when the power of his intelligence is fettered in sleep or when it is distraught by disease or by reason of some divine inspiration (Plato, *Timaeus*, 71E).

Christianity

Among early Christians, Tertullian observed that *most people get their knowledge of God from dreams* (Tertullian 1947, 47.2, p. 65). During Tertullian’s life the Roman woman Vibia Perpetua in March 203 CE in Carthage was a 22-year-old Christian martyr, married, nursing an infant, and imprisoned for refusal to renounce her strong faith and burn incense to Roman gods.

In a dream she saw a bronze ladder reaching to heaven. On its sides were fixed weapons of

destruction. She stepped on a serpent/dragon/Devil's head. As she climbed she saw a garden below with a white-haired man milking, who said "You are welcome, child." He gave her some delicious cheese (Miller, 152). This seemed to prepare her for her coming suffering, affirm of her courage, and promise that God will feed her soul.

When Perpetua was actually sent into the arena, she sang Psalms ecstatically. Then she was knocked over by an angry cow, then stabbed with a sword (Von Franz 1980, p. 14).

In her *The Passion of Perpetua*, Jungian analyst Marie-Louise von Franz noted the parallel between Perpetua's bronze ladder and Jacob's ladder to heaven and its symbolism of attaining a higher consciousness (Von Franz 1980, p. 16). She saw the old shepherd as the divine Self and milk as spiritual teaching (Von Franz 1980, pp. 30–33). Like Christ, Perpetua had the courage and faith to endure suffering and death with the promise of eternal life.

Islam

Muhammed was an unlettered man who went to a cave for meditation on Mount Hira, Arabia (610 CE). One night he was aware of the majestic presence of the angel Gabriel, saying "*Iqra!*" ("Recite!"). Muhammed was petrified, but the numinous power before him was compelling. He woke up and remembered the message written in his heart. He saw Gabriel spanning the horizon, saying: "*You are the apostle of God.*" For 22 years Muhammed continued to receive such revelations, as lights, auditory voices, or a ringing bell. He lifted up Allah, and his revelations became the sacred *Qur'an* (Bulkeley 2008, pp. 193–194).

India

Kelly Bulkeley, in his *Dreaming in the World's Religions*, concludes that "*Dreaming has always been regarded as a religious phenomenon*" (3) and that it is a primordial source of religious experience (6). In India, although some dreams

are seen as demonic or illusory, religious dreams are common.

Once a man went to a Vishnu temple and dreamed that he would have a son who would be the avatar of Vishnu himself. The man's son became Sri Ramakrishna, a highly revered mystic with a large following (Bulkeley 2008, p. 41).

China

Royal Chinese courts such as the Zhou dynasty (from c. 1100 BCE) relied on dream interpretation for political decisions by experts called *Tai Pu* and (usually women) *wu* (Bulkeley 2008, pp. 54–55). Kings were expected to follow the interpretation of dreams as the will of the Mandate of Heaven and the ancestors (Bulkeley 2008, p. 56). Confucius' dreams emphasized themes such as how the harmony of the state followed from the virtue of the ruler (Bulkeley 2008, pp. 61–62). The more mystical, paradoxical Daoists stressed individual self-awareness and the mysterious interplay of waking and sleeping consciousness:

Long ago, a certain Zhuang Zi dreamed he was a butterfly ... happy and carefree.... Then all of a sudden he woke up to find that he was, beyond all doubt, Zhuang Zi. Who knows if it was Zhuang Zi dreaming a butterfly, or a butterfly dreaming Zhuang Zi? (Bulkeley 2008, p. 64).

This text raises the fascinating ontological question of dreaming: what is reality?

The conscious, logical ego deals with the physical world. But ego had no adequate reason to deny that a broader reality is revealed in dreams, symbolic as they may be.

Buddhism

The Buddha saw dreams as potentially beneficial to Enlightenment, but no more than the highly refined mental state of meditation. One Chinese Buddhist painter, Kwan Hiu, combined meditation, visualization, and dreaming to create his art, saying "*I paint what I see in my dreams*" (Bulkeley 2008, pp. 93–94). Early Buddhist traditions saw dreams as authentic ways of

communicating with the divine. A Japanese Buddhist Lady Sarashina had a “Big” dream.

Through the mist in a garden she saw the Amita Buddha. He glowed with golden light and was invisible to all but her. She was impressed but frightened. He said, “I shall leave now, but later I shall return to fetch you.” That dream gave her hope for salvation (Bulkeley 2008, pp. 95–96).

The *Tibetan Book of the Dead* is a powerful Buddhist text to be read to the dying in their dreamy, visionary in-between state (*Bardo*) of consciousness and to meditatively prepare any reader for death in the colorful Tantric Tibetan tradition. It absorbs the pre-Buddhist Indigenous Bon religion, full of demons and deities, and reframes it into a Buddhist world. Here the first thing a dying person can expect to see in their visionary state is the blazing luminosity or *Dharmakaya*, the essence, the isness of existence, and the body of truth or law. If, thanks to their education and meditative awakening to the Buddha mind, the dying one recognizes this as the Buddhist ultimate reality, he or she is freed from reincarnation to merge with the Light of Nirvana. If one fails to recognize this truth, he/she moves on to a series of dramatic psychic images or projections of colorful demons and deities. Here the opportunity to recognize the *Dharmakaya* and be liberated is repeatedly available. But if there is no recognition, one passes on to the next stage. First one sees the Bardo of the reassuring Peaceful Deities, then the Bardo of the horrifying Wrathful Deities, then the resigned Bardo of Becoming, or reincarnation, from higher to lower earthly beings, depending upon one’s life and awakeness (Fremantle and Trungpa 1975).

Dreams and dreamlike states or visions glowing with divine power are common experiences with powerful images that can heal the body and soul, prepare for death, and provide guidance and meaning. They can be life changing and culture changing. Today interpretive methods are still being explored by scholars such as Wendy O’Flaherty and Morton Kelsey and psychotherapists, notably Jungians. Kelly Bulkeley is engaging in dialogues with contemporary neuroscientists to find common ground for understanding dreams (Bulkeley 2005).

Dreams in Jungian Therapy

Barbara Platek

Graduate of Pacifica Graduate Institute, Ithaca, NY, USA

In each of us there is another whom we do not know. [S]He speaks to us in dreams and tells us how differently [s]he sees us from the way we see ourselves. When, therefore, we find ourselves in a difficult situation to which there is no solution, [s]he can sometimes kindle a light that radically alters our attitude. C.G. Jung (1979: Collected Works 10, para. 325).

Dreams and dreams interpretation are central to the practice of Jungian psychotherapy. At one point Jung stated that the analysis of dreams was a therapist's "professional duty" (Jung 1979: Collected Works 18, para. 476). As long as there were "no counter indications" (that is, as long as a dreamer's ego was deemed strong enough to interact with unconscious material), he considered dream analysis the most direct and effective way for the individual seeking therapy to discover and assimilate unconscious contents (Jung 1979: Collected Works 16, para 295). Jung believed that psychological problems arose when the conscious mind strayed too far from its instinctual roots in the unconscious. Dream work allows access to repressed energies and hitherto unlive potentials within the unconscious, thus enriching the conscious mind and allowing for greater self

knowledge and a new orientation towards life. "The dreams fetch up the essential points, bit by bit, and with the nicest choice" (Jung 1979: Collected Works7, para. 218).

Interacting with dreams allows the dreamer to glimpse the centrality of the Self – the image of wholeness or Divinity in the psyche – as the guiding force in our life. Exploring dreams in a therapeutic or healing context allows the dreamer to see where his or her life energy is blocked and where it wants to go. While dreams can always be viewed from different perspectives and understood in various ways, they help move the dreamer toward a more conscious life and assist him or her in tapping into the source of creativity – the water of life within.

As the Jungian analyst Marie Louise von Franz noted:

(Dreams) have a superior intelligence in them: a wisdom and guiding cleverness which leads us. They show us where we are wrong; they show us where we are unadapted; they warn us about danger; they predict some future events; they hint at the deeper meaning of our life, and they convey to us illuminating insights. . .there is a superior intelligence which we could call an inner guide or divine center which produces the dreams, and. . .the aim of dreams seems to be an optimum life for the individual (Boa 1988).

Dream Work

"The art of interpreting dreams cannot be learned from books. Methods and rules are good only when we can get along without them" (Jung 1979: Collected Works10, para. 325). Working with dreams is both an art and a skill. The therapist must be sensitive to the atmosphere of the dream as well as to the dreamer's emotional state. At its best, dream work is a collaborative conversation between therapist and dreamer. Together they explore and "circumambulate" the dream, gathering impressions, associations, repetitions, and themes. The therapist brings her training and expertise to bear in the recognition of dream structure, mythological and archetypal motifs, and the symbolic language of dreams.

Always it is important that the therapist holds the dream with reverence and a sense of mystery. The therapist needs to be cautious about easy or theoretical understanding. The analyst Edward Whitmont reported a personal conversation with Jung in which he said: "Never, never assume that you know what a dream means!" (Whitmont 1990). For an interpretation to feel correct and satisfying, it must win the embodied assent of the dreamer, he or she should feel a kind of "aha" moment, a kinesthetic "yes" that carries a sense of surety and authenticity.

Dream analysis can strengthen the therapeutic alliance and create a sense of safety and trust. An atmosphere of curiosity and play can allow a client to comfortably explore material previously not brought into the therapy space. For example, a woman struggling with a difficult past brought a dream in which she saw "dead bodies strewn through her backyard." From this striking image she was able to recognize that she had not "buried her dead" in a psychological or emotional sense and that unresolved issues and experiences threatened to rot and pollute her current life. As she contemplated the dream with her therapist, she was able to allow herself the time and space to tend some difficult material from her past and begin the process of finally putting it to rest.

In exploring dreams, the dreamer can be encouraged to role play with dream material, to provide "alternative" endings or actions for dreams, to engage in a creative way with dream material through art or movement, and to otherwise expand his or her range of responses to dream imagery and situations. A dreamer who reported a dream in which she was a passenger in someone's car, for instance, was asked to imagine what it might feel like to get behind the wheel of her own vehicle. Through this imaginative interaction, she began to sense something of what it was like to step into the "driver's seat" in her own life and to contrast that with the experience of being driven around by someone else.

In the end it is not enough to merely understand a dream. Real change occurs when material is assimilated into the conscious personality, for example, in the case of the woman who began to confront her "dead." Beyond insight, the feelings

and imagery of dreams need to be grounded within the psyche and life of the dreamer so that true healing may occur. Working with dreams brings about a kind of moral or ethical obligation. Ultimately, this is a responsibility to ourselves, to become the whole person we are capable of becoming and to move the hints and urgings of the dream from potentiality to real life awareness and practice.

The Program of the Unconscious

Many Jungian psychotherapists pay particular attention to what is known as the initial dream. There is no set criterion for what constitutes an initial dream – it may be the first dream remembered after the first therapy session, it may be the dream that occurred just prior to the first session, or even the first significant dream following several sessions. While the manner of selection for the initial dream will depend a great deal on the therapist's intuition and judgment, this dream can carry a great deal of importance for the course of the therapy. The initial dream may reveal the nature of the work to be done by therapist and dreamer, it can shine a light on the core issues facing the dreamer and also offer hints and suggestions for the progress of the therapy. It is possible for such a dream to "reveal to the doctor...the whole programme of the unconscious" (Jung 1979: *Collected Works* 16, para.343).

Just before entering therapy, for example, a very private and reserved woman had a dream in which she saw a "permission slip" coming through a fax machine. For this woman, "permission" to reveal her inner life was a profound shift in her habitual mode of relating to the world. Both she and the therapist heard the dream as an indication of support on the part of the unconscious for the therapeutic process. The dream served as a touchstone for the therapy, continually reminding the client that it was alright for her to share her feelings and experiences with those around her. She had indeed been given "permission" to participate in the process of therapy as well as in her own life.

An initial dream cited by the Jungian analysts Edward Whitmont and Sylvia Perera presents a different picture: “I live in a house that is a ghost ridden, decrepit shack built on rotting stilts over a swamp. The muddy road leading to it is booby trapped with land mines” (Whitmont and Perera 1989). Here the dream presents an image of an unstable and potentially dangerous situation within the psyche of this male dreamer. The place in which he lives – the “shack” – is shown to be decrepit and ready to fall to pieces. That is to say, the psychological space in which he resides is not solid and could easily topple (suggesting a possible threat of breakdown or psychosis). Furthermore, any attempt to work with this dreamer – to reach him or to form a therapeutic alliance – is “mined”. Thus the dream presents a stark warning to the therapist about the dreamer as well as the implications for the therapeutic process. Whitmont and Perera report that the therapist did, indeed, heed the dreams warning and referred the case to a more seasoned clinician.

The Situation As It Is

For Jung, the dream revealed “the inner truth and reality of the patient as it really is: not as I conjecture it to be, and not as he would like it to be, but as it is” (Jung 1979: Collected Works16, para.304). Every dream can be seen as a message from a superior intelligence that Jung called the Self. This guiding principle nightly sends hints and clues as to how the personality might become more well rounded, balanced, and whole. Thus dreams can reveal the energy patterns that limit or sabotage our growth and existence, they can remind us of forgotten talents and interests that might enrich our sense of self, offer support for new directions, and challenge our lop-sided or overly rigid ways of moving through life.

A male dreamer who thought of himself as a peaceful, spiritual person had a dream in which he violently destroyed his wife’s garden. The image of such destructive rage was abhorrent to this dreamer. Nonetheless, the dream paved the way for many fruitful conversations about anger and the ways that it was dealt with in the dreamer’s

family of origin as well as his present day relationships. The dream revealed to both the therapist and dreamer that this man had a great deal of hidden rage that needed care and attention if it was not to become destructive to himself and others.

Receiving insight from dreams requires a willingness on the part of the dreamer to see themselves in new ways. Dreams are difficult to understand, not only because they speak in symbolic language but because they frequently present an image of the dreamer and her behavior, attitudes, blind spots, and fears of which she is not aware. Thus work on dreams requires an attitude of humility and an openness to new, sometimes unsettling, information, and perspectives.

Dreams rarely confirm the viewpoint held by the dreamer. Like an x-ray, they reveal a picture of the dreamer’s current situation as seen from the perspective of a wider consciousness. According to Jung, the dream “rectifies the situation. It contributes the material which was lacking and which properly belongs to it and thereby improves the attitude. This is the reason why we need dream analysis for our therapy” (Jung 1979: Collected Works8, para. 482).

In some cases the “material which was lacking” may be an acceptance of a talent or strength or encouragement to move forward in a certain direction. The Jungian analyst Renee Nell reports the following dream of a woman who was struggling to accept a natural talent for writing:

I was in a dark forest and I was led forward as if by magic. I followed a supernatural, beautiful, silvery light that was shimmering through the thicket. As I finally came to the illuminated place, I found a large silver penholder tied to a tree. It emitted a supernatural beautiful light. My initials showed clear on the penholder (Nell 2005).

According to Nell, the dreamer awoke startled that such a beautiful gift should belong to her. This powerful dream worked to encourage and support the dreamer in her creative life and reassured her that she did, in fact, have real talent and ability. Such supportive dreams can balance the dreamer’s fears and insecurities and instill a sense of confidence and faith in a particular life direction or choice.

Archetypal Dimensions

Sometimes dreams can present imagery and situations that seem to draw upon motifs from the mythological storehouse of humankind. These archetypal images arise from a layer in the psyche that is beyond personal consciousness and conveys a transpersonal, numinous quality. Often their appearance in dreams carries a peculiar, slightly otherworldly tone, which creates a sense of awe in both dreamer and therapist. Such dreams seem to come from a different level of the unconscious and, as Jung said, can “stand out for years as spiritual landmarks” (Jung 1979: Collected Works 17, para. 208).

The mythological or archetypal aspects in dreams arise from the ancient storehouse of human experience that underlies patterns of religious rites and ceremony dating back to the beginning of time. They encompass such experiences as birth, death, childhood, sacrifice, conflict, and relationship. They may feature archetypal figures like the wise old man, the child, the mother, the witch, the trickster, or thief. Many of these images have parallels in mythology, fairy tales, philosophy, and religion and reflect the primordial, structuring elements in the human psyche.

For the therapist it is helpful to listen to dreams with an appreciation for the story-telling or myth-making aspect of the psyche. Deep healing can occur when a dreamer can hear their own personal narrative as somehow interwoven with the larger themes of life. Archetypal patterns offer the dreamer meaning and guidance in relation to their own destiny and experience.

We can recognize the presence of magical-mythological motifs when a dream presents element which seem rationally impossible according to everyday reality. Here is a recent dream of my own:

I am walking and see a beautiful, perfectly formed bird's nest up in a tree. I look back and see an owl sitting in the nest. I am amazed that I get to see the owl but start to move away in case I disturb its nesting process. I hear a “whooshing” sound above my head. I look again and, this time, I have a direct view into the nest. I see a baby boy with a wise, mature face. I lift him out of the nest and carry him home.

This is no ordinary child that has been born in an owl's nest. Instead the child's wisdom and maturity suggest the archetype of the Divine Child. The Divine Child is a universal manifestation of the child archetype. It can be found throughout time and place in the mythology and artwork of virtually all peoples of this earth. Some examples familiar from Judeo-Christian culture include the Christ child and Moses. The child motif is almost always associated with something miraculous or divine – the wonder child whose origins are unique (virgin birth/abandonment) and whose life is somehow associated with redemption and wholeness. In his essay on the child archetype, Jung writes:

It is a symbol which unites the opposites; a mediator, bringer of healing; that is one who makes whole. . . . It represents the strongest, the most ineluctable urge in every human being, namely the urge to realize itself. It is, as it were, an incarnation of the inability to do otherwise (Jung 1979: Collected Works 9, paras. 278, 289).

Amplifying the image of the child in the owl's nest brings a sense of depth and numinosity to the dream and places it within a mythological context. It is helpful for therapist and dreamer to explore an image through its mythological parallels and allow the archetype to resonate through the vast repository of folklore, religious and artistic themes. They can then ponder the significance of such an image for the dreamer and his or her life journey.

In my case, I might wonder what new birth is taking place and ponder the sense of wholeness and divinity attempting to incarnate in my psyche and life. The child, says Jung, is a special case of the motif of the “treasure hard to attain” – or an image of the Divine spark or Self – such as the precious stone, the pearl, the flower, the golden egg, the golden sphere, the quaternity, etc.” (Jung 1979: Collected Works 9, para. 270). Thus I might reflect upon my own relationship with the Divine and the ways in which the “treasure hard to attain” is being safeguarded and honored in my own life.

While archetypal dreams inform us of our soul heritage, allowing us to sense something of the largeness of we are, they can also seduce us away from the reality of the here and now and the presence of genuine psychological issues in need

of attention. As Jung said archetypal concerns are legitimate only when they “arise from the deepest and truest needs of the individual; illegitimate when they are either mere intellectual curiosity or a flight from unpleasant reality. . . people who go illegitimately mooning after the infinite often have absurdly banal dreams which endeavor to tamp down their ebullience” (Jung 1979: Collected Works 7, para 288). Thus it is important for the therapist to regard archetypal dream elements with care and sensitivity. True healing encompasses the entirety of the person, moving beyond intellectual ideas into the realm of authentic experience.

A Little Hidden Door

“The dream is a little hidden door in the innermost and most secret recesses of the soul, opening into that cosmic night which was the psyche long before there was any ego-consciousness, and which will remain psyche no matter how far our ego-consciousness extends” (Jung 1979: Collected Works 10, para. 304). Working with dreams is a profound and effective way to connect to the deepest wisdom of the Self. Jung once said that we “live as though we were walking in shoes too small” (Jung 1979: Collected Works 8, para. 739). Dreams allow glimpses of the person we are meant to become.

As the Jungian analyst Marie Louise von Franz phrased it:

The dreams cannot protect us from the vicissitudes and illnesses and sad events of human existence. But they do give us a guiding line on how to cope with them, how to find a meaning in our life, how to fulfill our own destiny, how to follow our own star, so to speak, in order to realize the greater potential of life within us (Boa 1988).

Dreams reveal the dreamer’s situation as it is. They can present frank and direct commentary on the dreamer’s psychological reality. They can also encourage and support a dreamer to live his or her fullest potential. The more a dreamer attempts to move into alignment with his or her dreams, the more they may experience their own wholeness and connection to the direction and meaning of their life. Working with dreams

provides access to the fertile springs of the unconscious and widens awareness beyond the daily workings of the ego, allowing the dreamer to sense something of “that cosmic night.”

Dreams in the Old Testament

Erel Shalit

Israel Institute of Jungian Psychology, Ra'anana, Israel

All in all there are about a dozen dreams in the Hebrew Scriptures, the Old Testament (of the dreams in the New Testament, five, in Matthew,

pertain to divine guidance of the Holy Family; in Acts 2:17, Peter quotes Joel 3:1, and in Matt. 27:19, Pilate's wife shares with her husband a frightening dream and tells him to spare Jesus). However, what exactly constitutes a dream may be hard to tell. The distinction between dream and vision is not always apparent.

Besides Jacob's well-known dream of the ladder, we find the main elaboration on dreams in the book of Daniel, with Nebuchadnezzar's two dreams, and particularly in Genesis, with Joseph's dreams and interpretations.

The attitude towards dreams in the Bible is ambiguous. While Daniel and Joseph are celebrated dream interpreters, in other instances warnings are voiced against the deceit and falsehood of dreams. In Jeremiah, God ridicules and warns, "I have heard what the prophets said, who prophesy lies in my name, saying, I have dreamed, I have dreamed" (Jeremiah 23: 25), a warning repeated in other instances as well, for example, in Zechariah, "For the family idols have spoken vanity, and the diviners have seen a lie, and the dreams have told falsehoods; they give empty comfort" (Zechariah 10: 2).

In spite of the relatively few dreams in the Bible, and the warning against dreams as possibly deceitful, their absence may be a bad omen. This is the case with Saul, the first of the Hebrew Kings, who in despair before the battle in which his three sons are killed and he commits suicide, cries out, "God has departed from me, and answers me no more, neither by prophets, nor by dreams" (1 Sam. 28: 15). Saul had expelled the sorcerers from the country and was now cut off from the mediums, the channels of unconscious and transcendent communication with him.

Two kinds of dreams can be distinguished in the Bible, those which sound a command, message, or guidance of the Divine Voice, as with Abram and Abimelech, and the more symbolic dream, as we find with Pharaoh and Nebuchadnezzar.

Abram's Vision

In Genesis 15: 1 Abram, prior to God's changing his name to Abraham, has a nightly vision, which

opens in a rather typical way for divine messages to prophets: "the word of the Lord came to Abram in a vision." Abram is bewildered, but God tells him, "Fear not, I am your shield, and your reward will be great." God then brings Abram out in the night and tells him to look toward heaven and count the stars, promising a large offspring.

While in the Bible this is called a vision, some authors believe it to be a dream theophany, i.e., the visible, embodied appearance of God in a dream (Bar 2001, p. 148 f.). After the sun has set, Abram makes a sacrifice and falls into a deep sleep. God then makes his first covenant with him. This is the first biblical instance of dream incubation.

The Dream of Abimelech

The first reference in the Bible of a dream concerns King Abimelech. Abraham and Sarah had journeyed to the Negev, and Abimelech, king of Gerar, had sent for Sarah and "taken her," believing her to be Abraham's sister. "But God came to Abimelech in a dream by night, and said to him, Behold, you are but a dead man, because of the woman whom you have taken; for she is a man's wife" (Gen. 20: 3). The king declared his innocence, not having been aware that Sarah was Abraham's wife and, furthermore, he did not sleep with her. While still in the dream, God answers Abimelech, "Yes, I know that you did this in the integrity of your heart; for I also kept you from sinning against me; therefore I did not let you touch her" (Gen. 20: 6).

Abimelech listened carefully to what he was told in the dream and sent Sarah back to her (half) brother and husband, inviting them to live in the land. He was consequently rewarded with the renewal of life; the wombs of his house that previously had been closed up were now opened, and his wife and maidservants became pregnant.

Jacob's Ladder

The Bible's perhaps most well-known dream is Jacob's dream of the ladder (Gen. 28: 12). Jacob had set out on a journey to his maternal uncle

Laban in Padan Aram. When night arrived he lay down to sleep and dreamed of angels ascending and descending a ladder that reached to heaven. Above the ladder stood God, promising to protect Jacob and to bring him back safely. When he woke up, he decided to call the place Beth-El, the House of God.

The dream ladder may be a metaphor for the connection between heaven and earth, divine and human, or, within man's psyche, the connection between the personal ego on firm ground and the sense of divine presence in man's soul, the god-image, or the Self. The angels, as messengers and intermediaries, wander this vertical axis. In fact, ladder (*sulam*) is a *hapax legomenon*, appearing only once in the Bible, possibly originating in the Accadian word *simmiltu*, stairway, believed to be used by the gods to travel between different realms; at the top of the stairway was the entrance gate to the dwelling of the gods.

Jung referred to the theme of the ladder as pointing to "the process of psychic transformation, with all its ups and downs" (Jung CW 12, 1968, para. 80). Later, Jacob has another dream, in which he is told by an angel to return to his native Canaan.

Solomon's Dream of Wisdom

When inheriting the throne, King Solomon sets off to the sanctuary at Gibeon, northwest of Jerusalem. He presented burnt offerings and went to sleep to incubate at the sacred precinct, whereupon he dreamed a dream in which God appeared to him (1 Kings 3: 5 ff.). With Abram's vision, this is the Bible's most prominent case of dream incubation. In his dream, Solomon asked God to give him "an understanding heart to judge your people, that I may discern between good and bad." It is worthwhile to notice that the Hebrew says "a hearing heart;" the root of the word "hearing" [sh-m-a] is also the root of the word "meaning." That is, he asked for wisdom, and the wisdom of judgment, which he was granted. Immediately upon his return from Gibeon to Jerusalem, Solomon is asked to decide who of the two harlots is the mother of the living child, and whose is the child that has died. He judged

wisely that the one willing to forfeit the child rather than have it slain by the king's sword is the mother.

Nebuchadnezzar's Troubled Dreams

Four centuries after Solomon built the Temple, the one hand of Nebuchadnezzar rebuilt the city and the civilization of Babylon, while with his other hand he destroyed the Temple and the walls of Jerusalem. He told his magicians, "I have dreamed a dream, and my spirit is troubled," and demanded they interpret his dream, without even telling it to them. Unable to do so, Daniel was called upon, and in a vision of the night God revealed the mystery of the dream to him. Daniel explicated the king's dream, in which he saw:

A bright, awesome statue, head of gold, chest and arms of silver, belly and thighs of bronze, its legs of iron, its feet of iron and of clay. And then, a stone was cut out, but not by human hands. It struck the statue and the iron, the clay, the bronze, the silver and the gold were broken to pieces and became like the worthless straw on a threshing floor in summer. The wind swept them away without leaving a trace. But the stone that struck the statue became a huge mountain and filled the whole earth. (Daniel 2: 31 ff.)

Daniel told Nebuchadnezzar that his kingdom, his power, his strength, and his glory came from God. "You are the head of gold," he said. Then there will arise a kingdom of silver, inferior to yours, and yet another one of bronze, which will rule over all the earth, Daniel tells the king. A fourth kingdom, as strong as iron – strong, oppressive, crushing, and shattering, however "partly clay and partly iron, it will be divided" – powerful, yet frail, would then arise. At the end, the eternal, indestructible kingdom of heaven will crush and put an end to all these kingdoms, Daniel tells the king.

Daniel interpreted the four metals of the statue as four successive kingdoms. Nonpsychological interpreters have seen it as a dream that links the history of worldly empires, and it has thus been perceived as a prediction of the historical succession from the kingdom of Babylon to Medo-Persia and Greece, and on to Rome, from where the Kingdom of God would rise again.

Other scholars have compared the dream to Hesiod's stages in the moral decline of mankind. Psychologically, it may reflect the relentless process of increasing functionality, an increasingly strong ego, until the ego swells and is overcome by the transcendent, as represented by the stone "cut not by human hands."

However, Nebuchadnezzar remains arrogant; a "classic case of megalomania," writes Jung (CW 8, para. 163). His second dream, in which the tree in the midst of the earth, reaching to heaven, is cut down and the king turned into a mad beast for seven years, may be considered as compensatory to this inflated condition.

Joseph, the Dream Interpreter

The dreams of Joseph, the butler and the baker, and then Pharaoh, constitute the Bible's most prominent dream series. There are three sets of two dreams each. Joseph's second dream essentially repeats his first, and Pharaoh's dreams are identical to each other.

The doubling of dreams indicates the vital meaning ascribed to them, "that the matter is established by God" (Gen. 41: 32). While the dreams of the butler and the baker are similar and dreamed the same night, they are interpreted by Joseph as predicting their opposing destinies.

Joseph told his brothers that in his dream, their sheaves gathered around his and bowed down to it, and in his second dream, the sun and moon and eleven stars bowed down to him. He thus further aggravated his already angry brothers. From a psychoanalytic viewpoint, these dreams have been considered as a narcissistic manifestation of Joseph. Standing in the center of the earth's harvest and of heavenly counsel may then be understood as compensatory to his feeling of being rejected by his brothers.

The second set of dreams is those of his fellow prisoners in Egypt, Pharaoh's butler, and baker. The butler dreamed that he gives Pharaoh to drink from the grapes that he pressed from a three-branched vine. Joseph told him this means he will be restored within three days to his former rank. From the position of Pharaoh, which means

"the great house" and has been referred to as a metaphor for the ego, whose spirit we are told is troubled (Gen. 41: 8), it may indicate a renewal of the flow of wine, a necessary rejuvenation of spirit and consciousness. The positive interpretation of the dream makes the baker come forth, as well, to ask Joseph to interpret his dream as well.

In the baker's dream, the food for Pharaoh in the uppermost of the three baskets on his head is eaten by the birds. This time Joseph's interpretation is less agreeable, "The three baskets are three days; And within three days shall Pharaoh lift up your head off you, and shall hang you on a tree; and the birds shall eat your flesh off you" (Gen. 40: 18f). That is, in contrast to the flow of wine and the symbolism thereof, the produce of the earth will not reach the great house of Pharaoh.

Then, the meeting of the two protagonists – the Egyptian King who does not yet realize his kingdom is threatened by famine, and the Canaanite hero whose rise into royalty came to be followed by his people's fall into slavery – becomes the lysis of the dramatic series of dreams.

In his dream, Pharaoh saw seven thin and ugly cows come out of the river and consume the fat ones, without getting fatter, and seven thin and damaged ears spring up and replace the seven good ones. Prosperity is replaced by famine, like autonomous complexes may drain the ego of its resources (cf. Shalit 2002, p. 68 ff.). However, a conscious attitude may enable taking necessary precautions, as suggested by Joseph, who is appointed viceroy to prepare the land for the years of famine. Psychologically, an ego that attends to the manifestations of the soul by listening to dreams can apply conscious means of coping.

The name Joseph means "the added one." Besides interpreting Pharaoh's prospective dream, he added wise counsel. Pharaoh renamed him *Zaphnath-Paaneah*, understood to mean "through him the Living God speaks" or, psychologically, through him the voice of the self speaks. Literally, the name means the one, who "deciphers the encrypted message," thus acknowledging Joseph's gift of dream interpretation.

In summary, dreams are sometimes considered false and misleading (e.g., Jeremiah and

Zechariah) in the Hebrew Scriptures; at other times they describe the vertical axis between man and divinity (or ego and self; Jacob's ladder, or the statue and the tree of Nebuchadnezzar); sometimes Biblical dreams are divine visions, and sometimes they predict a person's fate or serve as spiritual guidance.

Drewermann, Eugen

Matthias Beier

Christian Theological Seminary, Indianapolis, IN, USA

The primary function of religion is to be therapeutic. This thesis lies at the heart of the influential work of German psychoanalyst, theologian, and philosopher Eugen Drewermann. Widely read around the globe since the 1980s, he aims to free religion from its anxiety- and violence-producing projections and to interpret the rich symbolism of religions in ways that

promote healing and wholeness for individuals and communities. Author of more than 80 volumes revamping theology in particular and religious studies in general in light of psychological, neurological, ethological, sociocultural, and natural science research, Drewermann radically challenges the implicit and explicit use of traditional conceptions of God by religious, political, and economic authorities to justify psychospiritual suffering and sociocultural forms of violence. He argues that religion needs psychological mediation to free it from literalistic rigidity and objectifying coercion and that psychology, in turn, needs religion in order to safeguard the human person against behavioral, sociocultural, genetic, economic, and other forms of reductionism, dissolution, and exploitation.

Four basic interrelated ideas of Drewermann's work will be highlighted in this entry: first, that the purpose of religion is to calm uniquely human forms of anxiety and that the measure of healthy religion depends on whether it increases or calms human anxiety; second, that a hermeneutics of religious texts and experiences is needed which pays equal attention to the evolutionary roots of religious symbols and to the vicissitudes of the subjective, historical human experience of self-reflection; third, that healthy religion is essential to a resolution of the human propensity to inflict psychological and physical violence; and, fourth, an exploration of the emergence of the notion of God as a person and its relation to the emergence of the human experience of personhood.

Born June 20, 1940, in Bergkamen, then a mining town in the Ruhr area of Germany, to a nominally Lutheran father working as a mining official and a devout Roman Catholic mother working as a homemaker, Drewermann was the youngest of three siblings and exposed to lasting impressions of allied air strikes that destroyed most of his hometown in the final years of World War II. Ordained as a Catholic priest in 1966, he soon found himself confronted as a diocesan priest in a German spa town with congregants suffering from psychosomatic illnesses and ethical dilemmas for which seminary training had ill-prepared him. Thus motivated to enter psychoanalytic training at the Göttingen Psychoanalytic

Institute, Drewermann's psychotherapeutic work confirmed the inadequacy of what he called a superego-oriented form of religion (Drewermann 1989) and argued for a religion oriented around the person-based experience of the I (*Ich*) or self. Simultaneously he began doctoral studies in theology at the University of Paderborn and philosophy at the University of Münster, earning a doctorate in systematic theology in 1976 with a dense three volume interdisciplinary study of Gen. 2–11 (1977–1978). Upon *habilitation*, Drewermann taught as *Privatdozent* for systematic theology at the Catholic Seminary of the University of Paderborn while continuing to work as a priest.

Integrating exegetical, psychoanalytic, cultural-anthropological, ethological, philosophical, and systematic-theological methods, the multivolume works *Strukturen des Bösen* (1977–1978) and *Tiefenpsychologie und Exegese* (1984–1985) provide the methodological foundation for Drewermann's prodigious output of commentaries and interpretations of biblical texts and pieces of world literature are the following: more than two dozen volumes of depth psychological commentaries on biblical texts, including each of the four gospels (1987–1988, 1992–1995, 2003, 2008–2009), the book of Acts (2011), the Luke infancy stories (1986, Engl.: 1994a), texts for Advent and Christmas (1990, Engl.: 1991c) and Lent and Easter (1991a, Engl.: 1994b), and most books of the Hebrew Scriptures (1994c, 1998c, 1999b, c, 2000b); popular depth psychological interpretations of two dozen of Grimm's fairy tales (1981–2007), Anderson's "Little Mermaid" (1997), and the Indian myth Milomaki (1991b); a historical novel on Giordano Bruno (1992), the Renaissance philosopher burned at the stake by the Inquisition; and interpretations of pieces of world literature such as Saint-Exupéry's *The Little Prince* (1984, Engl.: 1993b), Hermann Hesse's writings (1995), Dostoevsky's writings (1998a), Goethe's *Fairy Tale* (2000a), and Melville's *Moby Dick* (2004). His most recent series of volumes on the question of God in light of neurological (2006a, 2007), anthropological (1998b), biological (1999a), and cosmological (2002) research have made him a public focal point of the science

and religion debate in Europe. A prolific author gifted with the memory of a genius and the oratory skills of a Cicero, Drewermann is frequently featured on German-speaking TV and radio talk shows and presents some hundred lectures annually while continuing his clinical practice.

Turning to the first basic idea, Drewermann's synthesis of psychology and religion centers around the function of religion to calm uniquely human forms of anxiety. He distinguishes broadly three basic dimensions of human anxiety: the biological fear of death, the psychological/social fear of separation and insignificance, and the existential fear of nonbeing. In the face of the inevitability of death, existential anxiety raises biological and psychological/social anxieties through the self-reflective capacity of the mind to uniquely human absolute levels, as described by existential philosophers or psychologists from Kierkegaard and Sartre to Boss, Laing, May, or Becker. The human capacity for self-reflection consciously or unconsciously opens the abyss of nothingness to the personal ego, stirring absolute levels of anxiety the ego forever seeks to calm. Such anxiety often remains unconscious and may then manifest itself in character structures as petrified anxiety which, on the outside, seem socially adaptive to the group, e.g., the routinely obedient fulfillment of the duty of a soldier in World War II moving prisoners to concentration camps or of another soldier to engage in carpet bombing while calmly drinking a cup of coffee in the cockpit of his bomber plane. Since the abyss of nothingness is absolute and, Drewermann maintains in contrast to other existential writers such as Sartre, Camus, or Becker, can never be bridged by anything less than absolute, all attempts to bridge it with anything less than absolute, such as temporal achievement, relative cultural symbols, allegiance to institutions or leaders including religious ones, or clinging to self and others, inevitably fail to calm and, often, inadvertently increase absolute anxiety. Based on this analysis, Drewermann argues that interpretations of religious texts, doctrines, and experiences need to be guided by attention to the basic interpersonal alternative between anxiety and trust. In this context, he has developed diagnostic formulations of key theological dynamics in the experience of

depression, hysteria, obsessive compulsion, and schizophrenia (Drewermann 1982–1984, 1993a) and has provided a far-reaching critique of an alternative to the de facto voluntaristic bias in dominant conceptions of ethics in both Roman Catholic and Protestant notions of moral agency (Drewermann 1982–1984, 2001, 2006b, 2012a, b).

Drewermann's work is best known for his analysis of unhealthy forms of religion which led to his being officially silenced by the Roman Catholic church at the behest of then Cardinal Joseph Ratzinger, now Pope Benedict XVI, who wrote with alarm in a 1986 letter to the local archbishop that Drewermann's work had caused "grave concern" in the Vatican and instructed the bishop to take all "necessary measures" (Beier 2004, p. 17). Informed psychologically by Freud, Jung, Reik, Fromm, Kohut, Klein, Boss, Laing, Stern, and others, Drewermann expounds through interdisciplinary analysis dynamics that turn religious doctrines, beliefs, and institutions into the opposite of their original function: from calming anxiety and sublimating aggression to being the source of anxiety and violence, thus paradoxically blocking the way to a solution of both (Drewermann 1989, 1993a). "A reactive atheism due to disappointment" (Drewermann 1999a, p. 737, 2007, p. 425) is the inevitable and even necessary response to this poisoning of religion by fear. When Drewermann added to his depth psychological hermeneutic of religious texts an analysis of the Vatican's clergy ideal as practically requiring the sacrifice of the clergy's own personhood through complete identification with the office and called for radical therapeutic reforms of clergy training in his most controversial book, *Kleriker* (1989), he was, despite massive protests throughout Europe reminiscent of the Küng affair, stripped in 1991 of his license to teach Catholic theology and suspended in 1992 from his priestly duties. In the wake of a reunified Germany, Drewermann emerged as a cultural icon for a democratic and nondogmatic form of religion and has since been regarded in the public's eye as a "new Martin Luther" (*Time International*, August 24, 1992). Drewermann left the Roman Catholic Church on the day of his 65 birthday in June 2005.

The second aspect of Drewermann's work addresses the nature of religious symbolism and its relation to historical reality and truth claims. Historical criticism, comparative religious studies, psychoanalytic theory, and recent brain research provide insurmountable evidence that stories collected in sacred texts, for the most part, do not report objective "external" historical facts but rather poetic and narrative retellings of significant "internal" subjective experiences which, Drewermann, attempting to address the imageless Protestant vacuum created by the demythologization of the Bultmann school and dialectical theology, argues, are by no means less historical than physical events but rather more so because they transmit what a powerful experience meant to the people who experienced it or who were touched by it. The story of the virgin birth of Jesus, for instance, aims not to declare Jesus' mother Mary to be biologically a virgin but rather uses a motif resembling Egyptian mythology, where Pharaoh is declared as eternally being born of a virgin and son of God only from the day of his enthronement, to convey that the people who encountered Jesus experienced him as someone whose authority as a person was not born from humans but from God. As such, the symbol of the virgin birth became a democratic symbol expressing the belief that every person receives a place and right to exist in the world directly from God, thus relativizing all oppressive human authority, both internally and socioculturally. In the course of Christian history, however, this mythic symbol turned into the exact opposite when historicized and metaphysicized by Christian institutions as a "belief" to be accepted about the external historical state of Mary's sexuality and thus used to control the private lives of people.

While Drewermann's analysis focuses primarily on Christian symbols and dogmas, it always takes place within the comparative study of religions (Drewermann 2000c). Such study shows that the *content* of key symbols of Christianity, such as virgin birth, cross, resurrection, ascension into heaven, walking on water, or transfiguration is not unique to Christianity but is shared among the world's religions. The uniqueness of

Christianity must be sought not in the content of its symbols but in the *way* those symbols function(ed) to express the process of calming unique human anxiety through an encounter with the person of Jesus who, as evidenced by the signature phrase “Do not be afraid,” portrayed God ultimately as the one who can be absolutely trusted and need not be feared. The Christian use of what Freud, Jung, and their varied followers recognized as universal images or archetypes of the psyche and what ethology terms “innate release mechanisms” is decisively therapeutic. The universality of psychic imagery, albeit in sociocultural variations, allows stories from the past to be read as personal stories in the present. Central to Drewermann’s thought is that the message of Jesus aimed to heal religion itself from the ambivalent projections into the God image and from the violence so often done in the name of God intrapsychically, interpersonally, and between groups.

This leads to the third key aspect of Drewermann’s work: his analysis of the violence of religion and of religious motivations involved in waging war. Following a scathing eco-theological critique of the exploitation of outer and inner nature due to the anthropocentrism of the Judeo-Christian world view (Drewermann 1981) and a radical critique of Christian ideas which inadvertently promote a culture of war (Drewermann 1982, 1991d), Drewermann emerged during the first Gulf War as the most outspoken German antiwar activist. He received the 2007 Erich Fromm Prize for his tireless efforts to fight war and anti-Semitism and to promote peace and social justice. He calls war a disease and sees it as an attempt to solve by material means conflicts that can only be solved by addressing the absolute fears around needs of recognition, existence, and shame that fuel wars and lead to compensatory cultural God-like claims to absolute moral superiority, truth, and power. In war, an abstraction from feelings of empathy takes place, and reason goes mad with fear while creating rationalizations for a supposed necessity to inflict violence in order to fight violence. In addition to the analysis of economic, historical, sociocultural, and political reasons for

wars, an analysis of what is spiritually at stake in violent conflicts is essential. Efforts at peace and social justice so often fail because they are guided by moralistic splitting of the world into absolute good and evil in which the “good” feel justified to use all means possible and thus inevitably come to perpetuate the cycle of violence by trying to solve it through further self-righteous violence. Jesus’ message of peace and Ghandi’s and Martin Luther King’s nonviolent calls for civil disobedience guide Drewermann’s own vision for an active and psychologically convincing form of conflict resolution (Drewermann 1996).

In a postmodern world leaving behind the early Christian councils’ Greco-Roman speculations about the divine cast within a type of thinking in terms of metaphysical being or substance as well as the Thomistic theological pseudo-rationalism, Drewermann argues in light of neurological, biological, and cosmological research that popular conceptions of the soul or spirit as a kind of substance or energy and of Christ as a being or substance ruling from above are no longer tenable (Drewermann 2006a, 2007). Similarly, tempting as it may be, God can no longer be thought of in natural philosophical terms of a principle of explanation for first causes nor for why the world is as it is. Modern sciences, as atheists like Dawkins or Dennett have argued convincingly, do not need the God hypothesis in order to explain anything in the universe. Religion, and specifically belief in God, does not *explain* the world, but rather emerged anthropologically and is needed existential-philosophically to *interpret* the world so that humans do not go mad in the face of the cruelty, indifference, and senseless suffering in nature (Beier 2010). Discussing the alternative approach of Buddhism on how to deal with suffering and nothingness, Drewermann argues based on neurological research on consciousness and self-awareness and on modern infant research conducted by Daniel Stern and others that the conception of the divine as a person is indispensable in a therapeutic form of religion. While Drewermann agrees with the analysis of existential philosophers and psychologists on the radical nature of anxiety, he argues that “ontological insecurity” (Laing) requires a genuinely religious

answer in which religious symbols become catalysts for a calming of existential anxiety in an unconditionally accepting encounter with an absolute person, called God in religions. This experience occurs through the interpersonal human experience of love and then extends to our encounter with the nonhuman world in the form of compassion. It need not necessarily involve God language to occur. Without an absolutely accepting person in the background of the world, all religious symbols remain open to ambivalent uses for purposes of oppression. The idea that God must be imagined as a person is not meant to make an objective statement that can be abstracted from personal, subjective experience. Applying the notion of therapeutic transference developed by Freud and his school (rather than Girard's notion of mimesis), Drewermann holds that for humans any calming of personal anxiety at the deepest level inevitably occurs by means of the psychic language of the personal dimension. To humans, God becomes most personal in the form of a person. In this sense, the religious is always personal and the personal is always religious. It is religion's function as a remedy for anxiety that requires humans to conceive of the absolute as an absolutely trustworthy person, God. Only in this context can the Cross, so often interpreted in sadomasochistic ways when conceived projectively as something God did to Jesus or as Jesus sacrificing himself to God for humans, become a symbol for working through human aggression by placing it where the cycle of violence can be broken: onto God who is conceived of as being able to suffer the aggression without feeding the cycle of retaliation and counterviolence. Though God, Drewermann argues with Kant, can never be proven to exist objectively as a person apart from subjective human experience of the divine but is in a way always bound to the projective mechanisms of the human mind and thus remains a postulate, the subjectivity of this experience does not exclude an objective reality corresponding to it, just as all of our experience is by definition subjective in the sense that we are the experiencing subject of it and yet can at the same time correspond to an objective reality beyond our senses. Religion only

becomes mere projection in the sense of the Feuerbachian critique when it is used by external religious or quasi-religious secular institutions to alienate humans from themselves rather than enabling them to truly unfold freely as unique persons in relation to each other. Experience of God, for Drewermann, is by definition poetic, and the attempt to explain the existence of God by objective means would be equal to confusing explanations about hormones with the ecstatic experience of love or explanations about syntax with the rapture experienced at the reading of a poem.

Drives

Stefanie Teitelbaum

Faculty of National Psychological Association for
Psychoanalysis (NPAP), New York, NY, USA

Institute for Expressive Analysis (IEA),
New York, NY, USA

Introduction

Freud used the words *instinkt* (instinct) and *treib* (drive) seemingly without organized differentiation. Opposing forces or dualism characterized Freud's thoughts about instinct, in both the nature of the instinct itself and in the source of the force as being of the mind or the body. Freudian instinct differs from strictly biological instinct in the uniquely human consciousness to mentalize the pressure to respond to a sometimes consistent presence of an urge with or without identifiable stimulus. The vast variety of urges to act within the human species, sometimes deemed pathological, might also suggest forces not strictly rooted in the body.

Drive, as used in Freudian psychoanalysis, does not have a distinct role in religious/psychological literature. Religious texts referring to pressure to act generally speak of instinct or inclination, sometimes conceived as divinely implanted.

Psychoanalysis

Freud conceived the instincts as amoral. The psychological forces taming, transforming, or renouncing the instinctual drives are (1) the death of the totem father, causing the internalization of the taboo against incest (Freud 1913/1962), and, more important, (2) the super ego. These forces of civilization might be viewed as more psychically determined drive within a dualistic framework as they are value-laden. Freud, however, considered the prohibition against incest to be phylogenetically determined, pre-dating the domestication of animals.

Commentary

Kernberg (1992) summarized the differences of the terms: instinct is a biological force, and drive is a psychically determined force of human nature. The differences only exist in a schema wherein the mind and body are clearly separate. The instincts are proactive and reactive to the demands of the life and death of the body. The drives appear to take on a life of their own, related to the demands of psychical life and death (Kernberg 1992; LaPlanche and Pontalis 1973). The distinction between instinct and drive appears to be of interest to psychoanalytic theorists and, even in those circles, an arcane interest.

The concept of a frontier, an in-between state, is present throughout Freud's lifelong writings. He poetically positioned instinct as residing on the frontier between body and mind (Freud 1905). The great dualist struggled with his dualism, and the forces, on the frontier between mind and body, driving towards unity and destruction.

Dualism

Hillary S. Webb
Goddard College, Portsmouth, NH, USA

Dualism Across the Domains

“Dualism” (from the Latin *dualis*, meaning “containing two”) refers to a philosophical system or set of beliefs in which existence is believed to consist of two equally real and essential substances (such as mind and matter) and/or categories (such as being and nonbeing, good and bad, subject and object). Dualism contrasts with *monism*, the theory that existence ultimately consists of only one thing or essence, and also with *pluralism*, the belief that existence is made up of many things or essences (Ajaya 1983; Gordon 2005).

Although the term can be applied to much earlier philosophical and religious traditions, “dualism” as an ontological designation was first used in 1700 by the philosopher Thomas Hyde as a means of describing religious systems that conceive of God and the Devil as coeternal (and therefore equal) principles. The term was later introduced into philosophical discourse by the German Idealist Christian Wolff as a way of categorizing philosophical systems that conceive of mind and matter as distinct and irreducible substances. Rene Descartes further separated mind and body within what came to be known as “Cartesian dualism.” After this, the term “dualism” as a philosophical concept became most frequently applied to issues surrounding the “mind-body problem” – a philosophical conundrum that considers how the seemingly distinct substances of

the immaterial mind and the material body causally interact (Gordon 2005; Stoyanov 2000).

While in Western philosophical dualism the fundamental debate centers on the primacy of mind versus body, when applied to the field of religious studies, “dualism” is most widely used in regard to belief systems that either conceive of two supreme and opposing principles such as “God” and “Devil” or those that create a sharp distinction between the “profane” (the world of day-to-day physical existence) and the “sacred” (an intangible, transcendent, and – in some cases – more “true” or “essential” reality). The Western world’s study of the human psyche has likewise created various splits or dualisms, including (but not limited to) the relationship between society and the individual, nature and nurture, and mind and body. In the seventeenth and eighteenth centuries, Wolff divided the study of the soul into “rational psychology,” which examined the human soul and argued for its immortality, and “empirical psychology,” which aimed to identify psychological principles on the basis of the soul’s worldly experiences. Later on came the division of psychological disorders into “organic” (biologically based) and “functional” (mental-emotional) pathologies, with the former orientation emphasizing the explanation, prediction, and control of behavior or cognition and with the latter focusing on the subjective experience of the individual as a means to understand and treat psychological distress (Teo 2007).

A Preoccupation with Polarity

It has been argued (Levi-Strauss 1963; Maybury-Lewis 1989a; Needham 1973) that all cultures across time and space identify and make meaning of the world through “binary oppositions” – dyads of complementary or opposed elements such as male–female, good–evil, and spirit–flesh. Some (Levi-Strauss 1963; Maybury-Lewis 1979, 1989a, b; Needham 1973) believe binary opposition to be the most fundamental category through which the human mind organizes itself and that the frequency with which this form of classification arises within and across

cultures is evidence that “bipartization,” or the impulse to conceive of the world as split into a duality, is hardwired into the human psyche. Given this “preoccupation with polarity” (Maybury-Lewis 1989a, p. 6), it has been suggested that much of human consciousness is devoted to trying to understand and mediate the relationship of the opposites.

The way in which a culture envisions the relationship between the polarities is one of the most significant and distinctive features in any ontological model. Within religious traditions exhibiting an *antithetical dualism*, one side of the pair is often seen as being responsible for the creation and preservation of the cosmos with its opposite being the “negative” or “evil” aspect that seeks to unmake creation. Stoyanov (2000) split religious systems of this type into several categories based upon the extent to which (and the *ways* in which) this opposition manifests. For example, he noted that within systems that exemplify an *absolute dualism*, the antithetical relationship of the opposites is, as the term implies, absolute, in that the opposing forces representing good and evil are believed to have originated from two independent, coeternal principles that always have been and always will be separate. Classic examples of *absolute dualism* are the “dualist monotheisms” of Zoroastrianism and Manichaeism, two early religious systems that made the antagonistic struggle between good and evil the fundamental principle of their religion. However despite both being forms of absolute dualism, Manichaeism and Zoroastrianism show significant differences in how this antithetical struggle is played out. For example, in Zoroastrianism, it is believed that the physical world, including the human body, is an expression of the positive aspects of the “good” principle. This belief is referred to as *cosmic dualism*. Manichaeism, on the other hand, as an example of *anti-cosmic dualism*, equates the profane world and its manifestations with the principle of evil (Stoyanov 2000).

In contrast, other systems exhibiting an *antithetical dualism* subscribe to a kind of *moderate dualism* in which one of the two opposites – typically the “evil” side of the equation – is considered to be a secondary principle, one that

has its origins in the primary and more supreme principle. Some of the classic Gnostic movements are included in the category. Despite these ontological differences, philosophies of *absolute dualism* and *moderate dualism* both share the fundamental belief that the aspect considered to be “negative” or “evil” should be rejected and/or destroyed. It has been noted (Ajaya 1983) that within this context, the human experience is perceived to be an unending struggle to distinguish that which is the “good,” “creative,” or “real” aspect and that which is “evil,” “destructive,” or “illusory.”

While a philosophical model based on an *antithetical dualism* accentuates the struggle and antagonism between the opposites, other systems of thought perceive the polarities as being ultimately *complementary* in nature. Within a dualism of complementary terms, the underlying ontological belief is that everything has a counterpart without which it cannot exist. Philosophical and religious systems based upon forms of complementary dualism (e.g., Taoism and many indigenous, “shamanic” belief systems) maintain that existence is dependent upon the tension and balanced interchange between the polarities. Because they are interdependent and mutually supportive, resolutions or disturbances occurring in one side of the equation evoke a sympathetic response in the other. Therefore, if one side is destroyed or denied, the other will suffer to an equal degree (Hertz 1973; Maybury-Lewis 1979, 1989a; Needham 1973; Tuzin 1989; Watts 1969; Webb 2012).

While certainly acknowledging the tension created by the opposites, philosophical models based on a complementary dualism are marked by their dedication to maintaining an equilibrium and harmony between them. Maybury-Lewis (1989a) stated that, “[Complementary] dualistic theories insist that these antitheses do not tear the world apart, and humankind with it, because they are part of a cosmic scheme in which they are harmonized” (p. 14). Within these cultures, “complementarity” becomes the major organizing principle within all aspects of community life, from the social to the spiritual.

Dualism in the Psyche

It has been noted (Jung 1953/1956; Myerhoff 1974; Tarnas 1991; Watts 1969; Webb 2012) that Western philosophical and religious systems have historically tended towards a dualism of antithetical terms, with a corresponding belief that the tension created by the polarities can be resolved only through an elimination of the undesirable aspect of the pair. Myerhoff (1974) reflected, “Unfortunately, we westerners have come to feel that enduring this sort of tension is not really necessary, but somehow it is possible to allow one pole to exist and prevail without its opposite. We see good without evil, pleasure without pain, God without the devil, and love without hate” (p. 102). Likewise, Watts (1969) noted that, “By and large Western culture is a celebration of the illusion that good may exist without evil, light without darkness, and pleasure without pain, and this is true of both its Christian and secular, technological phases” (p. 48).

The Western world’s devotion to what Jung (1953/1956) referred to as “neurotic one-sidedness” (p. 42) is evident in a certain intolerance of the complexity of the psyche, one that often results in a compulsion to eliminate all paradoxes and seeming contradictions of the human condition. A 2007 *Time* magazine article, entitled “What Makes Us Moral” gives an example of this. The article begins with the following sentiment:

“If the entire human species were a single individual that person would long ago have been declared mad. The insanity would not lie in the anger and darkness of the human mind – though it can be a black and raging place indeed. And certainly it wouldn’t lie in the transcendent goodness of that mind – one so sublime, we fold it into a larger ‘soul.’ The madness would lie instead in the fact that both of those qualities, the savage and the splendid, can exist in one creature, one person, often in one instant” (Kluger 2007, p. 54).

According to this article, it doesn’t matter which we choose – either the “splendid” or the “savage” – as long as we align ourselves thoroughly and completely with that one side without deviation. Only then can we be considered healthy and sane. While over the years there have been a

number of Western thinkers who have argued for the necessity of balancing the opposing forces within the psyche (Jung and Watts most notable among them), the dominant Western psychological perspective tends to be that the individual must choose between the opposites – either the splendid or the savage – and align oneself thoroughly and completely with it without deviation (See Webb 2012).

Duende and Psychoanalysis

Claudia Bader

Institute for Expressive Analysis, New York, NY, USA

Duende is a term used to describe artistry empowered by the awareness of death. It has

similarities to the idea of “soul,” in art and life, but although both share the sense of tragedy or pain moving the creative energies, duende is libidinally charged, having more fire and drama in it.

The term duende comes from popular Spanish culture, created from the phrase Duen de Casa – Master of the House. This refers to a poltergeist-like trickster figure that makes a general irritation of its self by hiding things, breaking China, and making noise. However, there was another usage of the term that comes from Andalusia, where great artists are said to have duende, inferring that they are in contact with this force. Great bullfighters, singers, and dancers are graced with this description. Duende becomes a personification of, and resonates to, daimons, muses, and/or demons; it is an energy that moves through the body and soul. It is described as a possession as much as a talent. In this guise, duende takes on a chthonic quality, pulling inspiration from the depths and bursting through the artist to the audience.

Awareness of death is an intrinsic aspect of duende. Destructive and creative energies are very close to each other when the duende is invoked. The whisper of death suffuses their art, and this awareness of it drives life. Thus, Manuel Torre, who was a great flamenco singer, can make the statement that “all that has black sounds has duende” (Torre, quoted by Lorca, p. 49, 1933). The thrill and terror of contact with death, the ultimate mystery and realm of the unknown, is what brings depth of expression and allows the performer and the audience to soar.

The person responsible for bringing the concept of duende out of Spain onto the international stage was the Spanish poet and playwright Federico Garcia Lorca (1898–1936).

A charismatic figure, Lorca was deeply involved in the intellectual and creative life of the time. He had close relationships with Bunuel and Dali and was an influence on Pablo Neruda. Lorca was obsessed with his death and would even stage mock funerals for himself with his friends.

The idea of duende as an artistic force was integral to his thinking from at least 1922 when he gave a lecture, “Deep Song,” at a music festival

for the musical genre called Cante Jondo – deep song.

His ideas about deep song became the foundation for his poetics.

The time in between 1922 and 1933, he was in New York writing “a Poet in New York”; listening to jazz, blues, and African-American spirituals; and studying English at Columbia.

In his contact with professional singers (cantaors) and dancers (bailaors) of Spanish music, Garcia Lorca came to appreciate the difference between a good and bad performer.

The difference was simple. . . he said that good performers have duende, and bad ones never, ever, achieve it. The good singers sing with their whole body, the sound moving from the chest, not the throat. Good dancers pull the energy up from the earth. These performers with duende have “black sounds.”

Black and its various symbolic variants are crucial for duende, and this relationship to the dark and its gifts and trials is crucial for psychoanalysis as well.

The source of the symbolism related to black is rooted in the fact that we are diurnal animals. We humans are most dependent upon our sense of sight. If we go back in time to our experience in nature before artificial light, night is the most dangerous time for us. We are at our most vulnerable in the night, for without light we cannot see. When we sleep, things go dark, and we are helpless at that time. We are unconscious and enter another reality. Additionally, the association of death with black comes naturally since in death we are unconscious permanently. As with all symbols, individual associations to black evolve dependent upon a combination of archetypal factors and a person’s individual psychic structure and experiences.

Duende’s relationship to death resonates with psychoanalytic concepts. Freud coined the term death instinct. He wrote about this in *Beyond the Pleasure Principle* (1920). The death instinct is more commonly called Thanatos.

Freud was always close to an organic orientation, and when he formulated the idea of the repetition compulsion and its stubborn adherence to early patterns, to NOT changing, Freud came to

the conclusion that the fundamental aim of all instincts is to revert to an earlier state, a regression.

He came to see a battle in the psyche based in biology; life, affiliated with libido, pitted against the drive to death and entropy, the death instinct. When Melanie Klein developed her ideas on the death instinct, these forces took on a different quality.

Melanie Klein was deeply influenced by the idea of the death instinct and saw it as an active, intense force in the psyche in contrast to Freud who saw it working in the background. In Klein’s work with children, she observed intense destructive levels of aggression in their play that outbalanced the loving, joyous, positive libidinal aspects of play. She elaborated on the power of the death instinct by describing “envy,” an early state in which aggression directed against the life of the subject is directed against anything that supports or is a source of life.

It is difficult to observe Thanatos in its pure form in reality, but art can create images where we might actually get some sense of what the pure form might look like. Mythological monsters and demons and crazed villains in movies and plays open us to the raw expression of the darkness.

A common thread in these villainous characters is their grandiosity and narcissism. They strive to annihilate all difference, because the only thing allowed to exist is themselves. Drenched in Klein’s envy, they want to destroy life. This kind of character resonates to the myth of Saturn/Kronos, who, upon hearing a prophecy that one of his children would overthrow him, ate his children.

In a world that does not allow difference, there cannot be an other; without an other, there can be no relatedness and no object relations. When there is no relatedness, death can result. Spitz discussed this in relation to “hospitalism.” He reported that infants did not thrive, and some died that were not cuddled, held, and related to, even if they were fed and changed.

The body is important in duende; Lorca quotes an unnamed virtuosic guitarist describing duende as climbing up from the soles of the feet. Resonating in the body, the singing comes from

the chest and belly, not from the throat. Duende's black sounds emerge from deep feelings. Mourning, rage, and love, the forces of destruction and creation, are closely connected. An artist with great duende contains and expresses these.

In psychoanalysis, appropriate mourning and grief are crucial in healing. Psychoanalytic work demands great presence in the face of extreme affect states. The analyst needs to create the container in the rhythm of time and contact in order to help negotiate and midwife real mourning.

Christopher Maurer describes four crucial elements identified as Lorca's vision of duende: irrationality, earthiness, a heightened awareness of death, and a connection to the diabolical.

In these four elements, more aspects of working psychoanalytically come up:

1. *Irrationality*: working with feelings and impulses.
2. *Earthiness*: as a recognition of mortality, that we are in a body that dies; then, the channel of expression through the body. The cantaor (singer) with duende sang from his chest and not his throat.
3. *The awareness of death*: the death instinct and the contrast of the drive for life. The importance of mourning in the process of healing.
4. *Connection to the diabolical*: allows for aggression, sadism, all the Thanatos-driven feeling states.

Duende and Projective Identification

Another aspect of duende resonates with the psychoanalytic concept of projective identification, the condition where the patient, unable to tolerate their own feelings, cuts them off and projects them into the psychoanalyst. In this case, the psychoanalyst feels the feelings of the patient.

Duende, in its guise as a daimon/muse/demon, is described as seizing both the performer and the audience. It is a right brain experience, beyond intellect. This seizing is an excellent description of what projective identification feels like. However, in this case, the resonant effect is a result of

the presence of duende, and the performer is not cut off from feeling.

Duende and the Alchemical Mercury Archetype

Duende can be understood as an aspect of a larger archetype, mercury. As in all alchemical imagery, the symbols start with the actual chemical substances and processes used in alchemy. Mercury has a special place in these, for mercury is described as both the alchemical process and the goal of the process. Both duende and mercury are paradoxical: a "who" and a "what" destruction and creation.

In descriptions of mercury in alchemical texts, mercury is seen as a combination of substances, having many different qualities which all refer back to the properties of quicksilver. This is called "common mercury." Chemically speaking, this comes from the fact that quicksilver served as a universal solvent.

However, mercury is often called "Our Mercury." In this manifestation, mercury gains a capital "M" and takes on a different character. "Our Mercury" is a substance, source, and process all at once. "Our Mercury" is a substance, the source, and a process all at once. It is transformation its self, intrinsic, coming from the matter/substance that is undergoing the change. In the transformation, it devours its self and then recreates its self. The name, "Mercury," is given to all stages of this death/rebirth cycle.

The juxtaposition of a destructive and creative process fits duende. Duende is referred to as both a presence, the duende, in its guise as daimon/muse/demonic earth spirit, and a process, what is being expressed emotionally and spiritually in performance or in creative process. This slippery quality that encompasses both process and presence is also a way of conceptualizing psychoanalysis. As psychoanalysts hold the space for patients with their therapeutic presence, they also facilitate process occurring. So there is both stillness and movement in the same space. This combination of process and presence resonates with themes from the alchemical mercury archetype as well as duende.

Dunbar, Helen Flanders

Curtis W. Hart
Weill Cornell Medical College, New York, NY,
USA

Dunbar's Life

Helen Flanders Dunbar was a medieval scholar, a seminary graduate, and a practicing psychiatrist with an abiding interest in psychosomatic medicine. She was born into a well-to-do family in

Chicago in May of 1902 and suffered from a variety of illnesses of unclear origin as a child. She was raised primarily by three strong women who invested a great deal in her. They were her mother, her aunt, and her grandmother, all of whom anticipated great accomplishments in her future. She graduated from the Brearley School in New York and went on to attend college at Bryn Mawr where she majored in both mathematics and psychology with an interest in psychology of religion in particular. Dunbar then undertook graduate studies in Comparative Literature at Columbia and attended Union Theological Seminary at the same time. At Union, she met Anton Boisen who engaged her interests in the clinical training program for clergy and seminarians that he was starting at Worcester (Massachusetts) State Hospital. Dunbar went to Worcester in the summer of 1925 where she worked tirelessly in the department of social work studying symbols and symbolization in schizophrenia. Her interest in the clinical training she received with Boisen and others at Worcester combined with her curious and idealistic nature led her to become the first Medical Director of what was then called the Council for Clinical Training for clergy, even as she went on to complete her medical studies at Yale.

A practicing Episcopalian, Dunbar retained a connection to both the church and the medical establishment. As a physician, she showed herself to be an adept institutional politician and an outstanding theorist in the area of psychosomatics. She had a central role in and became the founding editor of the highly esteemed professional medical journal *Psychosomatic Medicine*. She completed a major study *Emotions and Bodily Changes* (1935) that went through several subsequent editions. She held several prestigious positions in the dialogue between religion and medicine and maintained an ongoing interest in furthering the formal, scientific study of the relationship between faith and health. Never one to avoid controversy, Dunbar became involved in confrontations and controversies with male colleagues in both medicine and religion over issues of gender, power, and authority as much as they had to do with theory and professional practice. Dunbar was

not actively involved with the clinical pastoral movement and Anton Boisen in particular much after the late 1930s, but her commitment became rekindled just prior to her untimely death in 1959 from drowning in a swimming pool following a heart attack at her home in South Kent, Connecticut, in 1959.

Dunbar's Legacy

Dunbar's legacy is complex in both medicine and religion. Her writing displays an erudite and sophisticated appreciation for the interplay of mind and body and psyche and soma. She was greatly interested and expended considerable effort investigating the role of symbols in explaining and understanding illness. Her own study of medieval literature, and Dante in particular, informed her therapeutic approach. The book she wrote arising out of her doctoral thesis at Columbia, *Symbolization in Medieval Thought and Its Consummation in the Divine Comedy*, was first published in 1927 and was republished at the time of her death in 1959 and remains a classic in its field.

It was out of her thinking and writing in theology and medieval studies that she came to understand the depth and power of symbols as they relate to medical and psychiatric symptoms. Symbols potentially provide structures for meaning about the relation of body, mind, and spirit. For Dunbar, symbols call attention to the whole that is always greater than the sum of its parts – a person with a family and a history or life narrative that develops or displays signs of dysfunction at a specific time in life and is under the influence of both inherent predispositions and immediate life stressors. Dunbar's views in these matters reflect a thoroughgoing sense of organic and holistic thinking, where for her the parts or dimensions of a person are not separate or discreet entities but interdependent and dynamically related components affecting one another. Her views on these matters anticipated by a generation in medical education and practice what is known as the "biopsychosocial model." Her understanding of healing in medicine and psychiatry was informed

by what is often thought of as the property of a medieval world view known as the "organic functional ideal." Dunbar's views are at the same time a reflection of the powerful influences upon her of both John Dewey and Alfred North Whitehead. Dunbar was a challenge to the medical world as well as to those she encountered in the ministry and the religious establishment both because of her gender and for her highly original perspectives. She could persuade, charm, and confront others. She was known to be a gifted and much sought-after therapist. Her ideas were informed as much by her theological and medieval and literary studies as by her medical and scientific endeavors. Helen Flanders Dunbar thus remains a prophetic and intriguing figure in the dialogue between medicine and religion.

Durga

Laura Amazzone
Yoga Philosophy Program, Loyola Marymount
University, Los Angeles, CA, USA

Worshiped in both orthodox Hindu and Tantric folds, Goddess Durga is a goddess of strength, courage, and justice. She is the embodiment of Shakti, the creative dynamic energy or power that animates and pervades existence. While her myth,

qualities and iconography do not radically change within the various sects in which we find her in South Asia, her Shakta Tantric expression as a Goddess of Paradox and Invincible Power and as the Remover of Fear and Difficulty can teach us much about navigating the complex terrain of emotions that are triggered through every encounter and experience.

Tantra is a living philosophy that has ancient roots in earth-based, shamanic culture. While there are over 64 schools of Tantra, we can look to tantric tenets; specifically, in the female-centered Shakta tradition (circa 1500 BCE–700 CE) that challenge the status quo, question authority, and teach us to draw from an internal sense of spiritual power in order to face and transform suffering. Ultimately, Shakta Tantrism is a path of empowerment and spiritual liberation. Tantric rituals and practices teach us to consciously engage with the paradoxical nature of life. Tantra invites us to go beyond dualistic black or white thinking and to take a tantric both/and approach to life. The mythology, qualities, and iconography of tantric deities like Durga model a more centered and composed approach to life's difficulties. Durga's seemingly contradictory nature is paradoxical: she is compassionate and wrathful, nurturing and fierce, independent and relational, and can serve as a useful spiritual and psychological guide.

Durga's Mythology and Qualities

Durga's fifth century myth from the *Devī Mahatmya* can be read as an allegory for the suffering and afflictions in our minds. This epic narrative describes Durga engaging in a series of battles with *asuras* or demons that are destroying the equilibrium of the earth. From a psychological perspective, these "demons" are actually afflicted ego constructs: ignorance, greed, rage, fear, and doubt. Durga represents the invincible pillar of strength and divine wisdom within. Each battle between Durga and various demons demonstrates how the proliferation of our negative thoughts can take over and govern our behavior in adverse ways. Despite the intensity of the conflict, we witness how Durga's strongest quality is her

composure. She does not lose her temper, she does not expend extra energy, nor does she run away in fear. Instead her approach is measured and contained. Durga stays centered amidst the tumultuous battles. She displays the confidence and courage needed when approaching any problem that arises. Working with Durga energies teaches us to practice nonattachment and nonjudgment. Rather than trying to control, resist, or fight difficult or unpleasant situations and people, Durga and her myth remind us to release our expectations about how things should be or look. The annihilation of the demons is actually a metaphor for the slaying of the ego and a return to our divine Durga nature. Even when we are faced with the more difficult life experiences, for example, loss, death, or illness, there is always an opportunity for spiritual and emotional growth and transformation. Durga's dynamic qualities and victorious defeat of the demons in the myth remind us to remain open to creative solutions (Fig. 1).

Iconography

Durga rides on a tiger or lion wielding various weapons and tools in her 8–18 arms. She appears calm, yet ready to take on any and every experience. One of the meanings of the name Durga is "fortress." Durga teaches us about psychological boundaries – who to let in and when; who or what to keep out. Sometimes we need to build a "fortress" around our self for protection, to focus, or to create peace. Other times this fortress can become a prison – especially when we are withdrawing from life or our relationships out of fear of intimacy, failure, or whatever in our life and psyche is causing us to put up walls. Knowing when our own "fortress" is needed and when we are creating a prison and self-imposed limitations is one of Durga's deepest teachings. Discernment goes hand in hand with her fiercely compassionate nature. Meditation and visualization practices are integral to Shakta Tantric practices. The iconography of deities serves as a guide for practitioners when working with psychological issues and emotional challenges. Durga's arms hold different weapons and tools such as the sword, bell, spear,

Durga, Fig. 1 Indian Goddess Durga, with ten arms riding her lion
(Courtesy of the author)

D

bow and arrow, club, trident, noose, and lotus. These can be understood as liberating symbols that help us transform and release negative emotional and mental afflictions.

Durga carries a sword, symbolic of severing our attachments, especially to unhealthy relationships, behaviors, and life situations. Often described as a symbol of discernment or discriminating wisdom, the sword can help us to be discerning in our relationships, to have better boundaries, to know when to say no and when we are being too rigid and inflexible. Durga's bell is a tool to dispel negative energies. The resonance of the bell's tones clear the air of negativity and summons peaceful and clarifying energies. Durga's spear reminds us to pierce the heart of any matter – especially when it comes to getting clear on what our heart's true desires are. Her bow and arrow are symbolic of focusing our minds, directing our will, and summoning the confidence to hit the mark of whatever we set our intention on. Her club encourages us to beat a new path, to tread where no one else has. Her trident points to the benefits of sharpening the

mind so that we can be clear and direct about our many choices and decisions. The three prongs remind us of the essence of Shakta Tantra to look for opportunities to create synergy and integration rather than opposition and separation. Her noose helps us to reel in that which is needed along our journey. Her lotus is a quintessential tantric symbol along this paradoxical path of life. The roots grow out of the mud and upward through murky water till the lotus blossom pushes through the water and rests peacefully on the surface. Despite our own and others' ignorance symbolized by the muddy water, there is a force within us that will always propel us toward growth and liberation of heart and consciousness.

Durga is a Goddess of spiritual authority, deep embodied wisdom, and invincible power. Engaging in meditations, ritual practices, and studying the Shakta Tantra teachings around this Goddess allows us to work with her mythology, iconography, and qualities in order to deepen our relationship with ourselves and to live a more peaceful and balanced life.

Dying and Rising Gods

Lee W. Bailey
Department of Philosophy and Religion, Ithaca
College, Ithaca, NY, USA

An ancient text says, as James Frazer worded it, “Heracles on his journey to Libya had been slain by Typhon and brought to life again by Iolaus, who held a quail under his nose: the dead god snuffed at the bird and revived” (Frazer 1922, section 224).

This is a short version of the many accounts of gods and semi-gods who were said to have died and been resurrected, well documented in the eastern Mediterranean region. This one is associated with the migration of quails that descend in hordes on Palestine/Israel in spring to breed.

James Frazer

The classicist James Frazer (Cambridge University), in his 1890–1915 encyclopedic *The Golden Bough*, collected a mass of reports of ancient authors and nineteenth-century travelers about archaic rituals, myths, and traditions. It is a classic compendium of fascinating material, highlighting the dying and rising god theme, but he organized it according to lax, speculative nineteenth-century standards.

Frazer’s overall thesis was that archaic magic gave way to religion, which has now given way to science. This theme was soon proven wrong when twentieth-century religion continued to flourish alongside science. He also practiced the risky speculation of armchair scholars, by hypothesizing grand organizing themes without adequate study of the details of each culture (he traveled only to Italy and Greece). This conflict between those exploring large universalist themes and those restricting research to culturally unique specifics has continued and is active in the discussion of the “Dying and Rising Gods,” which was the most controversial schema that Frazer proposed.

Frazer reviewed the ancient texts and recent studies of eastern Mediterranean gods and demi-gods such as Tammuz, Adonis, Dido, Hercules, Melquarth, Attis, Marsyas, Hyacinth, Osiris, Dionysus, Demeter, and Persephone. He interpreted their deaths and resurrections primarily as primitive magic carried over into religions of deities, having the purpose of assuring the fertility of the earth’s reproductive systems. Not understanding the natural processes of growth, he proposed, these ancients believed that they had to magically help fertility happen by imitating the seasonal process, thereby facilitating it. So the death (or descent into the underworld) of a god or goddess was symbolized in part by a ritual of planting

seeds, and the resurrection was an image of plants sprouting and animals being born.

Many variations developed, including bloody sacrifices, such as the initiates into the cult of Cybele imitating her beloved Attis by castrating themselves and throwing their blood (life fluid) and testicles onto a statue of the goddess, apparently to assure her impregnation and subsequent fertility in the plant and animal world. Attis was said to be born of the virgin Nana, and initiates were said to be baptized with the blood of a bull (the *taurobolium*) (Frazer 1922, pp. 403–413). Frazer interpreted this all as promoting fertility among hungry people groping with agricultural practices in a world they saw as filled with spirits. The ancient high death rate may have also been in the background. Women were reported to grieve the death of Adonis, plant gardens of Adonis, and celebrate when the seeds sent up shoots (Frazer 1922, pp. 376–403). He notes an Egyptian inscription that shows the dead Osiris lying prostrate, rising up and standing with Isis (Frazer 1922, p. 436; drawings in Mettinger 2001, pp. 171–174). He also argues that in addition to vegetation magic (naturist), some resurrections were intended to be social, assuring the continuation of the life force of the king (euhemerist), and that some myths (e.g., Osiris) were intended to assure eternal life.

Now all this is fascinating, but Frazer has been accused of excessive speculation, especially in the category of the Dying and Rising Gods as symbols of vegetative growth. Several scholars have rejected his broad universalist category and stressed the particular differences among the accounts of the gods, semi-gods, or humans and textual difficulties, although some scholars support the Dying and Rising Gods theme (Mettinger 2001, p. 215; Fig. 1).

Jonathan Z. Smith

The critical particularist reaction by Jonathan Z. Smith (University of Chicago) in 1987 (2005, 2nd ed.), in Eliade's *Encyclopedia of Religion*, swept aside this Dying and Rising Gods typology as "largely a misnomer based on imaginative

reconstructions and exceeding late or highly ambiguous texts" (Smith 2005, p. 2535). Smith holds the data to strict standards of empirical historical research and finds it lacking. He argues that some of these gods or semi-gods are said to disappear, not die. His typology is that some deities return but have not died and that other gods died but do not return. His thesis is that "There is no unambiguous instance in the history of religions of a dying and rising deity" (Smith 2005, p. 2535).

In one text about the Syrian/Babylonian/Greek god/hero Adonis, for example, in Ovid's *Metamorphoses*, Adonis is killed by a boar, but does not rise from death [except as the anemone flower – Book 10: line 737]. Apollodorus' *Library* (III. xiv. 4) describes Adonis' alternation between the upperworld and the underworld, but, Smith interprets, this offers no explicit suggestion of death and rebirth (Smith 2005, pp. 2535–2536). Smith (like some Christians) suggests that late post-Christian myths of Dying and Rising Gods were likely influenced by Jesus' resurrection. Attis, for example, in a late text, is said to be resurrected, but Smith says he is not here a dying and rising deity, nor is he a deity at all, but a human (Smith 2005, p. 2536). Other myths of resurrection, Smith argues, fail to fit his strict category, such as Baal and Marduk. He says that the text so-called *Death and Resurrection of Bel-Marduk* is most likely an Assyrian political parody (Smith 2005, p. 2537). Osiris, he argues, cannot be said to be risen, "in the sense required by the dying and rising pattern," since his resurrection after dismemberment sent him to be the Lord of the underworld land of the dead, imparting a new permanent life to the deceased (Smith 2005, p. 2538). Thus, he defines resurrection as literally returning to mortal earthly life, excluding continuation as plants or in an immortal state, and rejects the motif of going to the underworld and returning as symbolic of death and resurrection.

Smith is right in pointing out many discontinuities among the supposedly dying and rising gods. The vegetation gods, such as Adonis, differ from the royal kingship gods and the gods of immortality after life, such as Osiris, who combines all three types. Smith's particular readings

Dying and Rising Gods,

Fig. 1 Dying and rising Gods. Osiris rising from his bed in a floating position. His wife Isis standing on the left. (From the Osiris temple at Dendara; see Mettinger (2001, p. 173); Published originally in Mariette, A. (1870). Denderon. Vol. 4. Paris)

are rooted in his empirical hermeneutic and logically astute analyses, inspired by empiricism's distaste for speculation. But Smith's readings are selectively speculative and too literalist for such symbolic literature. This contrasts with a symbolic, more phenomenological hermeneutic, which would read important images differently. For example, the underworld is clearly the ancient abode of the dead, and Adonis is relegated by Zeus to spend half his year there with Persephone (goddess of death) and half above ground with Aphrodite (goddess of love) (Apollodorus III, xiv, 4). This seems clearly to symbolize a dying and rising god able to appear on earth, yet partake in immortal forces that overcome ordinary death (*athanatoi*), thus being able to be resurrected, although perhaps not in a literal earthly body.

Smith focuses on the male dying and rising gods and minimizes the importance of the goddesses. For example, an Inanna text that clearly states that *she* is a dying and rising goddess: "My father. . . He gave me descent into the underworld. He gave me ascent from the underworld" (Wolkstein and Kramer 1983, p. 16). Inanna/Ishtar is clearly the dying and rising goddess (c.f. Persephone) in this Sumerian/Akkadian tradition, and seeking evidence primarily among the male figures distracts from the feminine traditions.

While she descended into the underworld, life above stopped ("Since Ishtar has gone down to the Land of no Return, The bull springs not upon the cow, the ass impregnates no the jenny. . ." lines 6–7), and when she returned, it began again with resurrection ("May the dead rise and smell the incense" last line, Pritchard 1958, pp. 80–85).

Smith seems loathe to accept the idea that return from the underworld is a meaningful symbol of rising from the dead. But in ancient myth, the underworld is commonly the abode of the dead, and rising from it commonly symbolizes return to life on earth or the place of immortality. "Rising" from death need not mean an empirical return to normal bodily life but could easily mean a more poetic, mystical passage of the spirit of the ancestors into the upperworld, which was a common theme in ancient Egyptian and many other religions. Smith focuses on Ishtar's lover Tammuz and, with a reading claiming a mistranslation, says that "in the Akkadian version, Tammuz is dead and remains so" (Smith 2005, p. 2539). Yet the complete reference at the end of the Sumerian and Akkadian texts gives a different picture. When Ishtar returns to the upperworld from the land of the dead, she says:

As for Tammuz, the lover of her youth,
Wash him with pure water, anoint him with sweet
oil;

Clothe him with a red garment, let him *play* on a flute of lapis,
 Let courtesans *turn* [his] mood. . .
 On the day when Tammuz comes up to me,
 When with him the lapis flute (and) the carnelian ring come up to me,
 When with him the wailing men and the wailing women come up to me,
 May the dead rise and smell the incense. (Pritchard 1958, p. 85)

On the surface, Ishtar/Innana's successful battle with Erishkigal, Queen of the Dead, and return to the upperworld with her deceased lover Tammuz/Dumuzi is the symbolic cause of the conquest of death resulting in resurrection. To focus on the death of Tammuz, saying that here he is only being "treated as a corpse," and to highlight the ritual wailing about his loss is to ignore this clear reference to his subsequent return to life, as in the reawakening the erotic instinct of reproduction. ("Let courtesans turn his mood.") Smith simply refuses to read numerous symbols of resurrection as meaningful. To privilege an earlier or later text over another version does not necessarily grant it more authority. Nor does it make sense to claim that Dumuzi/Tammuz cannot return to life, without sending a replacement to the land of the dead, refuting the deity's rising to life for half the year; it simply denies the importance of the "rising" in the life-half of the cycle of the deity's tradition (Smith 2005, p. 3190).

Smith's readings of the Dying and Rising Gods texts is a useful reexamination, but finally a one-sided, narrowly speculative, overly rationalistic hermeneutic, curiously suppressing the symbolic and poetic sensibility basic to religions. "Rising" may be read as a poetic expression of some form of overcoming death, not just the literal return to a human body. The return of a god from the land of the dead to a spiritual realm associated with the resurrection of the human dead need not be discarded as irrelevant in contrast to a demand that the definition of a rising god includes returning to an empirical human body on earth. Smith does this with Osiris, who returns from death to become not a human, but the Lord of immortal souls, with the repeated ritual formula clearly indicating resurrection: "Rise up, you have not died" (Smith 2005, p. 2538).

Tryggve Mettinger

A recent study by the Swedish Hebrew Bible scholar Tryggve Mettinger (University of Lund), *The Riddle of Resurrection: Dying and Rising Gods in the Middle East* (2001), does not accept Smith's conclusions. In a careful textual and linguistic analysis, he accepts more images showing the validity of a variety of dying and rising gods. He does not want to hypostatize a specific type of deity but stresses the different types of gods with similar patterns (Mettinger, p. 218). He concludes, for example, as pictured in the Egyptian Dendara Temple of Osiris inscriptions, that Osiris "both died and rose . . . he rose to continued life in the Netherworld. . ." (Mettinger 2001, p. 175). In response to the idea that some ancient texts may have been read through a Christian lens as implying resurrection, he reminds us that several gods are said to die and return long before the Christian era: Dumuzi, Baal, Melquarth, Adonis, and Osiris.

Christianity

The major question whether early Christians borrowed the theme of the dying and rising god in interpreting their experiences of Jesus is obviously the critical issue. Frazer puts the question in his boldly speculative way:

When we reflect how often the Church has skillfully contrived to plant the seeds of the new faith on the old stock of paganism, we may surmise that the Easter celebration of the dead and risen Christ was grafted upon a similar celebration of the dead and risen Adonis. . . (Frazer 1922: section 217).

Now it is true that Christianity, like many other religions, did borrow many themes from other religions, such as baptism and virgin birth. But many religions commonly borrow themes from earlier faiths. The Hebrew term for "my Lord," *Adonai*, is very similar to the name of the ancient Phoenician/ Syrian/ Greek divinity, Adonis, having the same linguistic root. Mettinger says that dying and rising deities were well known in Israel in New Testament times. Adonis was known in the Hebrew Bible to be "beloved by women" (Bible, Daniel 11:37). The earlier resurrection of

Melquarth-Heracles was celebrated in Tyre (where Jesus visited – Bible, Mark 7:24–30).

But looking at particulars, there are some differences with Jesus. The earlier figures were legendary ancient divinities, whereas Jesus was a living human. For the disciples and Paul, Jesus' resurrection was a one-time historical event, not an annual, mythic ritual tied to fertility or kingship. And Jesus was more an ethical prophet than the ancient vegetation or royalty deities. There is no evidence of the ancient dying and rising gods suffering to forgive sins, as was said of Jesus. There also is no specific evidence that Jesus' resurrection account drew on ancient traditions (Mettinger, p. 221). Do such particulars negate the overlapping cross-cultural themes?

Symbolism and Depth Psychology

Psychologically, resurrection is highly symbolic. It incorporates themes needed by many to deal with the terrors of death, as Carl Jung says, describing the [divine] hero who conquers death and brings back the promise of eternal life. Like Osiris, he/she psychologically becomes the “greater personality in every individual (like the Johannine Christ), viz. His *teleios anthropos*, the complete (or perfect) man, the self” (Jung, *CW* 18: para. 1567). In Jesus' time, the ancient gods had lost their power to the superficial, concretized state religion of Rome that divinized the Caesar for political reasons. A similar situation exists today, Jung says. The authority of traditional religions has been weakened by empirical science and power politics, and there is a need for a spiritual counterbalance to awaken the divine self in each person, a force that takes the soul beyond the vicissitudes of the life-death struggles of time and space. The Dying and Rising Gods theme must be read with depth psychology's poetic eye.

To deny the significance of this theme is to mistakenly restrict religious interpretation to the secular, rationalistic, calculating, logic-chopping hermeneutic. To affirm its poetic, symbolic, psychological significance is to recall the ancient assumption that dynamic infinity transcends

worldly existence and can overcome earthly limits. We could also expand the dying and rising theme to embrace the “one deep river, many new springs” image of old religions as containers of transcendence that contain valuable archetypal themes and successful new “spiritualities” that rise with renewing archetypal themes, now blended globally with new relevance for a new era. We are seeing this with the expanding Western embrace of meditative Buddhism, the feminist and goddess movements, and the newly emerging ecological spirituality.

Earth Goddess, The

Judson Davis

School of Interdisciplinary Studies, Woosong
University, Daejeon, Republic of Korea
University of Freiburg, Freiburg, Germany

Introduction

In humanity's long and varied history, few entities have been revered with such fervent worship and devotion as the Earth Goddess. Also commonly referred to as the Great Mother, this figure would find expression in multiple forms throughout the world's innumerable cultural traditions and historical epics, and would in her most essential representation symbolize the sanctity and provenance of the earth itself. This intimate interrelationship between human cultural manifestation and the natural world is beautifully enunciated in the words of Marija Gimbutas (1989) in her seminal work *The Language of the Goddess*:

The Goddess in all her manifestations was the symbol of the unity of life in Nature. Her power was in water and stone, in tomb and cave, in animals and birds, snakes and fish, hills, tress, and flowers. Hence the holistic and mythopoeic perception of the sacredness and mystery of all there is on earth. (p. 321)

The legacy of the Earth Goddess stretches back many thousands of years and is widely understood to exemplify the evolution of nature worship as

expressed in human artistic representation and religious ritual (Baring and Cashford 1993). Although her origins are thought to date back as far as the period of the Upper Paleolithic (c. 50,000 BCE), it was during the ensuing Neolithic Era between 7000 and 3000 BCE that she came to full prominence. Her many symbolic depictions included the following:

Statues in stone, bone and ivory, tiny figures with long bodies and falling breasts, rounded motherly figures pregnant with birth, figures with signs scratched upon them—lines, triangles, zigzags, circles, nets, leaves, spirals, holes—graceful figures rising out of rock and painted with red ochre—all these have survived through the unrecorded generations of human beings who compose the history of the race. (p. 1)

Such depictions variously portrayed the bringing forth and sustaining of life, as well as its decay and renewal, and included common features of the natural environment such as stones, trees, rivers, mountains, and animals. Further, all such features, as manifestations of the Great Mother, were understood as sacred, and in this sense “the most ancient of religious impulses was that of animism, in which natural phenomena and the land and all within it, animate or inanimate, were seen as being suffused with spiritual qualities, as being ensouled” (Devereux 2000, p. 20). In referring to such characteristics, Eric Neumann (1955/1983) emphasized that:

numinous sites of a preorganic life, which were experienced in *participation mystique* with the

Great Mother, are mountain, cave stone, pillar, and rock—including the childbearing rock—and throne, seat, dwelling place, and incarnation of the Great Mother. . . . It is no accident that ‘stones’ are among the oldest symbols of the Great Mother Goddess, from Cybele and the stone of Pessinus (moved to Rome) to the Islamic Kaaba and the stone of the temple in Jerusalem, not to mention the *omphaloi*, the navel stones, which we find in so many parts of the world. (p. 260)

The Earth Goddess in World Culture

As outlined above, it was through stones and other symbolic representations of the Earth Goddess that this sense of sanctity was expressed, and this process continued unabated over the centuries and later developed into many of the iconic symbols that can still be found today in cultural and religious disciplines throughout the world (Neumann 1955/1983). In European based cultures, for example, the most immediate example of this phenomenon is represented by the Christmas tree, which derives from the immensely old and widespread practice of tree worship:

The numinous-feminine character of the tree speaks to us in the romanticism not only of Greece and the Germanic countries but also of the Old Testament. We know of the veneration of which the tree was held among the Semites—the tree cult on the heights; the worship of the cult pole of Asherah, the goddess of heaven; and the ritual dance around the tree—from the polemics against it in the Old Testament. . . . In this aspect the tree belongs to that stratum of life which is most directly attached to the earth. Older than this stratum is only that of the sacred stones and mountains, which along with water are direct incarnations of the great Earth Mother. (pp. 259–260)

In the Americas, as elsewhere, animals also held great sway as representatives of the Earth Goddess and her sacred covenant with humanity. The inherent strengths and survival instincts of a particular animal species were ascribed to and psychologically absorbed by a given people, and this life-rendering association of an animal species with an individual or tribe exists as a pervasive phenomenon in humanity’s long and diverse cultural history. This totemic affiliation is especially apparent in the primal mythologies of the Western Hemisphere:

North and South American Indian mythology is permeated with animal characters in tales that tell not of the adventures of *a* coyote, *a* raven, or *a* bear, but of the adventures of Coyote, Raven, and Bear. In other words, the individual characters represent entire species or larger classes of animals. This is analogous to the unity of one’s individual guardian animal spirit with the entire genus or species to which it belongs. This unity means that a person usually possesses not just the power of a bear, or of an eagle, but the power of Bear or of Eagle. The possessor of a guardian animal normally draws upon the spiritual power of its entire genus or species, although he is indeed connected into that power by an individualized manifestation of it. (Harner 1980, p. 74)

The Great Mother Goddess in the Evolution of Consciousness

In the tradition of Jungian depth psychology the feminine principle exists as an essential component not only in the process of individual spiritual development but also in the collective evolution of the human species (Jung 1963). Erich Neumann (1954; 1955/1983), one of Jung’s students and most trusted colleagues, produced an extensive study on this subject that outlines the period of the Great Mother as one of the most fundamental stages in human history. It was during this time that human beings are thought to have ascended for the first time to transpersonal levels of consciousness, especially in the form of shamanic trance. This emphasis on heightened spirituality found expression in personified forms that included “figurines representing certain deities, priestesses, and other mythical persona” (Gimbutas and Dexter 1999, p. 4). Central to this experience of ascent into higher celestial domains is the theme of the world axis, or *axis mundi*, and for these ancient cultures “the archetype of the world axis not only produced cosmological models and rituals and was projected onto natural features like trees and mountains, it also gave rise to specific monumental structures” (Devereux 2000, p. 33).

These colossal stone structures first arose in the Middle East, and are architectural representations of the *world mountain* motif, which symbolizes the union of earth and heaven in the form of a temple tower that reaches up into the ethereal realms (Campbell 1964). The expanded heights of spiritual

exploration and experience that arose during this period were correspondingly represented through such structures as the Ziggurats of Mesopotamia, which signified a momentous transformation and extension of the powers of the Earth Goddess. Campbell articulated this critical development as follows:

In the Neolithic village stage of this development and dispersal, the focal figure of all mythology and worship was the bountiful goddess Earth, as the mother and nourisher of life and receiver of the dead for rebirth. In the earliest period of her cult . . . such a mother-goddess may have been thought of only as a local patroness of fertility, as many anthropologists suppose. However, in the temples even of the higher civilizations (Sumer, c. 3500–2350 B.C.), the Great Goddess of highest concern was certainly more than that. She was already, as she is now in the Orient, a metaphysical symbol: the arch personification of the power of Space, Time, and Matter, within whose bounds all beings arise and die: the substance of their bodies, configuration of their lives and thoughts, and receiver of their dead. And everything having form or name—including God personified as good or evil, merciful or wrathful—was her child, within her womb. (p. 7)

In the above framework one observes the transformation of the Great Mother, with her emphasis on fertility, nourishment, and the sacrality of the earth, into the personified and exalted deity of the Great Goddess, with her markedly expanded spiritual powers and cosmological functions. This metamorphosis resulted in the emergence of such iconic figures as Isis, Shakti, Prakriti, and Sophia, which all belong to this widely pervasive archetype of transcendent and spiritually advanced insight (Neumann 1955/1983). And with this evolutionary transformation of the Great Goddess, it thus becomes necessary “to distinguish these two characters of the Feminine, which in their interpenetration, coexistence, and antagonism, are an essential part of the Feminine as a whole. These are the elementary and the transformative characters of the Feminine” (p. 24).

Conclusion

The Great Mother’s evolution in mythic form from fertility figure to icon of spiritual transformation

would transcend numerous incarnations spanning thousands of years, and represented, according to Joseph Campbell, “a prodigious transformation, certainly the most important in the history of the world” (quoted in Wilber 1981/1996, p. 93). In her many beguiling images, and in symbolic structures such as the world mountain, her fundamental qualities found compelling expression in a manner that ultimately confirms a divine union between all of the earth’s creatures and creations—world tree, cosmic mountain, personified divinity, animal deity, and sacred stone. Indeed, so extensive was her proliferation and dispersal throughout world history that no other mythic figure can be said to have held greater sway or reverence. And despite the degradation suffered by the earth in recent centuries and the attendant subjugation of the feminine principle, such mythic images speak to us still, mirroring a place within and pointing to the sacredness of the natural world of which they are divine and eternal reflections. They speak to the very nature of our beings—to the deep and abiding awareness that humanity and the earth are one—and they reveal the earth as a *sacred place* that awaits our redemptive return. In the words of Gimbutas (1989):

The Goddess gradually retreated into the depths of forests or onto mountaintops, where she remains to this day in beliefs and fairy stories. Human alienation from the vital roots of earthly life ensued, the results of which are clear in our contemporary society. But the cycles never stop turning, and now we find the Goddess reemerging from the forests and mountains, bringing us hope for the future, returning us to our most ancient human roots. (p. 321)

East Asian Pastoral Counseling

Siroj Sorajjakool
School of Religion, Loma Linda University,
Loma Linda, CA, USA

East Asia is one of the most populated regions in the world with 1.5 billion people, approximately 133 people per square kilometer or 22% of all the people in the world. It has a history that reaches back thousands of years containing narratives of people surviving trauma after trauma drawing on available resources from rich cultural and religious heritages such as Taoism, Buddhism, Confucianism, and Ancestor Worship. While there are multiple worldviews that guide social relations, most have their roots in Chinese traditions. East Asia has also witnessed a drastic economic growth and permeating force of Western culture and ideology that changes family structure, social patterns, and the way of living. It is within this context that pastoral counseling in East Asia has to negotiate and find its place among the complexity of psychosocial, religious, philosophical, economic, and political world of East Asia.

China

Prior to the People's Revolution in China, Western psychotherapy, particularly psychoanalysis, had already entered the world of the Chinese people through the work of German psychologists. With time, through academic institutions, other therapeutic theories such as cognitive/behavioral, humanistic, and existential psychotherapies became more prominent in China. While these theories were present, the growth of counseling did not start until around 2002–2003. Like many countries in the region, China went through a major transitional period relating to economic growth, stress of unemployment, migration, etc. China realized the enormous negative impact these stressors had on their society, and hence, the government initiated a very basic training program in mental health with different levels of certifications. It was an attempt at mitigating mental health issues. Christians were not immune to this epidemic of social stresses especially in view of the tremendous Christian growth in the country. It was around this period as well that the church began to recognize the importance of addressing the issue of mental health among its members. Because most Christians sought professional help from Christians with clinical skill, the need for professional training in pastoral counseling became immediate. It was around this period that Professor Xuefu Wang, after graduating from Andover-Newton Theological Seminary in the field of pastoral counseling, returned to China and upon an invitation from Professor K. H. Ting, who at the time served as president of Nanjing Theological Seminary, taught pastoral care and counseling and psychology and religion. In 2002 Professor Wang initiated a psychotherapy institute called Zhi Mian Institute of Psychotherapy. This period could be named the official beginning of the profession of pastoral counseling in China. Around this same period Professor Wang became acquainted with Professor Alvin Dueck of Fuller Theological Seminary. Through numerous trips and support from Professor Dueck, many trainings sessions were conducted for the benefits of pastors and seminary professors

including professors in secular universities. These visits of Professor Dueck helped to strengthen the work of Zhi Mian Institute of Psychotherapy.

After years of working with Chinese people dealing with psychological issues, Professor Wang came to the realization that psychotherapy, for it to be effective among Chinese people, needed to be baptized into Chinese culture and as an outcome came the concept of Zhi Mian. The need is to make use of local concepts and resources while maintaining original sources such as existential psychotherapy. Zhi Mian is a dialogue between local resources such as the work of controversial contemporary Chinese philosopher Lu Xun, Chinese medicine, Chinese folk stories, and other philosophers such as Lao Tzu and Chuang Tzu and at the same time the work of Frankl, May, Yalom, Tillich, Bugental, Schneider, Nietzsche, Heidegger, and Kierkegaard. Zhi Mian aims at helping people find authenticity by raising awareness of the self and learning to confront reality. It helps clients to find courage to face life as it comes and generate a sense of meaning for themselves.

Zhi Mian Institute of Psychotherapy has offered training to thousands of Christians and non-Christians in China through a designed curriculum. The curriculum is called the Extended Counseling Program with curriculum addressing topics such as introduction to counseling, developmental psychology, abnormal psychology, techniques for interviews, hotline counseling, group counseling, parenting, social adaptation, indigenous adaptation to Chinese psychological context, and counseling practicum.

Currently there are many Christian counseling centers in China that offer good psychotherapy and provide some form of clinical training. Many of these counselors are trained overseas such as the USA, Hong Kong, or Singapore. Most seminaries offer a course in pastoral counseling, while some designed a curriculum for pastoral counseling. However, there has not been a formalized way to provide clinical training for students. Some pastors seek training from the government's basic training program. There is no formalized training in pastoral counseling in

China at this point although the Chinese Christian Counseling Club is working on forming a network of pastoral counselors. The Zhi Mian Institute of Psychotherapy has also initiated an Association of Chinese Pastoral Counselors as a place of conversation and dissemination of information relating to the field of pastoral counseling.

Hong Kong

Like many countries in the region, Hong Kong experienced rapid growth economically, and this rapid change has altered traditional practices, culture, lifestyle, and ways of living thus increasing pressure for performance and restructuring relationship impacting mental status of the people of Hong Kong. Unlike the development of the discipline in Mainland China, the training in the field of pastoral counseling started much earlier in Hong Kong. In the early 1970s David McCormick, recognizing the growing prevalence of mental health issue in Hong Kong and the need to educate young pastors to be more informed in order to provide better care, started teaching pastoral care and counseling. In 1987 after receiving further training, he started supervision for clinical training in the hospital setting offering CPE to chaplains in training. Since then the field of pastoral counseling has expanded with many trained professionals and academia in the field both from overseas and those receiving training in local universities and seminaries. Professor Simon Shui-man Kwan who is also a member of American Association of Pastoral Counselors, has been teaching pastoral counseling and practical theology at Chung Chi College, Chinese University of Hong Kong from the late 1990s with areas of research on topics dealing with postcolonial theology and hope-based approach to pastoral counseling. There are many seminaries teaching undergraduate and graduate degrees in pastoral counseling such as Bethel seminary, China Graduate School, Hong Kong Baptist Theological Seminary, and Alliance Seminary. There are seminaries that provide both academic and clinical training, while others offer academic program

only. There is no accrediting body in Hong Kong in the field of pastoral counseling that articulates standard of practices and stipulates requirements and hence a variety of requirements in the practice of pastoral counseling with different level of intensity in training both academic and clinical are present. There are many counseling centers with Christian counselors practicing in these centers.

Taiwan

Although the field of counseling is still in its early stage in Taiwan with not much restriction in terms of the requirements for practicing pastoral counseling, the training itself started in the 1970s with a missionary by the name Dr. Ted Cole who taught a course in pastoral counseling in Tainan while he was working in that region. His objective was to offer pastoral counseling skills to pastors. After his return to the USA, nothing much was happening relating to the field of pastoral counseling until Dr. Tai Chun-nan returned from the USA in the 1990s after receiving extensive training in the field. Dr. Tai started teaching at Tainan Theological College and Seminary and soon after initiated a master degree in pastoral counseling under the umbrella of Asia Graduate School of Theology. In 1999 he established the Methodist Graduate School of Theology and served as its chancellor. The Methodist Graduate School of Theology offers master degree as well as a Th.D. in pastoral counseling. Core courses consist of courses such as basic counseling skills, basic counseling psychology, family cycle, developmental psychology, family pathology, research method, psychological assessment, counseling ethics, biblical counseling, premarital counseling, New Testament and Old Testament, juvenal counseling, spiritual formation, crisis counseling, integration between theology and psychology, psychopharmacology, grief counseling, or hospice counseling. In order to gain more recognition for the field of pastoral counseling, the Graduate School sought accreditation with Asia Theological Association. In 2004 Dr. Tai formed the Taiwan Association of Pastoral Counselors that was

recognized by the Department of Internal Affairs. Hence, an accreditation with a recognized accrediting body was essential in moving the field of pastoral counseling forward.

The objectives of the association are to provide certification for those wishing to practice pastoral counseling and to provide training including clinical supervision. A few years later Dr. Eileen Yulin Lin, a licensed orthodontist who received a doctorate (Th.D.) in pastoral counseling from Methodist Graduate School of Theology, became chairperson of Taiwan Association of Pastoral Counselors.

There are three levels of membership: associate member, member, and pastoral counselor. To be a certified pastoral counselor requires a masters or a doctoral degree in pastoral counseling, passing an examination designed by the association, accumulating 150 client hours and pass a case presentation. The process of certification was initiated in 2009. Currently there are 200 members with approximately 20–30 pastoral counselors. Although the association is encouraging certification, not all pastoral counselors in Taiwan are certified. At current, there are approximately 100 pastoral counselors providing care on a part-time basis.

It is not uncommon to find pastoral counselors using theories such as psychoanalysis, cognitive/behavioral, solution-focus brief therapy, gestalt therapy, and existential therapy. There are pastoral counselors who formulate their theories in order to speak more meaningfully to the local context. One such approach is Trinity-Archetypal Counseling (TAC) formulated by Dr. Lin to address the feeling of shame often experience by clients. The theory and practice of this approach is published in the book "Finding True Self in the Bible: Understanding Archetypal Pastoral Guidance: Realizing God's Unique Blueprint." Trinity-Archetypal Counseling affirms clients where they are and helps them see value in themselves even in the midst of mental illness itself. This theory promotes the belief that who they are is a gift from God even if they may be in anxiety or depression. Good and evil are often constructed by the society and it is not how God sees his people. God values them where they are and the way forward is to

recognize and learn to regulate issues they are facing instead of pathologizing them. This is a radical approach within the context of Confucian value system.

In Taiwan, due to the small Christian population, pastoral counselors provide treatment for clients from every religious backgrounds. Pastoral counselors also get referrals from other counseling centers and medical professionals. While there are limited personnel resources because it is a new field, there is a great potential for growth for pastoral counseling in Taiwan.

Korea

According to Y. G. You, the history of pastoral counseling in Korea can be divided into three periods: the Era of Birth: Introduction and Translation Period (1950–1975), Era of Growth: Specialization Period (1980–1999), and the Era of Identity: Competition and Autonomy Period (2000–present).

The Era of Birth. The discipline of pastoral counseling in Korea was initiated during the Korean War. The need for soul care due to deep wounds caused by the war was a fertile soil for the seed of pastoral counseling. It was around this period that Rev. Hwan Shin Lee, who just returned from graduate study in the United States, taught the first pastoral counseling course at Yonsei University. The concept of pastoral counseling was also introduced through translations of some major works in the field into Korean language such as Carroll Wise's *Pastoral Counseling: It's Theory and Practice*, Paul Johnson's *Psychology of Pastoral Care*, Seward Hiltner's *Preface to Pastoral Theology*, and Carl Roger's *Counseling and Psychotherapy*. These books played a formative role in introducing the field of pastoral counseling to the church and the society. In the late 1970s Clinebell's *Basic Types of Pastoral Counseling* helped to raised interest for the field of pastoral counseling in Korea. Two books on pastoral counseling within Korean context were published: *Principles of Pastoral Counseling* by Euyong Hwang (1970) and *Introduction to Pastoral Counseling* by Peter Van

Lierop (1978) who was serving as professor of Yonsei University. Professor Lierop also initiated a counseling center at Yonsei University and offered the first Clinical Pastoral Education program at Severance Hospital of Yonsei University. However, even with translations of major work in pastoral counseling, the field itself did not flourish during this period because the church was more focused on church growth than care of soul, and there was a lack of individuals professionally trained in the field during this period.

The Era of Growth. In 1982, *The Korean Association of Pastoral Counselors* (KAPC) was organized with the primary role of dealing with what it means to be professional pastoral counselors and the development of areas of specialization. To deal with these two issues, the association issues and maintains licenses for practitioners. Obtaining licenses in pastoral/Christian counseling, participants need to pass an exam, a graduate degree in pastoral counseling or related area, and clinical training. The association also hosts monthly clinical seminar and annual academic conference. In 1997, *The Korean Society for Pastoral Care and Counseling* was formed and along with the formation of the society comes biannual academic journal, *Ministry and Counseling*. There are other organizations as well that seek to promote Christian counseling such as *Korean Association of Christian Counseling and Psychotherapy* (1999), *Korean Evangelical Counseling Society* (2000), and *The Korean Association of Clinical Pastoral Education* (2001).

The Era of Identity. This is the era of rapid growth and changes with many Korean scholars returning from the United States with doctorate in the field of pastoral counseling. Many seminaries and religious departments started hiring full-time professors in pastoral counseling and producing many graduates with professional training in the discipline. Many counseling centers were founded and numerous seminaries created their own counseling centers. The rapid growth in the field happened to coincide with changes in Korean society as well. Korean society was experiencing changes as a result of development. Economic changes affect society structure and cultural values where competition has become a new

norm and this norm destabilized traditional family. In relation to economic change, the concept of "self" in Korean society has been altered by industrialization as well. Industrialization has replaced the communal self with individual/autonomous self thus creates further alienation within the community. It is within this context that the care for soul took on a significant role within Korean society.

Many Korean scholars recognized the need to rediscover their Korean roots, and certain Korean concepts were explored in relation to the field of pastoral counseling such as the concept of *Han* as a more relevant concept for pastoral counseling instead of sin while others looked at the concept of *Jeong* or shame. During this period pastoral counseling became the most competitive academic major entering graduate schools in Korea.

While the practice of pastoral counseling in Korea started in the 1970s, the proliferation of counseling centers takes place in the late 1990s and onward. The first Christian counseling center to be established in Korea was Growth Counseling Center established in the 1980s by Dr. Jong Hun Lee. There are approximately 50 counseling centers approved by the Korean Association of Pastoral Counselors. However, there are more counseling centers in operation that have not received approval by the Association. There are three basic types of counseling centers: academic-based centers, independent centers, and church-related centers. Most centers focus their effort on education and training.

Japan

In 1952 Carl Roger did a lecture tour of Japan and out of this visit came increasing interest in school and guidance counseling. W. P. Browning initiated pastoral counseling in Japan, an American missionary in 1953 with courses being taught at Tokyo Union Theological Seminary. The field expanded in the 1950s and the 1960s with Japanese pastors who received training in pastoral counseling returning to Japan. However, the term pastoral counseling only became more

widely used after a visit by Paul E. Johnson who gave instruction to 60 pastors at Kyoto Baptist Hospital in 1964. In 1963 the Japan Institute of Pastoral Counseling was organized and began publishing translations of books by Wayne Oates, Seward Halter, and Howard Clinebell. During this period humanistic psychology and client-centered approaches were popularized. This individualistic focus could perhaps be the result of postwar's struggle to find personal identity. Existentialism and the writings of Kierkegaard, Heidegger, and Sartre were a part of the quest for personal meaning in life. The other reason for the popularization of individualistic approach was the teaching of Zen Buddhism whereby the quest is that moment of enlightenment that transcends space-time history.

In the 1980s, Kwansai Pastoral Counseling Center in Kobe, Growth Counseling Center in Tokyo, and Christian Counseling Center were in operation. In 1984 the Second Asian Conference on Pastoral Care and Counseling was held in Tokyo with Clinebell in attendance. Out of this conference the Pastoral Care and Counseling Association of Japan was organized with the aim of greater inclusiveness. There are seminaries offering graduate degrees in pastoral counseling. While the Christian population in Japan remains small (less than 1%), there are many Japanese Christians who practice counseling and who bring their spiritual knowledge into their interaction with clients without mentioning faith in their conversations.

This expansion of counseling practices is connected to the mental health status of Japanese within this industrialized society. According to a study in 2008 by the Ministry of Health, Welfare and Labor, 24% of Japanese people suffer some form of mental health issue. The report further states that one in five adult Japanese contemplates suicide, while the actual suicide rate is 51 per 100,000 which is twice as high as the US rate. While the government recognizes the seriousness of this issue, the accessibility is still limited. Most Japanese still visit hospitals when experiencing emotional distress for diagnosis and medication. This situation in Japanese society reflects the growing need among Christian and pastoral

counselors to address this increasing needs in ways that is adaptive to Japanese cultural and religious context.

Eastern Orthodox Church

Georgios N. Maragkoudakis
Department of Theology, Faculty of Theology,
Aristotle University of Thessaloniki,
Thessaloniki, Greece

The Eastern Orthodox Church, also termed *Orthodox, Catholic, and Apostolic Church*, is large family of Christian Churches organized in Patriarchates (the ancient ones being those of Constantinople, Alexandria, Antioch, and Jerusalem and the “junior” ones those of Russia, Serbia, Romania, Bulgaria, and Georgia); Autocephalous Churches (mainly those of Greece, Cyprus, Poland, Albania, and the church of Czech and Slovakia); and autonomous Churches (among which are numbered the Churches of Estonia and Finland) or semi-autonomous (for e.g., the Church of Crete) churches. Not all autocephalous and (semi-)autonomous churches are recognized by all Orthodox Churches. For example, the Orthodox Church in America is not autocephaly recognized by Constantinople. The term Orthodox “diaspora” refers to the population of Churches in America, Asia, Australia, Western Europe, and sub-Saharan Africa. Finally, the Patriarch of Constantinople is considered the *primus inter pares* among the other Patriarchs, holding the primacy of honor, and is called the *Ecumenical Patriarch*.

From a historical point of view, what is nowadays known as the Eastern Orthodox Church resulted from the church of the Eastern Roman or Byzantine Empire after the schism between the Latin and the Greek Christendom in 1054,

a by-product of the gradual estrangement of the two churches since the ninth century onward. The councils of Lyon (1274) and of Ferrara-Florence (1438–39) did not succeed in bringing the desired reconciliation and unity of faith among the two churches, which would lead them to unity of communion. In 1965, Pope Paul VI and Patriarch Athenagoras I mutually withdrew the excommunications of 1054, but the road to complete unity is still ahead.

For the church reality, a synod or church council is a convocation of bishops for the purpose of solving and settling issues concerning the doctrine or the practice and life of the Church. There are many types of Synods, with the so-called Ecumenical Council bearing the highest outward authority of all. Until now, seven Ecumenical Councils are generally considered as such; those are the ones held in: (1) Nicaea (325), (2) Constantinople (381), (3) Ephesus (431), (4) Chalcedon (451), (5) Constantinople (553), (6) Constantinople (680–81), and (7) Nicaea (787). Arianism, Macedonians-Pneumatomachi, Nestorianism, Monophysitism, Monophysitism-Origen, Monothelitism, and Iconomachy were the dominant heresies/heretics that were discussed/anathematized in each of the seven Ecumenical Councils. The Nicene–Constantinople creed (i.e., the *Symbol of Faith*; The Creed) was created during the first two councils (Benz 2017).

The theology of the Orthodox Church was expressed not only in Councils, but also in the writings, speeches, and epistles of important writers, usually called church Fathers, like John Damascene (seventh to eighth century) in his work *An Exact Exposition of the Orthodox Faith*, where one can find the whole teachings of the Orthodox Church. The incomprehensible nature of the Holy Trinity, a proof that there is a God, the angels, creation of the cosmos, devil and the demons, man, pleasure, thought and memory, fear and anger, pain, and imagination are some of the many subjects analyzed. Important areas in the Eastern Orthodox worship are the veneration of icons and the prayers to the mother of God and the saints, who have the ability, as believed, to intercede to God for the whole humanity.

Life in the Orthodox Christian Church is organized around certain points in the annual and daily calendar. Every year, Easter, Great Lent, the Holy Week, and the feasts of Ascension and Pentecost are some of the most important periods dedicated for fasting, prayer, and intense church attendance. Furthermore, one can, either at home or at church, practice, on a daily cycle, certain prayers and services, starting from Vespers, at the beginning of the liturgical day, i.e., when the sun goes down, and continuing with Compline, Midnight Office, Matins, and the Hours (First, Third, Sixth, and Ninth). The center of the Orthodox worship is considered the Divine Liturgy (or the Eucharist service), called Holy Mass in the Western rite, where the congregation receives the Holy Communion, one of the seven sacraments/mysteries of the church, with the other ones being Baptism (performed by immersion), Chrismation (Confirmation, administered by the priest immediately after baptism), Repentance (Confession), Marriage, Ordination, and Uncction. During the Divine Liturgy, the bread and wine are considered to become, by the grace of the Holy Spirit, the true and real blood and body of Jesus Christ, through a process called transubstantiation. The church services are principally performed in the native language of the congregation, but in some places (e.g., Greece and Russia) an archaic lingual form is applied (Bulgakov 1988; Clendenin 2003).

The Eastern Orthodox Church participates with other Christian churches to the joint efforts to reach a visible unity of Christians globally. The Ecumenical Patriarchate was the first to take part in the creation and progress of the ecumenical movement. One relative encyclical issued in 1920 is addressed “Unto the Churches of Christ Everywhere” and encourages all Christian churches to take firm actions toward common faith. His All-Holiness Patriarch Bartholomew I also brought together Christians, Muslims, and Jews in the Peace and Tolerance Conference in Istanbul (1994) and has earned the title “Green Patriarch” for his high environmental concerns and the important actions he takes. Under his guidance was organized the *Holy and Great*

Council of the Orthodox Church in 2016, a historical gathering of great importance, in which issues like the *Relations of the Orthodox Church with the Rest of the Christian World* were discussed (Official Documents of the Holy and Great Council of the Orthodox Church 2016).

From a psychological point of view, the Eastern Orthodox Church offers a method of healing for the heart (*Καρδιά*), mind (*Νοῦς*), and soul (*Ψυχή* = psyche, which refers to a spiritual element in unity with the physical body). Many centuries before the modern discoveries about the soul-mind-body unity, the Fathers already knew from personal experience that healing is a holistic process. This healing happens in three stages: (1) catharsis (*Κάθαρσις*), (2) illumination (*Φώτισις*), and (3) theosis/deification (*Θέωσις*). The last phase completes the healing process and brings the mind and heart of man where they used to be before the fall of Adam, in Paradise. So the very essence of the Orthodox path is to carry and transmit this divine energy through the clergy and saints to the others. The practitioner of this mystical path has to transcend the many thoughts of his/her mind, so that the glory of God can come and dwell within. This is the Eastern Christian mysticism and is called *Hesychasm* (*ἡσυχασμός*) (Ware 1995).

In the context of this tradition, the term “mind” refers not to the intellect and reason but to the noetic energy (*νοερά ἐνέργεια*), which functions properly only to those who have completed the first stage, that of catharsis. In this case the noetic energy, the energy of the mind, which is an energy of the soul, functions not only in the brain as reason, analyzing for e.g., mathematics and geometry, but also in the heart as mind, praying unceasingly. There is a very effective practice for all this work and it is called the Jesus Prayer. This prayer consists a central part of the neptic-hesychastic tradition, comprising generally of seven words, *Lord Jesus Christ have mercy on me*, which are repeated over and over by the practitioner, along with bodily postures and respiratory patterns, though the latter two are not necessary techniques and should be used with caution and under proper guidance. The purpose of this prayer is to unite the

mind with the heart, the spiritual heart, not the physical one, so that the Jesus prayer can be repeated, as it is believed, by itself, over and over, helping the practitioner to activate the unceasing prayer of Apostle Paul in the 1 Thessalonians. For this to happen, one must participate in the Sacraments of Confession and Holy Communion, being initiated into the faith through Baptism and Chrismation. Of course, the final purpose of all these methods and techniques are, on a psychological level, to heal every emotional and mental imbalance (Stavros 1998; Rubinart et al. 2016). However, the aim is much deeper than merely psychological, being the ontological transformation of the whole human being in a transcendental level for the purpose of eschatological salvation. One has, of course, to take into account the different meaning of the word soul in modern psychotherapy and in the patristic “psychotherapeutic” tradition (Ware 1989; Zeiders 2013). Three main similarities between the hesychastic-orthodox psychotherapy and the modern psychotherapy have to be stressed: (1) They both generally recognize (to a higher or lesser degree, in one way or another) the psychosomatic unity between the physical and the spiritual parts of man, (2) They both aim at healing every psychological and intellectual dysfunction, and (3) They both – at least in most cases – consider humans as social beings. In fact the orthodox term *κοινωνία* (=communion, cf. *Θεία Κοινωνία* = Holy Communion) describes the ontological connection of a person to God, to other people, to the rest of the world and to one’s own self. Last but not least, the Sacrament of Confession of sins and the catharsis afterward resemble very much, *mutatis mutandis*, the process of psychoanalysis (Johnson 2010).

Eclipses

Jeffrey B. Pettis

Department of Theology, Fordham University,
New York, NY, USA

Pliny the Elder (23–79 CE) in his *Natural History* refers to the eclipse (Greek, *ekleipsis*, “abandonment, failing of power”) of the moon and the sun as “the most marvelous and indeed portentous occurrence in the whole of our observation of nature” (1944, II.VI.46). He notes how the sun and moon “retaliate on one another” as they cross paths, the rays of the sun being taken away by moon and earth (1944, II.VI.47). Pliny says that for a long time people in the ancient world have dreaded an eclipse as a portent of crime or death

and how the dying of the moon meant that “she was poisoned” (1944, II.viii.54). In his *Tetrabiblos*, the Greek astronomer Claudius Ptolemaeus (ca. 100–178 CE) refers to the eclipse as the first and most potent cause of the general conditions of countries or cities (Ptolemy 1940, ii, 75). He interprets the meanings of the colors of eclipses or formations such as light rays (*rabdōn*) and halos. Black colors “signify the effects” (*phanenta sēmantika*) of the cooling, drying influences of Saturn. White colors indicate the temperate powers of Jupiter, and red colors have a hot, burning influence. Color and illumination are predictive of events and earth conditions to occur in particular geographical locations (1940, II, 90), and the position of the eclipse on the horizon tells when and with kind of intensity an event will occur (1940, II, 77). In the Hindu myth of the primordial battle between the Titans and the gods, the eclipse represents Rahu’s inability to drink the elixir. Although he is able to steal a sip of the substance, the cup passes easily through his mouth and out again through his throat. The eclipse is also seen to represent apocalyptic events. In the Gospel of Mark, Jesus predicts that the sun will be darkened (*skotisthēsetai*) and moon will not give its radiance (*pheggos*) as a sign of the time of world tribulation (Mark 13:24; cf. Matt. 24:29–31; Luke 21:25–28; Isa. 13:10; Joel 2:10; 3:4; 4:15). In the Gospel of Luke, the sun “dies out” (*eklipontos*) at the death of Jesus on the cross (Luke 23:45), in this way marking the death of Jesus as someone who is significant and important. In his sermon at Pentecost, Peter speaks of the sun which will be changed into darkness (*metasraphēsetai eis skotos*) and the moon into blood on the day of the Lord (Acts 2:20). The sixteenth-century alchemical text “*Consilium coniugii*” speaks of the changing and thus corruptive nature of the moon and its pernicious relation to the sun. The text refers to the poisonous quality of the moisture of the moon in its eclipse of the sun “when she [moon] receives his light and slays the sun” (Jung 1963, p. 28). At death the two parents [sun and moon] “yield their souls to the son, and die and pass away.” Symbolically this means that the moon as the feminine aspect receives the sun-masculine aspect through which dying and rebirth occur. Penetration into the unconscious world is

both exhaustive and formative, and there is sacrifice involved to yield the New. The new creation – the birth of the son as hermaphrodite – resolves the conflict of the parents. According to the text, the son eats the parents who “are the food of the son” (c.f. the “god-eating of the Aztecs; the parent-eating soul of the Egyptian Pyramid text of Unas) (Jung 1963, p. 30).

Ecology and Christianity

Kirsten S. Oh

Department of Practical Theology, Azusa Pacific University, Azusa, CA, USA

But ask the animals, and they will teach you;
the birds of the air, and they will tell you,
ask the plants of the Earth, and they will teach you;
and the fish of the sea will declare to you.
Who among these does not know
That the hand of the Lord has done this?
In his hand is the life of every living thing
and the breath of every human being. (Job 12: 7–10
NRSV)

Recently, Christianity has reflected deeply on its commitment and engagement with the ecological quandaries and crisis of our modern, technological world. Environmentalists have opened up

awareness of the negative impact Christianity has had on the environment through the interpretation of passages such as “... fill the Earth and subdue it; and have dominion over... every living thing...” as a license to harm the planet (Gen 1:28 NRSV). Christianity has been charged with contributing, actively or passively, to the ecological crisis including pollution, extinction of many plants and animal life, and climate change (Leiss 1994; White 1967). But other traditions in Christianity, such as those of St. Francis, support ecological responsibility (Sorrell 1988).

Richard Bauckham (2010, Preface) defines “ecology” as “The interconnectedness of all things, living and inanimate, on the planet.” With this definition in mind, three movements towards the current relationship between ecology and Christianity will be discussed as follows: (1) historical Christianity, (2) current debates, and (3) psychological interaction with ecology and Christianity.

Historical Christianity

Throughout its history, Christianity had a close engagement with its theology and ecology. The premodern interaction of the Bible and Christian commitment to the care of the Earth can be found in God taking the Sabbath as an image of the profound relationship between God, humanity, and creation. How Christians hold in balance the tension between human dominion over creation and human accountability to God has had far-reaching implications on how believers treat the Earth. The need to temper license with accountability is becoming more paramount in light of the current ecological crisis.

The Bible, read through the lens of ecological responsibility, is replete with God’s desire for redemption of all of God’s creation: “In Christ, God was reconciling the world to himself” (2 Cor. 5:19 NRSV). Christianity has had a long historical tradition of deep reflection dealing with human interaction and responsibility towards nature. For example, in St. Francis’ “Canticles of Creation,” he strongly emphasized the value of all living and nonliving things that make up the Earth’s

environment, including the cyclical nature of seasons as well as all flora and fauna of the Earth. It is no wonder that St. Francis remains the patron saint of Christian environmentalists. St. Francis was not alone in his love for nature. Roger Sorrell writes, “Much of Francis’ outlook in this area [environment and nature] closely reflects earlier ascetic thought and is easily explicable in terms of the common experiences and ideals of the eremitic [hermit’s] life” (Sorrell 1988, p. 138) (Fig. 1).

However, starting in the modern Enlightenment era, Christianity had the unfortunate distinction of being “the most anthropocentric religion the world has ever seen,” due to the negative impact on ecology with the biblical claim of dominion over creation according to Lynn White, Jr.’s famous article “The Historical Roots of Our Ecological Crisis” (1967). White critiqued and attributed the environmental problems, in part, to the Christian notion of “instrumentalist” view that permits the [mis]use of nature based on the understanding that humanity possesses dominion over nature.

The dualistic ideology of the Enlightenment era influenced Christianity’s engagement with the environment, which is evidenced in Ludwig Feuerbach’s statement, “Nature, the world, has no value, no interest for Christians. The Christian

thinks only of himself and the salvation of his soul” (Feuerbach 1957, p. 287). The Neoorthodoxy of Karl Barth, though claiming a dialectical methodology, also perpetuated the either/or dichotomy between God and the world and humanity and nature. This dichotomy is recognized by evangelical biblical scholar Douglas Moo when he concedes, “The New Testament is heavily anthropocentric; the ‘world’ is often viewed negatively; little is said about the nature world; and what little is said sometimes suggests that it is doomed to an imminent fiery end” (Moo 2006, p. 453).

White’s article evoked anger on one side but also conjured enthusiastic production of articles, books, and conferences from numerous Christian thinkers addressing this very issue of ecological and nuclear crisis during the 1960s. Theologians like Alister McGrath redirected White’s accusation towards the “roots [that] lie in the Enlightenment of the eighteenth century and whose foundation belief is that humanity is the arbiter of all ideas and values.” He claimed that Christianity is not by definition antienvironmental; rather, “the critical role of Christianity [is] in emphasizing human accountability for the environment...” (McGrath 2002, p. 54). Reflecting through the biblical texts such as Job 12 (above) more carefully has yielded a plethora of correctives to the previous bifurcation that belittled the environment. Numerous groups have emerged with their own debates as a result of recognition of the environmental degradation.

Current Debates

There are several different foci of effort in saving the environment summarized by John Cobb (1992). There are those who focus on animal suffering like the Humane Society, while ecologists seek equality for all creation and call human hierarchy a sort of “speciesism,” not unlike racism or sexism. Social ecologists who place capitalistic greed as the source of the current crises encourage concrete human changes to turn the crises around (Bookchin 2005). Another group’s focus is on agriculture, soliciting traditions of wisdom and

Ecology and Christianity, Fig. 1 St. Francis. (Retrieved from <http://www.catholic-forum.com/saints/stf01026.jpg>)

practices for sustainable farming (Cobb 1992, pp. 42–48, 63–65). Yet another's focus is on using renewable energy by encouraging customers to use efficient buildings and technology to save both money and the environment (Ecotechnology).

Of these many groups and foci, there are several Christian groups. The most predominant of these groups is The Stewardship Group. This group continues the traditional Christian belief that humanity does indeed have dominion over creation, but the call is to act as good stewards who care for the Earth with understanding and wisdom of the model of God. The focus is on the preservation of the ecosystem for all living things to survive in a healthy planet by realigning the misguided notion of human domination.

The Stewardship Model

The “the default position within ordinary Christian groups” (Attfield 2006) is the stewardship model. In the Christian sense of the word, a steward reports to God because every living thing ultimately belongs to God. In other words:

Stewardship implies caring management, not selfish exploitation; it involves a concern for both present and future as well as self, and a recognition that the world we manage has an interest in its own survival and wellbeing independent of its value to us. . . Good stewardship requires justice, truthfulness, sensitivity, and compassion. (Attfield 2006, pp. 75–76)

According to the Bible, the Earth remains the Lord's (Psalm 24:1) and belongs to God, while all humanity are foreigners and tenants (Leviticus 25:23). Moo suggests, “The hope for the liberation of creation that Paul expresses in Romans 8 (For the creation was subjected to futility, not of its own will but by the will of the one who subjected it, in hope that the creation itself will be set free from its bondage to decay and will obtain the freedom of the glory of the children of God,” (vv. 19–21 NRSV) clearly implies that the destiny of the natural world is not destruction but transformation” (Moo 2006, p. 463). Theologian Douglas Hall takes the stewardship model a step

further by redefining the words “dominion” and “rule” through the Christological lens of love: sacrificial, self-giving (agape) love (Hall 1986, p. 86).

However, Richard Bauckham points to problems with the stewardship model:

Stewardship as hubris – the Earth system itself regulates and automatically controls the global climate and the composition of the atmosphere.

Stewardship excludes God's own activity in the world.

Stewardship lacks specific content – the term “stewardship” can denote the need for human intervention to tame the wildness of nature, while some define it more closely to the preservation of creation.

Stewardship sets humans over creation, not within it.

Stewardship tends to isolate one scriptural text, Genesis 1:26 and 28. Reflecting on the entirety of Scripture allows for a more nuanced look at God's design of all of the creation (Bauckham 2010, pp. 2–12).

Despite these limitations, this model continues to be the primary view from which other views have risen in response to or reaction against it. Christian environmental ethicist Bill McKibben asserts that the “Bible actually mandated protecting the world around us (Noah: the first Green)” and denotes a significant overlap between Christianity and environmentalism, stating the Book of Job as the “first great piece of nature in the Western Tradition” (McKibben 2005). Nevertheless, the correlation between Christianity and environmentalism has been thin. Due to this lack, many Christian thinkers have contributed much discussion to the correlation between Christianity and the Earth. Of these, two major thinkers will be further discussed as follows: Rosemary Radford Ruether and Joseph Sittler.

Rosemary Ruether and Ecofeminism

A feminist theologian, Ruether addresses ecological responsibility and gender suppression with one culprit: domination. Ruether sees the correlation between feminist theology and environmentalism in the double domination of male over female and human over nature. Ecofeminism

asserts that the patriarchal bias of the Christian history has perpetuated a male dominance over both women and creation that subjugated these into a place of oppression. Hence, salvation will come to the entire creation through significant altering of the patriarchal institutions towards a reciprocal interdependent model (Ruether 2000, pp. 90–104). As such, for Ruether the biblical God and Gaia, Greek goddess of Earth, comingle to make Christian ecological theology and ethics possible, calling for a cultural and spiritual revolution towards a post-patriarchal world (Bouma-Prediger 1995, p. 55).

Joseph Sittler

Dubbed a “Pioneering Christian theologian of nature,” Sittler is one of the first Christian thinkers to address the issue of ecology and theology (Bouma-Prediger 1995, p. 14). Sittler broadens the scope of the theological enterprise of his day by including the ecological crisis and cosmic dimensions in a speech to the World Council of Churches in 1961 titled “Called to Unity.” One of Sittler’s most significant concept is the Cosmic Christ: “He [Christ] is the image of the invisible God, the firstborn of all creation; for in him all things in heaven and on Earth were created, things visible and invisible, whether thrones or dominions or rulers or powers – all things have been created through him and for him” (Col. 1:15–20 NRSV) as the biblical basis. By Cosmic Christ, Sittler means “only a Christ whose work is cosmic in scope is large enough to overcome the meaningless and the demonic” and “cosmic redemption entails a cosmic Christ” (Bouma-Prediger 1995, p. 66). In order for this cosmic redemption to be possible, Sittler also expands the doctrine of grace of the Triune (Creator, Redeemer, and Sanctifying) God that is present in the redemption of all God’s creation, rather than just for sin (Sittler 1972).

It is no surprise the historical Christian understanding and the current debates regarding ecology have intersected with the field of pastoral care and counseling. One such example is ecotherapy, the work Howard Clinebell.

Psychological Implications

Understanding the interconnected nature of all creation, Howard Clinebell, who connected religion to psychotherapy and later ecology, recognized the healing of ourselves and healing of the Earth by interacting with the Earth in a more integrated, healthy manner through “ecotherapy.” Under this umbrella term, some therapists use noncoercive “Animal Therapy,” “Horticultural Therapy,” or “Wilderness Therapy” to help people find their authentic selves in the lap of God’s world (Clinebell 1996, pp. 220–230).

cotherapy is a result of three realities that constitute the “ecological circle”: *Inreach*, *Upreach*, and *Outreach*. *Inreach* involves psychological receiving and being nurtured by the healing presence of nature and Earth such as feeling part of the wondrous mysteries of being nurtured by family and food, while *Upreach* involves phenomenological experience of the creative source by locating the self within the greater life of the natural world such as feeling part of the awesome majesty of the sky’s billions of galaxies. Lastly, *Outreach* involves the care for the planet with others such as recycling, conserving resources, and preventing pollution (Clinebell 1996, pp. 8–9).

Within the ecological circle is ecological spirituality, which is a model for both nurturing nature and being nurtured by nature, another subset of ecotherapy. In other words, ecological spirituality is a circle of receiving and experiencing healing from nature, place, and Earth while giving back to the Earth for its healing.

Ecology and Hinduism

Amitabh Vikram Dwivedi

College of Humanities and Social Sciences –
Languages and Literature, Shri Mata Vaishno
Devi University, Katra, India

Introduction

All beings, living as well as nonliving, are parts of God and therefore considered sacred in Hinduism. The followers of this religion treat them with respect and compassion. Hindus do not believe in the idea that senses provide them with direct awareness of objects as proposed in the psychological theory called “naïve realism or perceptual realism.” Instead, they argue that the sense experience is *Maya* “illusion,” and internal realization of the world is rather real. Therefore, plants, rivers, mountains, and streams are not considered simply as natural objects but are realized as sacred in nature. In Hinduism they are featured in many myths, epics, rituals, worship, and daily life. The Hindu philosophy informs us that the soul is immortal, and it moves from one physical form to another, and for that reason, mountains, rivers, animals, and trees are respected and worshipped. The sanctity of life guides the dietary habits of Hindus, and because of that most Hindus are vegetarian. Stories such as how monkey god Hanuman helped Lord Rama, how elephant god Ganesh killed asuras, and how Lord Krishna lived with cows fascinate the Westerners so much so that they are intrigued by Hindu philosophy. Barker's *Ecological Psychology* provides some justification, though implicitly, to why do Hindus behave the way they behave: he argues that human behavior is radically situated; no one can predict human behavior unless he/she knows what situation or context or environment the human in question is in (Heft 2001). Also, in Hinduism, *prakriti* “nature” is considered a creative force, and unlike Freud, Hindu psychologists do not agree with the view that man has a

basic destructive tendency (Akilananda 1948). In Hinduism, the human form of life is considered superior than other living forms; however, Hinduism does not preach domination of other creatures by humans on this earth.

Discussion

The seemingly polytheism in Hinduism is actually monotheistic in nature. Unlike Judeo-Christian religion, followers of Hinduism do not have an authority over nature and creation. Each living being plays an equal role in the process of creation and therefore subject to equal respect and compassion (Akilananda 1948). The Hindu philosophy preaches the doctrine of ahimsa “non-violence,” and Hindu psychologists admit that “there is a great change in physical state when there is a change in mind” (Akilananda 1948). The *Yajnavalkya Smriti*, rather, metaphorically warns “the wicked person who kills animals which are protected has to live in hell fire for the days equal to the number of hair on body of that animal.”

The Rig Veda (X.97) says that plants are “those that grew in old times. . . much earlier than even the shining ones [devas]. . . and are different from many different places. . .” Agni ‘the fire god’ says ‘in plants and herbs. . . I have deposited the germ of increase’” (Rig Veda. X. 183.3). According to the Atharva Veda (VI.136), a medicinal herb is a goddess born on earth. The Rig Veda (X.146) invokes the forest as *Aranyani*, a jungle deity, and further it states that the tree is the “lord of the forest. . . whose praises never fail” (IX.12.7). The Buddhist scriptures inform that sacrifices were performed to *yakshas* or spirits of the trees (Coomaraswamy 1928). Even in the contemporary times, Hindus circumambulate the pipal seven times to the prayer *vriksha rajaya namah* “salutation to the king of trees.” In Hinduism, religious practices, expressions, and ideals are essential to the fulfillment and culmination of consciousness. Therefore, religion supported with ecological practices becomes a way for psychological development and understanding. Many tree-worship seals were recovered from the excavation of the Indus-Saraswati civilization. “On a

steatite seal from Mohanjo Daro, a figure with a horned headdress, long braid, and bangles on both arms stands within a pipal tree” (Krishna and Amirthalangam 2014, p. 6).

The Vedic scriptures of Hinduism offer imagery that describes the power of the ecological world around. Indian Vedantic epistemology and psychology also accept comparison, postulation, and nonperception as the means of new knowledge (Akilananda 1948). The Gayatri Mantra in the Rig Veda extol *bhu* “the earth,” *bhuvah* “the atmosphere,” and *sva* “the sky” as well as the goddess linked with *Prthivi* “the earth,” while meditating on the glory of the creator. The great death-conquering mantra of Lord Shiva, i.e., *triyambakam*, of the Rig Veda (7.59.12) employs the pumpkin metaphor *urvaarukam* (in the accusative case) for deadly and overpowering diseases. While answering to the question: who is Adiyogi Shiva-man, myth or divine? Sadhguru in an interview says Shiva means “that which is not.” When we said “that which is not,” we are talking about a dimension which is not physical in nature. Here Shiva means that principle, that energy, and that consciousness which permeates in the universe, but Hindus also believe that Shiva is Adi Guru and Adi Yogi who lived in Kailash and Kashi. Further, Sadhguru explains Lord Shiva visited earth, but he never bothered to introduce himself; therefore, we call him the first yogi because he never told us his name. Then somebody said “but he’s Shiva because he grasps ‘that which is not’, and because he experiences ‘that which is not,’ we also call him Shiva.” Quite interestingly, Sadhguru argues that we may even name our dog Shiva, and we do not think it is an offense. A dog does not know “that which is not” – a dog is not a yogi. The dog is not going to realize either in its life, but we know it also comes from the same source as I and you came (2018).

Since rivers have been an integral part of Hindu religious practice, many Vedic hymns praise them. The Vedic Bharat is a land of *Sapta Sindhav* “seven rivers,” flowing into the ocean, encompassing from Gyandhara to Kurukshetra. The Ganges River originates from the top of Lord Shiva’s head in the Himalaya Mountains that flows through Northern India. At least 50 Vedic hymns praise the Saraswati River

which is associated with the goodness of knowledge and learning. Other natural elements besides Agni are also considered deities in Hinduism, such as *Usha* “the goddess of dawn;” *Varuna* “the god of waters, oceans, and aquatic animals”; *Indra* “the god of thunderbolt and rain”; and the like.

Ecology and Islam

Abdallah Kahil

Lebanese American University, Beirut, Lebanon

Ecology is a modern field of investigation that came as a result of the industrialization in Europe. The responses to the ecological issues are

therefore modern responses; nevertheless, religious texts may provide further incentives to deal with these issues. Islamic texts that may be consulted to tackle ecological matters are divided into two categories: old and contemporary texts. The original texts consist of the Qur’ān and the saying of the Prophet Muhammad, *Hadīth*, which forms the basis for legal jurisprudence for the Muslims. In addition, there are several Sufi treatises that approach issues of nature and the relationship between human beings and nature. The second category includes the recent work by Islamic scholars who are addressing the issues of ecology by way of rereading the original texts. The question of ecology in Muslim-majority societies is similar to all nonindustrialized societies; the question has been raised because of its weight in industrialized societies; thus, most of the ecological studies and environmental movements are associated with European and North American understanding to the ecological issues.

In Muslim-majority countries, contemporary dealing with issues of ecology is mostly Western influenced, and organizations are related to UN agencies, green movements, and other international organizations or are inspired by international ecological organizations. Studies about ecology and environment are mostly in English language, and their influence on the practical understanding of ecological issues is practically absent. Nevertheless, as these studies and primary sources on ecology indicate, there are plenty of concepts and statements in the Islamic sources to lead to tackling ecological matters effectively.

Several of the issues related to the methodology of discussing religion and ecology were set by Tucker and Grim (Tucker and Grim 2001). These include that religion is as new to deal with ecology as science, with an edge for science in this matter. However, religions, including Islam, “have an important role to play in projecting persuasive visions of a more sustainable future” (Tucker and Grim 2001, p. 4).

The teachings of Islam are spread among the populations of Muslim-majority countries that developed with time, and since God is the provider (*Razīq*), there may be some laziness toward the environment. However, a modern reading to the Qur’ān and Tradition of the Prophet may

reveal a more sympathetic rendering to the teaching of Islam toward ecology.

Contemporary authors about Islam and ecology concur that “1. Nature is sacred; 2. The central role of humankind is as earth’s steward; 3. There is an urgent need for Muslims to modify their behaviors in order to live more harmoniously with the non-human world; 4. The moral and ethical dimensions of the non-human world need to be recognized” (Saniotis 2012, p. 167).

Qur’ān

The defining characteristics of nature that may be deduced from the Qur’ānic discourse include “that natural phenomena have regularity; internal coherence, and elegance, and that they are self-sustaining” and “that nature is an embodiment of God’s mercy or, more fully, that God’s mercy is expressed through the creation of nature. These defining characteristics make a conceptual whole” (Haq 2001, p. 134). Nature is beneficial to the human being (Qur’ān 6:4–16; 55:1–12); furthermore, the elements of the natural world are signs for human being to interpret and understand (Qur’ān 13:3–4; EQ, “Nature as Sign,” EQ). Thus, the relationship between man and nature is both physical and metaphysical. The Qur’ān states as well that nature praises God (Q 24:41), thus equating beings with the rest of creation and suggesting a state of unity, interdependency, and multiplication among the elements of creation.

The world belongs to God, and human beings were assigned several roles within this well-integrated world. On Earth, we were assigned stewardship or agency – the *kahlīfa* of God (Özdemir 2003). “It is He Who hath made you (His) agents, inheritors of the earth: He hath raised you in ranks, some above others: that He may try you in the gifts He hath given you: for thy Lord is quick in punishment: yet He is indeed Oft-forgiving, Most Merciful” (Q 6:165). In spite of this leading role for human beings, God equated all of his creation: “There is not an animal (that lives) on the earth, nor a being that flies on its wings, but (forms part of) communities like you. Nothing have we omitted from the Book, and they

(all) shall be gathered to their Lord in the end” (Q 6:38).

God also urged human beings not to be wasteful: “O Children of Adam! wear your beautiful apparel at every time and place of prayer: eat and drink: But waste not by excess, for Allah loveth not the wasters” (Q 7:31). The Qur’ān reminds the believers that this earth is not for them forever, other generation will come by his will, and consequently they will be the stewards, in the same way they inherited it from earlier generations (Q 6:133).

Hadīth

The sayings of the prophet are more straightforward about the action that human being should take toward nature. They include many statements about an ecological relationship between humans and natural resources. His teachings covered issues like water conservation (even during ablution), planting trees, cultivating barren land, admonishing against cutting trees, and kind treatment of animals. In addition, the Prophet established protected areas for natural life (*hima*), “which may be considered Islamic prototypes for contemporary natural parks and nature conservancies” (Nasr 2003, p. 97).

In one *ḥadīth*, Muhammad’s guide to saving water was clearly stated: “One day, as [The prophet] was passing by Sa’d ibn Abi Waqqas, who was performing ritual ablution, the Prophet scolded him: “What is this waste, o Sa’d?” “Is there waste, even in ablution?” Sa’d asked. And the Prophet answered: “Yes, even when using the running water of a stream” (Ramadan 2010). As for planting trees, the Prophet said in one narration that “there is none amongst the Muslims who plants a tree or sows seeds, and then a bird, or a person or an animal eats from it, but is regarded as a charitable gift for him” (Bukhārī n.d., Vol. 3, Book 39, No. 513). He also encouraged cultivating barren land; narrated by Abu Huraira, The Prophet said, “Whoever has land should cultivate it himself or give it to his (Muslim) brother gratis; otherwise he should keep it uncultivated” (Bukhārī n.d., Vol. 3, Book 39, No. 533).

Sufism

Sufis took the notion of the unity of the world with God to another level. For them all creatures worship God, including nature, as the Qur'an states, and creatures should have close and kind relationships, including humans, animals, plants, and earth, in a cohesion of "biodiversity" and interdependence. Jalal al-Din al-Rumi, a thirteenth-century poet who lived in Anatolia and wrote in Persian, elaborated on this unity by citing many parables and stories. Rumi cites a story about King Solomon who asked several flowers and insects what they do: He saw that a new plant had grown there; then he would say: "Tell your name and use – What medicine are you? What are you? What is your name? To whom are you hateful and to whom are you useful?" Then every plant would tell its effect and name, saying, "I am life to that one, and death to this one. I am poison to this one, and sugar to that one: this is my name inscribed on the Tablet by the Pen of the Divine Decree" (*Masnavi*, 4.1287 ff., cited in Clarke 2003, p. 43).

"This led Solomon to teach the physicians, who then compiled their pharmacopoeia. Nature yields wisdom to those who understand and care to enquire. . . ." Clarke adds: "We are able to speak of Rumi's 'ecology' because his mystical world view is, above all, holistic" (Clarke 2003, p. 43). Said and Funk stress that because spiritual growth requires a sensitivity to the environment, "Sufis therefore look for signs of God in humans and in nature, and contemplate the divine beauty in creation" (Said and Funk 2003, p. 174). Clarke suggests that in the work of Rumi, "nature should be understood as a system and process, with an overall meaning and end in which all parts have their place. The vision desired is, in a word, *ecological*—an ecology that includes not only biology and physics, but also metaphysics" (Clarke 2003, p. 54).

Contemporary Situation

Taking into account that the ecological awareness throughout the world was generated in the

industrialized world, environmental legislation in Muslim-majority societies is borrowed from the West (Llewellyn 2003). The contemporary ecological challenges led several contemporary thinkers from outside the religious establishment to address the question of ecology. They resorted to two major sources of Islamic ethics to find backing to their environmental concerns. In reading the Qur'an and the Hadith, they focused on nature as the creation of God and the idea of unity and the community. Most of these studies, however, are in English. Rarely do we find a text in the indigenous languages from cultures where Islam predominates, such as Persian, Arabic, or Turkish.

Contemporary authors about Islam and ecology concur that "1. Nature is sacred; 2. The central role of humankind is as earth's steward; 3. There is an urgent need for Muslims to modify their behaviors in order to live more harmoniously with the non-human world; 4. The moral and ethical dimensions of the non-human world need to be recognized" (Saniotis 2012, p. 167). Whereas most environmental writers attempt to link the teaching of Islam into the contemporary ecological concerns, Tariq Ramadan goes further and calls for considering deep "issues such as reflection over ways of life and modes of behavior and consumption" (Ramadan 2010).

Psychological Dimension

The modern term for psychology in Arabic is *'ilm al-nafs*, the science or knowledge of the soul/psyche. The word *nafs* has several uses in the Qur'an, with several different meanings: one of them is the soul and another is the self. Three characteristics of *Nafs* in the Qur'an form the basis of much of the later Muslim ethics and psychology; they are:

- (a) It is commanding to evil (*ammara bi 'l su'*) (Q 12, 53); it is associated with desire (*al-hawa'*) (Qur'an 50, 15), it must be restrained (Q 79, 40) and made patient (Qur'an XVIII, 27) and its greed must be feared (Qur'an 59, 9).

- (b) The *nafs* is *lawwama*, i.e., it upbraids (Q 75, 2); the souls (*anfūs*) of deserters are straitened (Q 9, 119).
- (c) The soul is addressed as *mutma'inna*, tranquil (Q 89, 27).

Being a good Muslim requires struggling against the first two characteristics of *Nafs* in order to attain the third one. Taking this as a basis for a psychological approach to ecology brings beings to another concept in the Qur'ān. Several modern writers (Chishti 2003; Clarke 2003; Nasr 1996; Yaqoob 2003) relied on the Quranic notion that Islam is the religion of *Fitra*, "which means the religion that is in the very nature of things and engraved in man's primordial and eternal substance" (Nasr 1996, p. 145). Being aware of the equal status of beings, animals, and nature as they are all the creation of God, and that they all participate in worshiping and praising God, may form a psychological basis for human ecological awareness. In this regard, it is important to cite the context in which the *Nafs* is characterized as tranquil (Q 89, 27):

- (27) "(To the righteous [tranquil] soul will be said:) O (thou) soul, in (complete) rest and satisfaction"
- (28) "Come back thou to thy Lord – well pleased (thyself), and well-pleasing unto Him"
- (29) "Enter thou, then, among My devotees"
- (30) "Yea, enter thou My Heaven."

It is in the context of God addressing the *Nafs* to return to the realm of God, and it should be tranquil after observing the rule of good religious practice; it is a return to its primordial state. These verses are often inscribed on tombstones as an invocation of the desire to have pleased God and satisfied the requirements of being a good believer.

Ecotherapy

Linda Buzzell

Pacifica Graduate Institute, Santa Barbara, CA, USA

As an umbrella term for nature-based methods of physical and psychological healing, ecotherapy represents a new form of psychotherapy that acknowledges the vital role of nature and addresses the human-nature relationship. It takes into account the latest scientific understandings of our universe and the deepest indigenous wisdom. This perspective addresses the critical fact that people are intimately connected with, embedded in, and inseparable from the rest of nature. Grasping this fact shifts our understanding of how to heal the human psyche and the currently dysfunctional, even lethal, human-nature relationship. What happens to nature for good or ill has an impact on people and vice versa, leading to the development

of new methods of individual and community psychotherapeutic diagnosis and treatment (Buzzell and Chalquist 2009, p. 18).

Ecotherapy is sometimes described as applied or clinical ecopsychology. If we define ecopsychology as the study of the human-nature relationship (or the study of the relationship between the human psyche and the rest of nature), then a simple definition of ecotherapy is that it is the field that concerns itself with healing the human-nature relationship.

Sometimes this involves conscious nature contact or nature connection for the purposes of healing people. Animal-assisted therapy, horticultural therapies, nature psychotherapies, wilderness work, outdoor activities, and other restorative modalities are common ecotherapies, backed by impressive scientific research attesting to their healing efficacy. In this sense ecotherapy is evidence-based medicine.

Research on the effectiveness of ecotherapy has tended to focus on specific modalities. Gardening therapy, exercise outdoors, and work with animals, to offer three examples, are consistently associated in study after study with lower blood pressure, diminished anxiety, higher self-esteem, more effective communications skills, development of empathy, and lower intensity of trauma symptoms such as those of post-traumatic stress. Even simple acts like bringing flowers into a hospital room have been shown to speed recovery from surgery. People who have benefitted from these and other ecotherapy modalities include combat veterans, addicts, at-risk juveniles, autistic children, inner city children needing more nature exposure, and institutionalized dementia patients. Also, Richard Louv describes a condition he calls Nature Deficit Disorder that affects both children and adults, prescribing nature contact in various forms as the necessary treatment.

A summary of some of the growing body of evidence for the significant clinical effectiveness of ecotherapy practices is provided in *Ecotherapy: Healing with Nature in Mind* (Buzzell and Chalquist 2009).

But ecotherapy isn't just about humans healing themselves by reconnecting with the rest of

nature. An equally important aspect of ecotherapy is the reciprocal process of humans adopting a more healing stance towards the rest of nature at a time when the rest of nature is in crisis due to human actions. Ecopsychologists like Sarah Conn have pointed out that in the absence of a healthy natural world, human health is impossible (Buzzell and Chalquist 2009, p. 112). So we can't just think of "using" the rest of nature for our own ends without concerning ourselves with the health of the whole of which we are a part. And we also need to take responsibility for our own destructive – even ecocidal – actions. Humans are in the process of destroying not only our own life support systems but also the life support systems of countless other species. In psychotherapy such behavior would be labeled as suicidal, fratricidal, and matricidal – in short, criminally disordered. Ecotherapy seeks ways of treating this collective insanity.

The word "ecotherapy" was coined by pastoral counselor and Civil Rights activist Howard Clinebell (1922–2005), who was born and grew up in Springfield, Illinois. "In the city," as he said, his exposure to the natural world was a constant influence. His parents converted their part of town into a garden (Clinebell's father was an agriculturalist) in which the future ecotherapist worked throughout his childhood. The garden not only strengthened his emotional bond with nature, it fed his family through the Great Depression. Clinebell often visited his grandparents' farm, riding horses and milking cows and swimming in the creek.

Not all of his nature encounters were pleasant. Nearly drowning in a river when his boat capsized taught him that nature could be dangerous when treated without care; only an oar floating back to him saved him from going under. As an adult, seeing the Amazon River for the first time, and putting his soil-familiar hand into dirt destroyed by erosion and exploitation, convinced him that in his sorrow he could hear Earth crying out in pain. As a result of these events, Clinebell could not consider counseling or therapy complete if it ignored the social and environmental dimensions of life. The social dimension had opened for him while marching in Montgomery, Alabama, with

Rev. Martin Luther King Jr. during the Civil Rights Movement.

After earning his PhD from Columbia University and graduating from seminary, he noticed that images of nature appeared to him spontaneously as he provided counseling. This convinced him to include nature in his work with people. He continued to do this after founding various counseling organizations, writing 20 books, and visiting every state in the Union, often pausing to hike and enjoy the scenery. His travels and career eventually brought him to Santa Barbara; from his home he could see the Channel Islands, places sacred to the indigenous Chumash people.

Although Clinebell's own spirituality was an earthy Methodism, he taught his students to allow the people they counseled their own values and beliefs without judgment. Clinebell looked upon spirituality as a basic human striving ultimately rooted in the natural world created by God. He did not expect others to share his belief, preferring instead to quietly observe how interacting consciously with nature so often developed one's capacity for transcendent experience and healthy joy.

Clinebell published *Ecotherapy: Healing Ourselves, Healing the Earth* in 1996. He described ecotherapy as "healing and growth nurtured by healthy interaction with the earth" and gave numerous examples of how to use ecotherapy in a wide variety of counseling situations. However, like Sarah Conn, Clinebell also insisted that genuine ecotherapy always involves reciprocal relations with the natural world rather than exploiting the world, as nature cures tend to do. Recipients of nature's healing presences are encouraged to give something back to the world, thereby acknowledging the relational aspect of ecotherapy while evolving that relationship from one of exploitation or mere sightseeing to one of responsibility and care.

Currently, ecotherapists are increasingly addressing this reciprocal aspect of ecotherapy practice. British ecotherapists Mary-Jayne Rust and Nick Totton (2012), in their anthology *Vital Signs: Psychological Responses to Ecological Crisis*, point out that we must be cognizant of the historical moment at which the fields of

ecopsychology and applied ecopsychology have arisen. We must be “aware of the extraordinary urgency of the external situation which it is one of the missions of ecopsychologists to address. While there would in theory still be an important role for ecopsychology [and ecotherapy] if we were not facing environmental meltdown – exploring the complex relationships between human and other-than-human, and the therapeutic value of bringing the two together – in practice ecopsychology [and ecotherapy] has been completely shaped by a sense of catastrophic loss, of the irreversible destruction of complexity and the impending threat to the systems that sustain life on this planet” (Rust and Totton 2012, p. xvii).

This understanding has led to the development of ecotherapeutic grief work, eco-anxiety treatments, and “waking up” practices by ecotherapists like Mary Gomes, Buddhist ecophilosopher Joanna Macy, Sarah Anne Edwards, and Linda Buzzell. There is also a developing literature on how to deal psychologically and spiritually with impending environmental collapse by writers like former psychotherapist and historian Carolyn Baker, ecophilosopher/ecotherapist Joanna Macy and UK ecopsychician Chris Johnstone, M.D.

Ecstasy

Jo Nash

Sri Lanka International Buddhist Academy,
Kandy, Sri Lanka

Definition

The word ecstasy is derived from the Greek “ekstasis,” meaning “beyond or outside the self,” and has different meanings depending on whether it is used in a religious or psychological context. One definition that can be used to underscore these different ecstasies might be “an experience of blissful non-duality.” This involves an experience of dissolution of ontological boundaries between an internal sense of self and external otherness, leading to an intense affective experience of oneness or union of rapturous intensity called *ecstatic*.

Religious Perspectives

Religious accounts of ecstatic experience are present in the mystical wings of most major world religions, including the Abrahamic, Dharmic, and “indigenous” traditions (also known as shamanic or pagan faiths). Accounts of ecstatic experience are common to charismatic and contemplative Christianity, the Sufis of Islam, the Kabbalists of Judaism, the Vajrayana practitioners of Buddhism, Tantric Hinduism, and the mystics of

Sikhism. Ecstatic experience in a religious context derives from the devotional practices and contemplative disciplines used to dissolve the boundaries between one's sense of an enclosed separate "self" or "I" and the godhead (Yahweh, God, Allah, Brahman, Nam), omnipresent awakened mind (Buddha) or other divine source of being, such as the nature spirits of indigenous and shamanic traditions. Religious ecstasy may be evoked by the affective intensity of the practitioners' devotional fervor, expressed in chants, dance, song, poetry, and other physical practices, such as fasting and ritual, or the cognitive space and stillness of contemplative discipline, comprised of meditation or prayer. In many cases, a mixture of both active devotion and contemplative stillness is used to achieve the dissolution of dualistic perceptions and evoke the non-dual experience of ecstatic bliss. This experience would be deemed desirable by most religious practitioners and indicative of spiritual progress. However, the understanding of ecstasy from a psychological perspective is somewhat different.

Depth Psychology Perspectives

From an object relations psychoanalytic perspective, a loss of boundaries of this kind would imply the dissolution of the ego and a possible regression to a manic defense against separation (Klein 1940), first deployed by the infant in denial of the absent breast, and so a kind of hallucination that defends against unbearable loss of original oneness with the mother's body. Re-experienced in adulthood, an unmediated, boundariless state of bliss could indicate at best a defensive denial of depression and at worst a psychotic mood disorder of the manic or bipolar kind. The one exception to this pathologizing of ecstasy would be the bliss of orgasm experienced during sexual climax with another person and the ensuing sense of inter-subjective merging deemed necessary for a healthy intimate relationship.

From an archetypal psychology perspective, the understanding of ecstatic experience is

different again. Jungian psychologist Robert A. Johnson's (1987) book *Ecstasy: Understanding the Psychology of Joy* proposes that Western civilization has repressed an innate human ability to experience this "oneness," due to guilt and alienation from our bodies at the heart of modern consumerist society, now harbored by the Western collective unconscious. He calls for us to return to the days of Dionysian celebration of the pleasures of the body and the senses and reclaim our birthright to a regular experience of cosmic bliss and ecstasy. This enables human beings to retain vitality, joy, and a sense of being alive that is absent in the lives of so many Western adults. A loss of ritual celebration has occurred with secularization, causing a kind of exhaustion at the heart of a culture that prohibits this need for periodic Dionysian play and wildness, says Johnson. This exhaustion may be partly responsible for the pandemic of depression and anxiety plaguing secularized Western societies.

Neuropsychology Perspectives

However, a neuropsychological analysis of ecstasy uses scientific studies of brain activity to explain the phenomenon of blissful, non-dual experience. Neuropsychologists Newberg and D'Aquili (2000) write:

During certain types of meditation. . . We have proposed that as the hypertrophotropic state creates a state of oceanic bliss, the ergotropic eruption results in the experience of a sense of a tremendous release of energy. . . activity is so extreme that 'spillover' occurs. . . This may be associated with the experience of an orgasmic, rapturous or ecstatic rush, arising from a generalized sense of flow and resulting in a trance-like state. (pp. 255–256)

This "spillover" is comprised of the co-activation of both hemispheres of the brain. Meditative techniques that deploy certain kinds of cognitive strategies alongside focused breathwork enable maximal simultaneous stimulation of the causal and holistic operators that then evoke an existential experience of non-duality, selflessness, or "oneness" with all that is conventionally experienced as "other." The result is ecstasy.

Psycho-Spiritual Explanations

The above accounts have implications for understanding both the psychology and spirituality of ecstasy as an aspect of an experiential ontology of nonself. Far from being a grandiose, elated sensibility associated with the delusory highs and hallucinations of manic psychoses, rather it may indicate that a sense of a boundaried self has been lost or relinquished. This may have both positive and negative results psychologically and spiritually. It may well indicate a regression has taken place but it may also indicate that egocentric object relations have been surrendered, as reported by mystics describing the experience of union with the godhead of monotheisms or merging with the deities or spirits of polytheisms. It may also indicate that the conceptual and ontological boundaries associated with doctrines of the self have been ruptured entirely, as occurs with progressively subtle realizations of “emptiness” or “sunyata” experienced by advanced Buddhist practitioners. Outside the context of religious experience, ecstasy may also be evoked by experience of pure immanence, a kind of blissful integration as depicted in nontheistic poststructural thought of Deleuze (1995/2001).

The key to assessing the function of ecstatic experience must be the observation of the effects. Whether it indicates a psychotic regression or a form of spiritual integration, or just a temporary “peak experience” (Maslow 1964), will be revealed by the longer-term effects on thought, affect, and behavior.

Ecstatic Naturalism

Joseph M. Kramp

John Jay College, New York, NY, USA

History and Origins in the Work of Robert S. Corrington

Ecstatic naturalism is an ideology that views nature as having an unconscious filled with vast amoral potencies. This term, first coined by Robert S. Corrington, assumes that nature is all there is; divinity is manifest only in nature. Ecstatic naturalism is, therefore, also reasonably labeled a theology, though one that is heavily influenced by psychoanalysis and American pragmatism. Though heavily influenced by Emerson, Thoreau, Jung, Kristeva, C. S. Pierce, and other American pragmatists, the first work in the school of ecstatic naturalism was Robert S. Corrington’s *Nature and Spirit: An Essay in Ecstatic Naturalism* (1992). This has been followed by a number of publications further extending the scope of this unique portrayal of nature, perhaps best expressed in his *Ecstatic Naturalism: Signs of The World* (1994) and *Nature’s Religion* (1997). In these later works, Corrington probes into the correlation of psychosemiotics with the psychoanalytic theories of Kohut, Freud, Rank, Jung, Reich, and Kristeva wherein the human unconscious shows itself to be the multiform gateway to the vast underconscious of nature. Theologically,

pantheism is critiqued in these works for its intemperate application of theories of relation and teleology to an unwieldy theory of nature as the “order of orders.” Corrington instead promotes his pantheistic views or as he calls it “deep pantheism.”

Corrington locates the human process within vast natural potencies that shape and groove all that we say, contrive, surmise, conjecture, build, or dream. His (2003a) work, *Riding the Windhorse: On Manic-Depressive Order and the Quest for Wholeness*, applies the categories of ecstatic naturalism to the highly destructive yet creative mode of attunement found in manic-depressive disorder and in many forms of religious leadership. Corrington continues to write prolifically on ecstatic naturalism, which has developed into a school of thought comprised of scholars ranging from all areas of religious studies, including psychology of religion. Corrington is Professor of Theology and Philosophy at Drew University’s Graduate Division of Religion in Madison, NJ.

Definition

An ecstatic naturalism is a perspective that seeks to move toward an esthetic phenomenology of nature’s “sacred folds” – special centers of numinous meaning and power that may be found throughout nature, where “nature” may be understood to mean an encompassing reality that has no other referent. Nature is all that there is: nature is whatever is, in whatever way. From nature’s sacred folds emerges a fierce self-othering, “nature naturing,” or the unconscious of nature, where nature moves ecstatically ejecting semiotically dense phenomena. Nature naturing is the inexhaustible well of nature’s atemporal creating underconscious, “it” is the not-yet-in-time mode of preordinal expression. Nature naturing has a history in the psychology of religion, Jung’s portrayal of Yahweh in *Answer to Job* (1973) being one quintessential example.

This preordinal expression of nature naturing manifests itself as created nature, a plane of immanence composed of innumerable orders, or

nature natured. The plane of nature natured is not without access to its depth dimension however, and the creativity of the depth dimension does not necessarily evidence a telic plan, either. Nature, from the ecstatic naturalist perspective, does not exhibit a theodicy, and whatever the human psychological process is, it is also (in a much deeper sense) rooted in nature’s unconscious. The observer here may be able to see the enormous influence of Jung as well as American pragmatists like C. S. Pierce and John Dewey on this school of thought. Nature naturing is not the unified will or intelligence of a supreme Being, and it is not the sacred – it is just the dense, unspecified and unruly product of nature’s unconscious. Unlike other theological perspectives friendly to the tradition of naturalism (process thought, for example) an ecstatic naturalism denies that nature naturing molds nature natured simply into pleasing shapes. Melancholy, pain, and anguish are just as much to be accounted for in the esthetic phenomenology that an ecstatic naturalism employs. For ecstatic naturalism, naturing is “beyond good and evil” and sustains the just and the unjust, beautiful and the demonic, the fragmented and the harmonious, the honorific and the detestable, the living and the dead (via effects), and the realms of the possible and the actual. The influence here of Paul Tillich and Rollo May should be obvious, as May (1969) refers to the daimonic as “any natural function which has the power to take over the whole person” (p. 121) and that the “daimonic refers to the power of nature. . .and is beyond good and evil” (p. 123). Ecstatic naturalism may, therefore, be viewed as a theological, psychological, and esthetic critique of the propensity of Hellenistic Christianity to promote a dualistic split between the good and evil sides of the daimonic. What ecstatic naturalism observes as a consequence of this split is a loss of the organism’s concept of being as an amalgamation of both good and destructive possibilities (not to mention a repression of the unconscious of nature). Ecstatic naturalism thus has a keen awareness of the tragic dimension of human life, as we are born and abandoned in nature. We have nothing at our disposal for survival

and health but to be inventive against the brutal forces of nature and our awareness of nature's capricious metaphysics.

From the ecstatic naturalist standpoint, as noted, the distinction between nature naturing (the unconscious of nature) and nature natured (the conscious of nature) colors and specifies almost all aspects of, and possibilities for, human life. It indicates, among other things, that the unconscious is far more important, both religiously, psychologically, and philosophically, than has usually been acknowledged. While the conscious represents only one set of aspects of our relation with nature natured, the unconscious is our direct connection both to wider aspects of nature natured and, in certain respects, to the potencies that emerge from nature naturing. The conscious life is much more precarious than traditional monotheisms would allow, but also more magical than traditional naturalisms could recognize. Jung as well as others such as Ralph Waldo Emerson are here again lurking in the background with their relentless critique of the organized religion of their upbringing, yet also highly cognizant of the collective unconscious (or Oversoul) and the importance of the mysteries it represents for psychological, political, and theological life in the here and now.

Ecstatic Naturalism in the Psychology of Religion

Ecstatic naturalism has had an enormous impact on the psychology of religion and, in some ways, has been a dialogue partner with psychologists of religion for a long time. Here are the themes of ecstatic naturalism that have had particular relevance for the psychology of religion.

As Psychological Critique of Theology and the Theological Knowledge Economy

One of the principle criticisms that ecstatic naturalism gets from the philosophical and theological community is its obvious acceptance and use of psychoanalysis (particularly influenced by Jung, but also Kohut and object relations theorists). From the ecstatic naturalist perspective, the

acceptance of psychoanalysis is not some radical intellectual move but is grounded in a metaphysics that has been built upon the work of the likes of Spinoza and Shopenhauer, in addition to a critique of Freud. Ecstatic naturalism also tires of the quaint theological platitudes that are just plain damaging to our common life and that arise out of narcissistic projection, as a sampling from Corrington (1997) suggests: "If Pannenberg wants to talk about god's progressive self-disclosure in the history of religions, ecstatic naturalism prefers to talk about the innumerable shipwrecks of our narcissistic projections, projections aided by the fierce momentum of the interactive field [between nature naturing and nature natured]" (p. 57). Ecstatic naturalism is the theological corrective to this theological denial and also functions to correct a malignant social psychology present in the knowledge economy of most seminary curriculums.

As Esthetic and Ethical Awareness

For Robert S. Corrington, religious sign/symbol systems have a tendency towards tribalism and violence, while the various spheres of the esthetic are comparatively nontribal. Ecstatic naturalism embraces this idea and promotes an esthetic naturalism where the experience of sublime beauty replaces that of religious revelation. For Corrington, the propensity of religious communities to harden their interpretive prospects and semiotic systems comes from a reaction to the fluidity and danger of nature naturing. The problem with this is that it closes off the potentialities of experiencing vital hope and renewal in the community. Hope and art, for Corrington, have their ontological or metaphysical basis in nature naturing. Ecstatic naturalism therefore places a premium on esthetic awareness as the tool for ethical insight and awareness, something that much of the emergent literature in esthetics confirms (e.g., Sartwell 2010). Psychologists of religion have been particularly interested in art and its role in religious expression from Otto Rank to Donald Capps, and Corrington's interpretation syncs with a number of observations of uses of esthetics in religious leadership and ceremonies to induce emotional reactions, compliance, or

violent behavior. Corrington's is, thus, a very important contribution to our literature.

As Contribution to Psychological Biography

The self is of nature and nature is all that there is, according to Corrington and ecstatic naturalism. This places a strong emphasis on knowledge of self and awareness of the role of culture in influencing and forming the self, as well as understanding religious and political leadership. Corrington's (2003a) autobiography and (2003b) psychobiography of Wilhelm Reich are representative, as is Joseph M. Kramp's (2014) psychobiography of Ralph Waldo Emerson. Ecstatic naturalism's insistence on a phenomenology of experience makes it particularly interested in the erotic dimension of human life as an inbreaking of nature's unruly potencies, which has an influence on psychological interpretation. But this is yet another point where ecstatic naturalism provides a critique of the knowledge economy in the university and seminary curriculum, where courses on human sexuality and psychological biography are sometimes hard to find. This focus on embodiment also translates into an emphasis on autonomy in the interpretive field, whether that is interpreting the Bible or any other important text, subject, or geography that the community relies on for its organization (Corrington 1987).

Edinger, Edward

Lee W. Bailey

Department of Philosophy and Religion, Ithaca College, Ithaca, NY, USA

Edward Edinger (1922–1998) was a preeminent classical Jungian analyst in New York City, a very articulate author of many books explaining and elaborating on Carl Jung's analytical psychology. He wrote insightful books on the psychotherapeutic process, such as *Ego and Archetype*, on Jung's work, *The Mystery of the Coniunctio: Alchemical Image of Individuation*, and on Greek mythology and Gnosticism. He applied Jungian archetypal principles to cultural works, such as *Shakespeare*, Goethe's *Faust*, Blake's *Job*, and Melville's *Moby Dick*. He was very interested in Christianity, and explored the Bible, the Prophets, the Psalms, the biblical Apocalypse, and The Christian Archetype.

Jungian Psychoanalysis

Edinger's classic elaboration of the heart of Jungian analytical psychoanalysis is *Ego and Archetype* (Edinger 1972). Here he explores the depths of the relationship between ego and the Self. The Self is the central archetype of wholeness and access to the transcendent that in childhood contains the dormant ego. As the ego develops consciousness, like a child growing up, it moves out of the Self's embrace. There are positive and negative potentials to this development, but when the ego maintains its connection to the

Self, it is most positive, and if it reaches fulfillment in individuation, it serves the Self in a state of wholeness, resolving positives and negatives into the paradoxical and healing conjunction of opposites (Edinger 1972, p. 3ff).

First, the stages of the ego's development risk inflation, mythically portrayed in Adam and Eve's bite into the apple that they thought would make them like God. The expulsion from paradise is the primal ego's birth into the world of conflict, suffering, and uncertainty, forced to deal with instincts such as sexuality. The polarizations of conscious and unconscious, spirit and nature, emerge, challenging the ego to develop awareness and Self-control. From passive obedience, ego grows into greater consciousness, even if it means fighting with parents or God. Myths of encountering or being bitten by a snake express this transition into a new attitude. A snake, symbolizing the instinctive unconscious, stands opposite the more mature ego. The danger is inflation, symbolized by unrealistic grandiose plans or flying myths like Icarus. It may enlarge into excessive *hybris* or pride, and fall, without proper taboos, restraint, or grounding in reality (Edinger 1972, pp. 27–30).

A healthy connection to Self's path to transcendence is essential to a healthy emergence of the ego, even if the youth becomes alienated. But if cut off from Self, the divine within, the ego will become alienated from Self and will suffer. Since children project Gods onto parents, parental rejection, expulsion, abuse, or abandonment ruptures the Ego-self axis and can deeply wound the child's trust and Self-respect (Edinger 1972, p. 39). The opposite, an excessively permissive parent who never says "no" to a child can breed the spoiled child, whose movement from Self is short-circuited, becoming unwilling to accept restraint of ego's desires (Edinger 1972, p. 42). This disconnect with Self may lead the ego to see life as nothing but random chance, dumb luck, or tragic despair, cold meaninglessness, and at worst, raging violence, psychosis, or suicide (Edinger 1972, pp. 43–46). Alienation is necessary to growth, but also reconnecting to Self in a new way is necessary to mental and spiritual health.

Individuation is begun with a return from ego's alienation to Self in a mature way. A mythic image of this theme is Moses, the fugitive rebel from Egypt, who experienced Self as the mystical burning bush, and thus began a new connection to transcendence. A woman's encounter with Self may be symbolized as impregnation with the divine, as with Mary, or ecstasy as in Bernini's statue *The Ecstasy of St. Theresa*.

The individuated life becomes not an ego's effort to dominate and control, but a quest for meaning in suffering and love, paradox, and mystery, due to ego's openness to transcendence. Thus ego becomes a mature individual oriented toward service to the greater Self. A unified mystical field is seen underneath earth's apparent opposites, such as matter/spirit, inner/outer, and male/female (Edinger 1972, p. 96). This field, Jung showed, is symbolized in the circular Mandala that points to the transcendent center as a guide for the ego. Individuation is a process that is never complete, but is a constant life challenge.

Symbols of the goal in dreams, myths, philosophy, and religions, are as varied as metaphysics, the Blood of Christ (Edinger 1972, p. 259), and the Alchemical Philosopher's Stone (Edinger 1972, p. 260ff). In Analytic transference, the client typically projects the transcendent, the parent, or the lover onto the analyst, and the work is to help the client withdraw this projection into himself/herself, reintegrating the conscious ego into wholeness, now on an axis serving not Selfish egotism, but transcendent Self. Expanded consciousness sees into the depths, and death may even become a friend (Elder and Cordic 2009, p. 59).

Jungian Theory

Focusing on Jung's achievements, Edinger sees Jung as a major historical turning point, offering a powerful method for increasing cultural consciousness. In *An American Jungian: In Honor of Edward Edinger*, we have an overview of Edinger's contributions. Like Jung, Edinger worked as an M.D. in psychiatry, so he could see that, in psychotic patients, ego is overcome and

archetypal images are confused with outer reality. Ego may identify with archetypal themes of the prophet, the savior, cosmic dualism, death, and rebirth (Elder and Cordic 2009, pp. 100–106).

Jung also developed an influential theory of psychological types: introvert/extravert, thinking/feeling, and sensation/intuition, each pair needing balancing (Elder and Cordic 2009, pp. 80–83). Jung's major insight was to articulate the psychology of the archetypes of the collective unconscious, and their expressions in myth and dreams, beliefs, behavior, and cultural products like art, ritual, and music. This opening to the deep meaningfulness of both religion and myth are disclosures of the transpersonal collective depths of soul, thus expanding consciousness. Every athletic contest becomes a passionate ritual combat, every film a dramatic myth, and every hero or heroine a numinous archetypal image.

Pathologies are complexes clustered around an archetypal image, thrown off balance by affects that disturb the ego, such as the “daddy’s girl” (Elder and Cordic 2009, p. 84). Major archetypes typically encountered early in analysis include the shadow, a cluster of unconscious negative psychic energies symbolized by flaws, beasts, enemies, horrors, and Satan, that are commonly blindly projected out into the world. Analysis seeks to withdraw these shadow images and find the hidden nugget of gold that it represents: Edinger said: “You know we get the truest appraisal of ourselves by listening to our enemies. My policy is to listen more to my enemies than my friends” (Elder and Cordic 2009, p. 226).

Culture

Edinger also stresses Jung's perception that the sixteenth century was the major turning point in Western history, when the Reformation, the Renaissance, printed books, Columbus' explorations, and the rise of science and expanded commerce, pulled culture away from the faith, toward the modern individual ego, symbolized by the mythic *Faust*, who prefigured the shadow of modernity. He sold his soul to the Devil for unlimited mortal power and pleasure. But modernity's

positive side was to draw away from religion as obedience to authority toward experience of transcendence in one's psyche, the Self. As the shadow of modernity developed, however, it shifted ego into a hostile, materialistic relationship to nature, and the current ecological and economic crises followed, symbolized in Melville's *Moby Dick* (Elder and Cordic 2009, p. 59).

Jung also revolutionized religion by showing its psychological roots. He transformed the God image, Edinger said. Unlike Freud, whose nineteenth century materialistic atheism scorned religion, Jung opened the way to see that the healthy ego needs a proper relationship to authentic transcendence. This led to seeing that this numinous power can be symbolized in many ways, so conventional religions came to be seen as full of mythic, not just literal, but poetic symbols of real transcendent powers. Miracles, such as Jesus' healing the blind, conveyed the mysterious depth of transcendent power, beyond ego's literal [blind] comprehension. To understand religion, the ego must hear poetically, symbolically the subtle mythic language of powers beyond its literalist ken. This shifted the entire hermeneutic of religious studies to a far more symbolic phenomenology, blended with history. Though Jung was primarily monotheistic in his thinking, he really helped undermine monotheism with his openness to the many images of transcendence. This helped open the door for feminists to reawaken the goddess archetypal images and give them a direct gender-friendly image of transcendence. It also helped open doors to the study of world religions, in search of a common global ground for all religious images of transcendence. This was a strong move. Edinger said:

The great service that Jung has performed by his discovery of the collective unconscious, and the archetypes, and the Self, is that he's penetrated to the psychological basis that underlies all the world religions. . . . We've got the basis now for a unification of the factual divisions among the world religions. (Elder and Cordic 2009, pp. 65–66)

Jung saw that psychology is not a religion, but it deals with the source of religions. Religion is not just translating and elaborating on pure revelations from above, but comes through the Self and blends transcendent power with very human

constructs, thus obviating literalist interpretations (Elder and Cordic 2009, p. 69). Like the early Modern Paracelsus, Jung saw that the cosmic energy is not simply above, is it below: “the lower heaven,” and the “stars are in us” (Elder and Cordic 2009, p. 120).

Jung also struggled with the problem of evil, and concluded in *The Answer to Job* that the archetypal God has a shadow, a dark side, and a backside, like all archetypes. We see this now in other divinities, such as the Hindu goddess Kali, source of both life and death. Existence is not made to please humans or believers, nor is God simply a pure cosmic spirit, separate from and high above the world. That mythic image simplifies faith in heavenly goodness overcoming evil in monotheism, but leaves victims struggling with problems such as the Holocaust.

The worldwide myths of Apocalypse, are not literal end of the world messages, but symbolic narratives of the end of historical eras, whether eras of imperial national power or eras of religious claims to unique authority (Elder and Cordic 2009, pp. 226–229). But the ends of eras do happen, hopefully without too much damage. But Edinger fears for the power of modern humanity and its technologies to destroy more than before. He liked Matthew Arnold, whose “Dover Beach” envisions the end of modern religious faith:

The Sea of Faith
Was once, too, at the full, and round earth's shore
Lay like the folds of a bright girdle furled.
But now I only hear
Its melancholy, long, withdrawing roar. . . (Elder and Cordic 2009, p. 258)

Yet Edinger believes that, like the Second Coming, this dismal vision of archetypal apocalyptic forces set loose by modernity will be redeemed by Jung's monumental discovery of the power of the increased consciousness brought by postmodern Jungian psychology. If religions can adapt to this new vision and increase consciousness over literalism and obedience, see through dogmas and mythic religious traditions to the truly powerful numinous transcendence found when the ego aligns with the Self, the spark of God within each soul, there is hope.

Enlightened by Jung's insights, world religions may see the common truth of love for enemies and justice for the poor, at the foundation of all their traditions. Scientific and technological egos may acknowledge their limits, the ecological damage done, and the enchantments in their own technological dreams [such as distant space travel and technological utopia]. Instead each may open their souls to deep transcendence within and without, whispering, with Wordsworth: . . . trailing clouds of glory do we come/From God, who is our home. . . (Elder and Cordic 2009, p. 257). But after Jung, that word “God” will have an entirely different meaning – not a socially constructed angry judge or an authoritarian patriarch, but an ineffable experience of powerful and subtle numinous transcendence through the psyche's Self, that through the Ego-Self axis, guides the ego's struggles to personal and collective harmony.

Ego

Benjamin Beit-Hallahmi

Department of Psychology, University of Haifa,
Haifa, Israel

In classical psychoanalysis, the human personality contains three parts: the id, ego, and superego. The id is defined in terms of the most primitive urges for gratification in the infant, urges dominated by the desire for pleasure. Ruled by no laws of logic, and unconstrained by the resistance of external reality, the id uses what Freud called the primary process, directly expressing somatically generated instincts. Through the inevitable experience of frustration, the infant learns to adapt itself to reality. The resulting secondary process leads to the growth of the ego, which follows what Freud called the reality principle, in contradistinction to the pleasure principle dominating the id. Here the need to delay gratification in the service of self-preservation is slowly learned in an effort to thwart the anxiety produced by unfulfilled desires. What Freud termed defense mechanisms are developed by the ego to deal with such conflicts. These mechanisms are a set of unconscious ego activities aimed at maintaining an internal equilibrium inside the personality. Repression is the most fundamental defense mechanism, but Freud also posited an entire repertoire of others, including reaction formation, isolation, undoing, denial, displacement, and rationalization.

The ego is the central and the executive part of the personality. It is the only part which is in contact with reality, and one of its major tasks is reality testing. Moreover, it has to balance internal demands, coming from the id and the superego, with the demands of the outside world. The ego is the locus for our subjective consciousness and its operations. It thinks, speaks, sees, makes decisions, and controls our body. Through the ego, the personality deals with reality. But there is another level of unconscious processing, which really determines observable behavior on the

part of the person. At the unconscious level, the ego copes with unconscious anxiety coming from within and caused by the id and the superego.

The imagination is a major area of the ego's activity. It creates the person's dreams, as well as art, science, and culture at every level. Religious beliefs are created by the ego's activity, prodded by internal anxiety and outside reality pressures. In psychoanalytic interpretations of religion, various defense mechanisms in the ego have been suggested as contributing to religion and to religious experiences, such as splitting, denial, projection, and repetition compulsion. The ego creates religion and then uses it for its own support and adaptation to reality.

Eleusinian Mysteries

David A. Leeming

University of Connecticut, Storrs, CT, USA
Blanton-Peale Institute, New York, NY, USA

The mystery cult of Eleusis had roots in ancient initiation rituals of the divine child, in the person of the *pais aph' hestias* ("boy of the hearth"). In the myth of Demeter and Persephone, after Persephone is abducted by Hades, her mother, Demeter, allowed the earth to become infertile and barren as she searched everywhere for her lost daughter. In Eleusis she disguised herself as a

nurse maid and cared for the child Demophon, son of the king there. When she attempted to give the child immortality by dipping him into fire, she was discovered and had to reveal herself as Demeter. A temple was built for the goddess at Eleusis and in time the mystery cult evolved there. By sometime in the sixth century BCE, the cult was taken over by the city state of Athens and involved secret initiation rites in an inner sanctum facing which was a magnificent hall. A priestess of Demeter lived in the sanctuary. The rites began with a ritual bath and 3 days of fasting, followed by a procession to Eleusis led by a statue of the god Iacchos, a form of Dionysus. Rituals still essentially unknown then took place in the inner sanctum, rituals that in some sense signified or were meant to ensure fertility, in keeping with Demeter's role as the goddess of fertility. It seems that the initiate spent a night in total darkness and was finally awakened at daybreak by the light of a great fire.

Psychologically, the initiate is the divine child waiting to be released in each of us. Through the process of the Dark Night of the Soul, the journey into unconscious, we can achieve the illumination represented by the light of the fire that awakens the initiate, itself representing the fire into which Demeter dipped the child in the myth. So immersion in fire becomes a baptismal rite of immortality or rebirth, full initiation into the clan of those who have experienced the mysteries.

Eliade, Mircea

Robert S. Ellwood

University of Southern California, Los Angeles, CA, USA

Mircea Eliade (1907–1986) was a Romanian-born historian of religion who did much to shape that discipline and make it an intellectual force in the twentieth century. Eliade graduated from the University of Bucharest in 1928 and then in 1928–1931 studied Indian philosophy at the University of Calcutta and yoga at an ashram in Rishikesh. Returning to Romania, he earned his Ph.D. in 1933 with a dissertation on yoga which, after later revisions and translations, became his *Yoga: Immortality and Freedom* (1958c). Eliade joined the faculty of the University of Bucharest in 1933, where he taught history of religion and Indian philosophy, as well as becoming a widely-read author of fiction and journalistic commentary in the 1930s, something being spoken of as a major voice of the younger generation of Romanians.

In those troubled times for Romania and Europe, toward the end of the decade, Eliade became involved in the rightist politics of the fascist Iron Guard movement; when the King, Carol II, turned against that body in 1938, the young professor was arrested. After his release, well-placed patrons helped him to escape his increasingly desperate homeland in 1940 by securing his appointment as cultural attaché to the Romanian legation in London and, 1941–1945, in Lisbon, Portugal. After the Axis defeat, Eliade, unable to return home because of the communist take-over of his country, became a professor at the Sorbonne in Paris, and then in 1957 at the University of Chicago, where he remained until his death. His prolific postwar work, containing little overt political content, has been largely devoted to understanding the history and meaning of religion.

Basic Ideas

Eliade's basic ideas are concisely expressed in *The Sacred and the Profane* (1959) and *Cosmos and History* (1954; also published as *The Myth of the Eternal Return*). In the former, the fundamental assertion is that, for *homo religiosus*, the traditionally religious person, reality is "nonhomogeneous," split-level, divided into sacred and profane spheres. "Sacred space," the space of the shrine or temple, the pilgrim's goal or the site of a divine "hierophany" or manifestation such as Moses' burning bush or an apparition of Our Lady, has a distinct atmosphere or "feel" different from the ordinary, profane world. "Sacred time," the hours of a festival or religious rite, likewise, is set apart inwardly and outwardly from the profane. Both sacred space and time are likely to be demarcated by symbols. One attuned to it is instinctively aware of the Sacred, likely to speak in a hushed voice and tread with reverent step in its presence.

Sacred space and time, in Eliade's interpretation, are like recapitulations of *illud tempus*, "that time," the primal time recited in the culture's myths of creation and salvation, when divine powers were strong. Temple and rite provide memory of *illud tempus* and a means of access back to it. (For example, the sacred time and space of the Eucharist offers the Christian *homo religiosus* a way once again to be with Jesus and present on the night and day of salvation; cf. also Passover, Chinese and Japanese New Year's, Wesak, etc.) Symbols of the *axis mundi* (pivot of the world), the sacred tree, pillar, or mountain which connects heaven and earth (the cross, the Christmas tree, Mt. Meru) are especially important.

The Sacred can also be "interiorized," found within, and so it is in shamanism, yoga, and authentic mystical and religious experience generally. One finds ways to access inner space and time, even an inner *axis mundi* (e.g., the spinal column in some schools of yoga), through appropriate techniques, and often after appropriate initiations. These are discussed in Eliade's *Yoga* and

in *Shamanism: Archaic Techniques of Ecstasy* (1964), as well as elsewhere. In the latter work, the author presents a discussion, which has proved influential in psychology and literary criticism as well as history of religion, of the shamanic initiate's passage through several stages of call, "initiatory psychopathology," and interiorization of spirit guides before becoming a proficient.

Cosmos and History

In *Cosmos and History*, Eliade proposes that traditional religious history presents two stages: cosmic religion and historical religion. The former, essentially that of archaic hunters and farmers (Paleolithic and Neolithic humanity), though with some continuities down to the present, has little sense of linear, historical time but finds and expresses sacred meaning in aspects of nature – the turn of the seasons, sacred rocks, or trees – and in human life in the social order and the life cycle of birth, maturation, and death. Its festivals are those of New Year's, recapitulating the creation, and annual seedtime and harvest. An "Other World" of gods and spirits stands over against this world here and now; shamans are especially adept at contacting it.

Historical religions, such as Buddhism, Judaism, Christianity, and Islam, differ in that the *illud tempus*, the "strong time" on which the religion is based, was not so much the creation as a moment *within* the stream of linear, historical time: the time of the Buddha's Enlightenment, of the Exodus, of Jesus ("the hopes and fears of all the years/are met in thee tonight"), and of the revelation of the Holy Qur'an. While these faiths retain considerable admixtures of cosmic religion (Passover and Easter as Spring as well as historical-event festivals), the major focus is on religion and salvation as historically conditioned, and this greatly affects the nature of religion.

Eliade did not conceal his own "nostalgia for the sacred" and for the sacred world of cosmic religion, when the Sacred infused nature and the world could be renewed every year. He spoke of

the “terror of history” wrought by the discovery, religious and otherwise, that we humans live in irreversible historical time, not cosmic “eternal return” time. Yet he was well aware that moderns cannot undo modernity; we can at best only complete our own humanity through awareness of that other human possibility which he hoped study of the history of religion could unveil; that was the import of the significant article, “The History of Religions and a New Humanism,” with which he inaugurated the journal he helped found, *History of Religions* (reprinted in *The Quest*, 1969).

Other important works of Eliade’s include *Patterns in Comparative Religion* (1958a), *Myths, Dreams and Mysteries* (1960), *Rites and Symbols of Initiation* (1958b), the three-volume *History of Religious Ideas* (1978–1985), and his editorship of the *Encyclopedia of Religion* (1987). There are also several volumes of fiction and of interviews and autobiography.

Criticism

Eliade has been criticized for the selective use of data to support his models, for being an “essentialist” toward religion and the sacred (i.e., holding it has an objective, unchanging nature) and as an anti-modernist. Some have associated the last with his youthful political views. In response, one could say that he often tried to make clear that his accounts of the sacred are intended to show how the world *appears* to *homo religiosus* as an ideal type, or to put it another way that his model is what is “said” by the phenomena of religion in itself, whether or not most worshipers are an ideal *homo religiosus*; that he believed we need to understand and appreciate the religious past but not to live there; and that the universalism of his history of religions project would appear at odds with the fascist drive to sacralize just one nation and people.

In any case, there is much in Eliade that religious psychology can use: the “non-homogeneous” character of experience of the religious world; the importance of finding inner and outer ways to get in touch with sacred space

and time, whether through places, music, sacraments, or meditation; and the significance of initiatory experience. He has aided many estranged moderns in grasping the inner significance of archaic spirituality.

Elixir

Jeffrey B. Pettis

Department of Theology, Fordham University,
New York, NY, USA

Elixir (Greek, *xērion*, “healing powder”) is a drug or substance which has life-prolonging properties. Throughout history, the elixir has been sought as an antidote to illness and the human desire for *athasias*, “immortality.” There are a variety of texts and symbols having to do with the elixir. In the ancient alchemical text “Isis to Horus,” the prophetess Isis procures what she calls the *pharmakon tēs chēras* (“drug of the widow”) (16). This is the secret revelation which she gives to her son for immortality. The secret revelation consists of the regenerative potency of nature, *physis*: “nature enjoys nature and nature conquers nature” (*hē physis tēn physin terpetai, kai hē physis tēn physin nika*) (7). In ancient mythology, Isis herself is the arcane substance and elixir, glistening with the white of the moon, her crown bounded by serpents, and her cloak “deep black and gleaming” (Apuleius 1989, *The Golden Ass*, XI.3). She is the “dew” and “water of life” (*aqua permanens*) which heals and unites the dismembered parts (Jung 1959/1968, pars. 14). In the ancient Mithras Liturgy found in the Greek Magical Papyri, the supplicant speaks of the juices of herbs and spices and of the mysteries handed down to gain immortality for an only child (PGM IV.477). The sixteenth-century physician and alchemist Paracelsus taught that all substances – mineral, vegetable, animal – contain *quinta-essentia* or “virtue.” Even the smallest amount when extracted can be used for its life-giving, healing properties (Paracelsus 1951, p. 164). The alchemical symbol of the “fish” as the arcane substance becomes understood to be the *lapis philosophorum* – the *elixir vitae* – something going back to early Arabic alchemy. Senior (Zadith ben Hamuel), the tenth-century Islamic alchemist, identifies Christ with the *homo philosophicus*, the Microcosm and One who

does not die and brings life to anything dead (1566, p. 71; Jung 1953/1993, p. 392). The first-century Christian martyr Ignatius of Antioch refers to the Eucharist as the *pharmakon athanasias*, “the medicine of immortality,” something perhaps reaching back to *kipsu* offerings of bread and water in the Mesopotamian cult of the dead. According to Ignatius, the Eucharist is an antidote (*antidotes*) “that allows us not to die, but to live in Jesus Christ at all times” (Eph. 20). Compare also the life-enhancing forbidden fruit (Hebrew, *pry*) in Gen. 3.2. Mandala centers containing figures such as the Buddha Amitabha or Avalokiteshvara are thought to have elixir properties according to the Taoist text, the *Golden Flower* (Jung 1968, p. 98). A certain life force may also be perceived to have generative potency such as the *Yesod* of the ninth *sefirah* of the Kabbalah tree in Jewish mysticism. It is the flowing together of all cosmic energies. Compare the Astral Light in transcendental magic (Levi 2001) and also *chee* as the vital spark of life in Taoism. With all of these texts and symbols, the elixir is understood to result from unconscious processes being made conscious and involving the union of opposites which yields the regenerative New. The elixir as the quintessence of that processing is precious, valued, and guarded. It may be both life-giving and life-taking, healing or poisonous depending upon how it is used.

Emergentism

Joe Cambray
International Association for Analytical
Psychology, Providence, RI, USA

In contradistinction to psychoanalytic theories and methods that are essentially reductive in nature, Jung's approach attends to the whole person. The integration of the personality is the central feature of Jung's view of psychological health and maturation. His notion of individuation involves a life-long dialectic process between conscious and unconscious dimensions of the personality. This goes beyond ego adaptation to reality as the goal of psychological development found in other schools of analysis but requires ongoing examination and even struggle with whatever aspects of one's personality are activated by inner and outer experiences in life. Over the long term, this results in a decentering of the personality with regard to the ego together with the emergence of a new center, the self, which includes transpersonal dimensions. The self is envisioned by Jung to encompass the whole of the personality, conscious and unconscious, personal and collective; it is center and circumference. As such, it does not lead towards perfectionism, but in striving for conscious expression, it necessarily remains unfinished; the approach is towards completeness, with its positive and negative features. It is the achievement of a lifetime. The vision here is radically holistic. What are the roots of this vision?

Mythic and Historic Background

Prior to the advent of modern science, holistic perspectives were an integral part of cultural life. As a part of the prescientific worldview, the entire world was seen as animated and often so portrayed in mythologies. Within traditional cultures, tales of emergence are commonly featured in creation myths. Original ancestors are typically envisioned as emerging from earth or water, or the world itself emerges from the waters of chaos. Stories of this sort are found throughout history and across cultures. Examples are plentiful, as from ancient Egyptian and Assyrian sources, in tales from Melanesia and the indigenous peoples of the Americas, as well as the better known Norse, Greco-Roman, and Judeo-Christian variants. Mythically emergence displays a transcultural or archetypal pattern, symbolic of birth or rebirth. This mythic stratum forms a deep background for subsequent elaborations of emergence on a more conceptual level.

During the seventeenth century, with the rise of the scientific paradigm, a new precision was brought to the concept of "emergence." The term began to appear in scientific language as when Newton described experiments in optics, e.g., referring to the refraction of light through a prism he notes "the incident refractions were. . .equal to the emergent" (Newton 1676, p. 555). Perhaps most interesting of the new conceptual use of terms related to emergence was that by G. W. Leibniz (the co-discoverer of calculus along with Newton). Leibniz was the first person to employ the term "supervenience" consistent with emergentist views in a way similar to its modern use by philosophers of mind (Kim 1993). For Leibniz, this indicated a synchronous, non-Cartesian relationship between bodies and minds, consistent with an emergentist perspective, as has recently been discussed (Cambray 2005). This view of the mind-body relationship, of a preestablished harmony, was the one Jung identified as the primary precursor for his idea of synchronicity.

Leibniz's insights into supervenience were so far ahead of his times that they languished in obscurity for almost 250 years before being

revived by the emergentist movement of the late nineteenth and early twentieth centuries. Philosophically descriptive emergentism was seeking to reestablish a view of science based on holistic principles. One of the most significant figures in this movement for the development of Jungian thought was Conway Lloyd Morgan. His 1896 book *Habit and Instinct*, with its entomological examples such as the leaf-cutting ant and the yucca moth, was a major source for Jung's formulation of archetypal theory (Hogenson 2001). Morgan's 1922 Gifford lectures on *Emergent Evolution* included recognition of Leibniz's foundational role in this paradigm.

Due to the speculative, philosophical nature of this paradigm at the time (it lacked a more solid experimental base), it could not compete against the empirical data from the growing field of biochemistry and especially the finding arising from the advent of molecular biology in understanding biological systems. With the triumphal articulation of the structure of the molecular base of genetics, in the form of the biopolymer DNA, revealed by crystallography in 1953, a more reductive, strictly deterministic philosophy came to dominate many of the biological sciences. There was a countermovement in general systems theory and cybernetics also developing during this era, but applications were limited. Jung himself was interested in cybernetic principles and saw the human psyche as a self-regulating system.

Complex Systems

The study of systems has been greatly aided by the availability of high-speed computers. Remarkable breakthroughs in modeling systems that could not be analyzed by conventional, reductive means due to their complexity began to draw attention starting with the study of "chaos theory." This was first popularly applied to the investigation of weather patterns. More general exploration of systems made up of numbers of parts capable of interacting with one another showed that certain kinds of interactive systems could produce aggregate properties and behaviors which were not discernable or predictable from the known

attributes of the parts. These high-order, non-reducible traits are explored in the new science of "complexity." Complex systems are nonlinear, small variations, as in initial conditions can generate large changes (the well-known butterfly effect).

A particularly important subset of these systems are those that open to the environment, under selection pressure, capable of dissipating energy and generating increased internal order – they have significant adaptive capacity and are referred to as complex adaptive systems marked by self-organizing properties. The higher-order phenomena associated with the self-organizing features of these systems are termed emergent. There are a number of traits generally associated with emergence: novelty, irreducibility, nonlinearity, unpredictability, and synergy; some researchers also include coherence and historicity.

Emergence in Analytical Psychology

Emergent phenomena have become a distinct area of study for systems scientists. They have been shown to most likely occur at the edge of order and chaos and are seen as the site for coming into being of life, the psyche and the mind, remarkably consistent with and affirming of the mythopoetic stories referred to earlier. Emergence has been found throughout nature and the human world: from the organization within clusters of subatomic particle all the way to the clustering of galaxies; in biological systems such as the behavior of social insects, the organization of and interactions within the body and brain from which mind emerges; to networks of human interactions producing economic and cultural behaviors. Emergence spans, transgresses, and links the many disciplines studied by humans. In recent years, the study complex systems and emergence have been effectively used to reconsider a variety of Jung's ideas: archetypes, complexes, the self, synchronicity, as well as his analytic methods (see Cambray and Carter 2004 together with the references therein). Other schools of psychology have also begun to adopt systemic thinking to their approaches. Within the psychoanalytic community, the intersubjective

and relational schools have been most active in developing applying these ideas to their analytic models. Dyads, such as mother-infant pairings as well as analytic couples, have been examined and discussed for their self-organizing and emergent properties.

Although during his lifetime Jung only had studies on self-regulation to draw upon (complexity theory had not yet been developed), he was able to intuit various principles of self-organization and emergence. In applying these ideas to psychological problems and their transcendence, he comments:

I had learned that all the greatest and most important problems of life are fundamentally insoluble. They must be so, for they express the necessary polarity inherent in every *self-regulating system*. They can never be solved, but only outgrown. I therefore asked myself whether this outgrowing, this possibility of further psychic development, was not the normal thing, and whether getting stuck in a conflict was pathological. Everyone must possess that *higher level*, at least in embryonic form, and must under favorable circumstances be able to develop this potentiality (Jung 1967, para. 18, my ital).

Similarly Jung's theory of compensation with the importance that it stresses on the emergence of a "third" position as a transcendent reality that allows overcoming difficulty without attempting direct solution of problems can be seen as based on an emergentist perspective. This view also allows a reformulation of psychopathology in terms of fears of or resistance to emergence. For Jung then human suffering as well as its transcendence is embedded in a profoundly systemic worldview.

Because Jung's model of the self has an interactive, transpersonal dimension to it, the emergentist aspect of this has been noted. Similarly there is an inherent holism in Jung's self: "As an empirical concept, the self designates the whole range of psychic phenomena in man. It expresses the unity of the personality as a whole" (Jung 1971, para. 789). The spiritual features of Jung's archetypal model of the self have often been discussed; here it serves as part of the linkage between psychology and religion that has entered some of the emergentist literature. Thus, philosopher Philip Clayton's discussion

of levels of emergence beyond mental causation associated with mind, derived from biological systems, seeks to make such bridges. In this, collective intelligences of various sorts are drawn upon to point towards phenomena of the spirit (Clayton 2004, Chap. 5: "Emergence and Transcendence"). The growing interest in emergentism in many fields of human endeavor will perhaps allow a deeper appreciation of Jung's psychological genius and a fuller reconsideration of his model of the psyche. In recent years, there have been a growing number of publications reframing Jung's views on archetypes in terms of emergent properties of the psyche providing a bridge to potential engagement with other psychological researchers using an emergentist paradigm.

Emotional Intelligence

Ryan LaMothe

Pastoral Care and Counseling, St. Meinrad School of Theology, St. Meinrad, IN, USA

Emotional intelligence is a relatively recent term that has significant implications for understanding religious experience and faith. Before defining emotional intelligence and explaining its relevance to religious faith, it is important to first set the stage by offering a brief definition of the term emotion and an overview of how it has been understood and used in philosophical and theological thought, as well as in the human sciences.

Defining Emotions

There is considerable debate among researchers, psychologists, and philosophers about what emotions are and how they differ from feelings, sentiments, and moods (see Frijda 2000). “Some researchers,” report Parrot and Spackman, “conceive of emotion in an undifferentiated manner, investigating the effects of overall arousal, excitement, agitation, or drive without any distinguishing among different types of emotional states. Others treat emotional states as varying along two or more continuous dimensions, such as arousal and valence. The third and most common approach to emotional states treats them as discrete categories” (Parrot and Spackman 2000, p. 476). For our purposes, emotion comprises (1) complex mental processes that are innate or pre-organized, which may not be conscious or experienced as distinct feelings, and (2) discrete categories of feeling states such as anger, sadness, fear, and hate. Moods are different from feelings in that they are global and not necessarily directed toward an object or result from a particular object or event (Jacobson 1957, pp. 73–113).

Overview of Emotions in Philosophy and Science

The notion of emotion vis-à-vis reason, will, and religious faith has varied in meaning and significance in Western philosophy and theology (Solomon 2000, pp. 3–15). Aristotle, in his *Rhetoric*, recognized that emotions are necessary for rational appraisal and the good life (see Sorabji 2000, pp. 23–26). Rational appraisal for Aristotle includes a person’s ability to assess accurately a social context and to act with the appropriate amount of emotion. After Aristotle, the Stoics offered a slightly different perspective on emotions. Sorabji noted that the Stoics identified four emotions, namely, distress, pleasure, fear, and appetite (Sorabji 2000). They claimed that every “emotion involves two distinct value judgments. One that there is a good or bad (benefit or harm) at hand, the other that it is appropriate to act” (Sorabji 2000, p. 29). Posidonius, a later Stoic philosopher, criticized the intellectualism of other Stoics, arguing, “that the examination of things good and evil, the examination of goals, and the examination of virtues depend on a correct examination of emotions” (Sorabji 2000, p. 95). Posidonius also said that there are occasions when we experience emotions that are not connected to value judgments (e.g., being moved by music), suggesting that there are irrational or unconscious processes at work; in modern-day parlance, there are emotional experiences that are tenuously connected to the prefrontal cortex. Emotions, for the Stoics, also involve imagination and attention. That is, we can increase the intensity of emotion by way of our imagination.

Solomon argued that, as the Hellenistic philosophers gave way to Christian theologians, several significant changes occurred regarding how theologians conceptualized the relation between reason and emotion. In general, emotion was split between those that led to vices and those that led to virtues. Desire and passion were seen as distorting the will and reason, which gained expression in the seven deadly sins. The good emotions were love, hope, and faith and these

were “often equated with reason” (Solomon 2000, p. 6). Emotions linked to the passions and desires were suspect, needing to be eradicated or controlled through spiritual disciplines. The elevation of reason and suspicion of intense emotions were yoked to how theologians conceptualized gender and power. Men were viewed as having greater capacities for reason and women and children with less, making them more susceptible to emotions (passions).

Some modern philosophers have been critical of Cartesian and Christian philosophical traditions that elevate, if not glorify, reason and ignore or minimize emotions in reason and faith (Fiumara 2001; Furtak 2005). John Macmurray, who seemed to take one of his cues from Spinoza’s view that rationality and irrationality are qualities of emotions, was one of the first modern Western philosophers to argue forcefully that reason plays a role in emotional life and that reason is contingent upon emotion. “Any inquiry,” he wrote, “must have a motive or it could not be carried on at all, and all motives belong to our emotional life” (Macmurray 1992, p. 3). Macmurray believed that we “can only begin to grow up into rationality when we begin to see our emotional life not as the center of things but as part of the development of humanity” (1992, p. 14). For Macmurray, a dynamic interdependence exists between reason and emotion. Thus, we must cultivate both.

While ancient and modern philosophers debated questions about the significance of emotions vis-à-vis knowledge and religious faith, scientists were interested in studying (1) emotions in humans and animals, (2) emotional expressions and meanings across cultures, and (3) emotion vis-à-vis the brain. In the nineteenth century, Charles Darwin studied emotions in human beings and animals (Darwin 1972). In the United States, philosopher-psychologist William James rooted emotions in human physiology, arguing that emotion is caused by physiological sensations (James 1884). He later explored the relation between emotions and religious experience (James 1958). His Viennese counterpart, Sigmund

Freud, developed a complex theory of the mind and its relation to anxiety, a central emotion in human life (Roose and Glick 1995). More recently, there has been an explosion of research regarding emotions and intelligence in relation to psychosocial development, psychopathology, and neuroanatomy (Ekman 2003; Shore 2003). This research demonstrates the (1) existence of a feedback loop between physical expressions of emotions and a person’s conscious experience of emotion, (2) centrality of emotions in perceptions and the organization of experience (the interconnection between the limbic system and the prefrontal cortex), and (3) importance of parent’s recognition and appropriate responses vis-à-vis their child’s emotional assertions in his/her developing the capacities for emotional self-regulation, empathy, and social confidence.

Emotional Intelligence

This research has increased interest in moving away from measuring intelligence solely in terms of cognition. The ideas of interpersonal and emotional intelligence have been proposed, not to replace the intelligence quotient but rather to deepen and expand our understanding of the complexity of intelligence in human life. Gardner argued that intelligence comprises interpersonal and intrapersonal intelligence:

Interpersonal intelligence is the ability to understand other people: what motivates them, how they work, how to work cooperatively with them. Successful salespeople, politicians, teachers, clinicians, and religious leaders are likely to be individuals with high degrees of interpersonal intelligence. Intrapersonal intelligence . . . is a correlative ability, turned inward. It is a capacity to form an accurate, veridical model of oneself and to use that model to operate effectively in life (Goleman 1997, p. 39).

Both interpersonal and intrapersonal intelligences, Gardner claimed, include the abilities to recognize, differentiate between, and appropriately respond to the desires, aims, emotions, and moods of other people. This requires a person’s ability to notice and respond appropriately to

social-emotional cues, all of which may take place outside of awareness. Similarly, emotional intelligence, which has various definitions and emphases, refers to an array of cognitive-emotional capacities whereby a person is able to recognize, monitor, and regulate his/her own feelings, as well as the feelings of others. This is accomplished through awareness and appraisal of one's own and others' tone of voice, facial expressions, body posture, and gestures, as well as an individual's and group's ability to think about or reflect on their emotions (see Taylor et al. 1999, pp. 339–354).

Daniel Goleman has done much to popularize the term emotional intelligence. Citing and summarizing Salovey and Mayer's, he identified five capabilities related to emotional intelligence, namely, (1) knowing one's emotions, (2) managing one's emotions, (3) recognizing emotions in others, (4) motivating oneself, and (5) handling relationships (Goleman 1997, p. 43). In a later work, Goleman narrates the discussions between scientists and Tibetan religious leaders about destructive and constructive emotions (Goleman 2004). In these conversations, scientists identify research that points to the effectiveness of religious meditation practices in increasing the capacities of emotional intelligence.

Emotional Intelligence: Implications for Religion and Faith

Since Goleman's book, there has been a rise in the literature on emotional intelligence, ranging from scholarly articles to popular self-help books for parents, teachers, leaders, and business people. Some of this has spilled over into the area of religious faith, though the implications of the idea of emotional intelligence for understanding religious faith development are still being realized, in part, because researchers and clinicians continue to rely on cognitive and psychodynamic theories and models of development (see Lyon 2004, pp. 269–284). These psychological perspectives tend to relegate emotions to the background, suggesting that the primary focus of faith development is the regulation of emotions. Instead of relegating emotions to an adjunct

position, we might wonder how the notion of emotional intelligence alters views on faith, faith development, and religious experience. How, in other words, does the idea of emotional intelligence inform our understanding of religious faith and experience? Does faith depend on cultivating emotions? If emotional intelligence is necessary for individual and social health, do religious practices and beliefs contribute in any way to the development of emotional intelligence? By contrast, what religious practices and beliefs obstruct emotional intelligence?

While there is growing interest in addressing these questions more directly (Emmons 2000, pp. 3–26; Reich 2003, pp. 1–32), Goleman and others note that religious practices and beliefs can contribute to the development of emotional intelligence. Goleman points to research that shows how Tibetan religious beliefs in loving kindness, gentleness, and compassion – coupled with the practice of meditation – contribute to emotional intelligence. Similarly, Christian beliefs such as loving one's neighbors, showing compassion for others, as well as religious practices that aim to embody these principles can lead to the development of emotional intelligence and a living faith. One may conclude that (1) the development of emotional intelligence is necessary for the development of a religious faith that embodies compassion, empathy, and loving kindness and (2) particular religious practices and beliefs can lead to the development of emotional intelligence. This said, faith researchers also recognize that human beings can be deliberately cruel and destructive. Traditionally, theological concepts such as idolatry, sin, and evil have been used to account for human destructiveness. The idea of emotional intelligence can be used to reinterpret theological concepts (e.g., sin and idolatry) and expand our understanding of maladies of faith or religious experience.

Research on emotions and the development of emotional intelligence adds to our understanding of human life. This offers theologians, researchers on religious experience and faith development, and ministers of all faiths opportunities to reconceptualize and expand upon their theological anthropologies, their theories on faith development, and their practices of care.

Emotionally Focused Couples Therapy

Patrick W. Prag
Cottonwood Counseling Center Lafayette,
Colorado, Denver, CO, USA

History/Background

Emotionally Focused Couples Therapy (EFT) created by Dr. Susan Johnson and Dr. Leslie Greenberg is a systematic, empirically validated model of therapeutic intervention – based on attachment theory – that helps couples move away from ridged and negative interaction patterns and move toward caring, trusting, and emotionally bonding experiences.

EFT explores the negative and ridged defensive patterns of couples that fuel projections. These projections exhibit as blame, anger, attack, false acquiescence, and withdrawal. Projections in the defensive/escalated stance lead to ego-dystonic emotions such as loneliness, abandonment, inadequacy, and feeling unworthy or unloved. Relationship stress and a lack of a secure emotional bond activate these emotions. EFT is based on John Bowlby and Mary Ainsworth's attachment theory. Bowlby is credited with developing the theory and Ainsworth for validating and expanding it by remarkable research such as her seminal Strange Situation Experiment which in turn was the foundation of the secure base theory (Bowlby 1988).

Bowlby's foundational and perhaps seminal work was Attachment published in 1969. What was unique about Bowlby's theory and work was his call for his ideas to be tested through a multidisciplinary fashion using the intersections of social interaction and instinctual/ behavioral infant and child development. These fields had a common focal point through the primal language of emotional experiencing (Bowlby 1969). Multiple discrete studies in the field such as Ainsworth (1963, 1967), Shaffer and Emerson (1964), Newson and Newson (1966, 1968), Ainsworth, Salter, and Wittig (1969), and Reingold

(1969) confirmed attachment strivings in infancy and attachment mediating behavior in children (Bowlby 1969). Bowlby (1969, 1982), Stern (1985), Izard (1982), and Emde (1983) furthered the idea of a developing organized, intrinsic human system, which mediated attachment through intimate emotional bonding (Bowlby 1988).

Today Bowlby's theories as well as new territory in the adult attachment field continue to be validated by the work of many therapists and researchers (Mikulincer and Shaver 2007). However in EFT, the practice of using attachment theory specifically to help couples reduce damaging negative interaction cycles and reach their maximum potential as satisfied romantic partners and individuals shows great promise through empirically validated data.

EFT is situated within the broader field of attachment theory precisely in that it leverages the human intuitive appraisal system. It is the intuitive appraisal of affect, feelings, and emotions that is the primary feedback system to one's own organismic states, and informs the power to act effectively in the ever-changing physical and social environment (Bowlby 1969).

EFT Within Marriage and Family Therapy

EFT is widely recognized as a systematic, empirically validated model of relational intervention. It has reached the highest standard of psychotherapy research as set by the APA and other governing bodies of the field. To date, EFT's meta-analysis (Johnson et al. 1999), conducted before the year 2000, achieved the largest effect size (1.3) of any other couple intervention. Follow-up studies show rigorous results. Process research strongly supports that the change process in couples mirrors what the model purports (<http://www.iceeft.com/images/PDFs/EFTResearch.pdf>. Retrieved August 10, 2017).

EFT Training

EFT certification is a rigorous program offered to those who hold a postgraduate degree in a relevant

discipline/mental health field such as Social Work, Psychology, Education, Counseling, Marital and Family Therapy, and Pastoral Care. The certification process is a series of structured didactic and experiential modules that can take several years to complete. A 4-day Externship followed by a series of five-weekend Core Skills Trainings coupled with ongoing group and individual supervision is required. Once the therapist has completed Core Skills, they may begin to work toward submission of two live-session videotapes that model the required process, skills, interventions, and affect attunement. An extensive application, videotapes with a written summary noting what interventions were used, their rational, and alternative options are presented for approval for the designation of Certified EFT therapist. A Certified EFT Supervisor and Trainer are also possible post-certification achievements.

Clinical Application: How EFT Works

EFT is a psychodynamic humanistic experiential model that consists of three phases and a nine-step progression within those phases. Each step has very specific interventions that the therapist uses to bring awareness and transformation to a couple's ridged and harmful interaction patterns. Each complete phase of EFT has particular outcomes and markers the therapist facilitates. Examples of these for each member of the dyad are:

- An explicit felt sense of safety in the room with the therapist.
- Each member of the dyad exhibits a growing stated awareness of their defensive, emotionally escalated interactive patterns.
- A marked de-escalation of the couples' defensive/escalated interactive cycles as evidenced by the ability for each person to attempt to reach verbally with vulnerable affect to their partner with the fears that fuel their defensive/escalated stance.
- The partner is able to stay attuned, responsive, and engaged with such reaches.
- Lastly, both partners have an awareness of and can state deep attachment longings, for example, a sense of being enough in their partners

eyes, the longing for love and acceptance, the need to be desired and sought after, and the need to know they are lovable, to name a few.

The EFT model postulates that a couple would not need relationship therapy if they were able to reach to one another with soft vulnerable non-defensive affect, conveying availability and emotional responsiveness. This type of open and less defended experiencing is termed by Fosha (2000) – an attachment theorist and developer of the Accelerated Experiential Dynamic Psychotherapy model – as *green signal* affects. These signals from one's partner are described as promoting hope, vitality, trust, safety, and confidence in oneself. This type of intersubjective experiencing is a marked pivotal moment in EFT therapy that contrasts the intractable ego-dystonic experiences of multiple failed attempts of connection. Rather than receiving the defensive projection from their partner that activates the fight, flight or freeze states of the sympathetic nervous system, exploration, and new experiencing prevail (Fosha 2000, p. 115).

The EFT therapist monitors the activation system of both partners simultaneously. Through their presence in the room, tone of voice, pacing, mirroring client emotions, and their own calm, nonjudgmental affect, the therapist seeks to track, reflect back, and validate the emotional reality and interpersonal responses of each partner's experience (Johnson 2007). This validation and being seen brings safety to both partners and simultaneously frames the couple's experience in the EFT attachment frame. Progressively a secure base is established: a primal need in facing the world and relationships *securely* rather than *anxious-preoccupied*, *dismissive-avoidant*, or *fearful-avoidant*. Defensively blocked, protected, and unacknowledged emotions are seen through the EFT attachment lens as what lies underneath couples' negative cycles. Each dyad is seen as longing to have these feelings acknowledged, validated, accepted, and engaged by their partner.

Once the EFT therapist brings these emotions to light and the stances that partners use to protect these feeling, partners can begin to own their stance which in turn opens more safety in the relationship. Consequently the EFT therapist

begins, in small doses, to have each partner share these live-in-the-moment felt states through structured enactments. This emotional arousal opens the door for restructuring embedded memories of felt states via new positive experiences. The therapist understands that underneath the old negative affect-laden experiences are sublimated attachment longings, desires, and needs, coming forth sometimes for the first time in their relationship. Monitoring the surfacing of old and present wounds, the therapist utilizes a specific healing structure to reengage from withdrawn stances and soften from critical or blaming patterns (Johnson et al. 2005).

Religious and Theological Implications

Religious and theological understanding may help illuminate attachment striving as indicated below. EFT, based on attachment theory, in turn may inform religious and theological understanding.

Gordon D. Kaufman, an American theologian and Mallinckrodt professor of Divinity (Emeritus) at Harvard Divinity School, in his work *The Theological Imagination: Constructing the Concept of God* (1981), invites the reader to an understanding of John Bowlby's attachment theory. Kaufman makes a case for understanding God as the only true and reliable object to attach one's self to. Further, attachment to humans will not and cannot free humans from their anxiety of unfulfilled attachment longings because human relations are finite, are limited, break trust, and do not possess the security of a prescient and omniscient Divine. Kaufman argues for a limited form of attachment that restricts loyalty to God precisely in service of protection from further fragmenting the sense of self despite deep connection with friends or family.

EFT may inform this type of theology. Not all internal images of the Divine are secure and accessible. In fact many people have been traumatized by religious systems that require loyalty and fail to meet the unspoken emotional needs of their followers, or worse, they are emotionally manipulative and abusive. Graham (1997) argues that understanding God is inseparable with understanding human beings. Positive emotional regard

from caring others may be the only route to an intersubjective experience of the *Imago Dei*. As one begins to heal those fragmented and disowned parts of self through Emotionally Focused Therapy, one's faith in a divine, benevolent, God may move from the intellectual to the experiential. Most Abrahamic faith traditions rely on an earthly father/mother symbolism and patriarchal narratives to provide knowledge of what God may be. This idea of human experience in a lived life-informing theology is consistent with the post-modern pastoral theological view (Miller-McLemore 2012).

One of the strongest points of attraction between EFT and the Abrahamic traditions is that of the creation narratives: God created humans because he/she wanted relationship. Christ's relationship with his followers is symbolized as intimate as a husband and a bride. Reciprocal love between God and his followers is a theme throughout the Old and New Testament, Torah, and the Koran. Building on this intersection, Susan Johnson has recently published an EFT-based book for Christian couples (Johnson 2016).

Buddhist practice also has intersections with EFT. Unlike the traditional Abrahamic theology of humans in need of atonement for their sin, Buddhists espouse the basic goodness of the human being (Trungpa 2009). This is not unlike the working theory in EFT that finds over and over again in clinical practice and research that couples tend to respond in compassion, care, and non-judgment when a safe secure bond is forming (or being restored) as evidenced by more secure relational attachment styles (Burgess Moser et al. 2015). Previously hidden and protected vulnerable emotions that are shared in a nondefensive manner reciprocally evoke human goodness.

Another intersection of the Buddhist practice and the EFT model is that of being fully present. Unless one is disciplined in their practice of right living and meditation, one cannot learn to shed the false realities that lead one to engage in the three poisons of greed, ill will, and delusion. This shedding is only possible with rigorous mindfulness that opens the door to a way of living that rebirths a wise practice of living, social awareness, and deep compassion (Loy 2015).

The EFT model seeks to empower clients to shed false assumptions and fears about their partner typically fueled by defensive and projective patterns. EFT brings embedded negative experiences to the present moment and awakens within clients the ability to own their fears. It does this by unrelenting, live in the moment, unpacking of the current moment emotional experience of the couple. Concomitant with the Buddhist tradition, this is accomplished by non-judgment.

In this light EFT's methodology and theory has significant implications for theological construction and religious praxis.

Agnosticism/Atheism

EFT situates itself atop attachment theory's evolutionary foundation. Darwin (1859), attachment theory, and EFT all agree on the primal and necessary minute-to-minute intuitive appraisal of affect, emotion, and feelings that insure survival and reproduction. EFT and the science of modern romantic relationships continues to qualitatively and quantitatively understand this highly developed adaptive mechanism. This should appeal to atheistic and agnostic leanings alike.

Critics of EFT

Among the criticisms of EFT is the proposition that activated emotion is not the only and sufficient means of restructuring intractable patterns of behavior based on past experienced memories. Lane et al. (2015) propose a model that theorizes several therapeutic entry points into an integrated memory structure; EFT is only one of them, and Behavioral Therapy, Cognitive Behavioral Therapy, and Psychodynamic Psychotherapy are the others. Ecker, Hulley, and Ticic purport that emotion is not necessary for restructuring memory or in the brains rewriting experience that erases old negative patterns. Reactivation of a schema without what the authors term *concurrent discrepancy* will fail to change old memory and thus negative patterns.

Empathy and Christianity

Dan O'Brien

Department of History, Philosophy and Culture,
Oxford Brookes University, Oxford, UK

In the philosophy of mind and philosophy of psychology, empathy is primarily seen as the mechanism through which we come to share in and understand the thoughts and emotions of others. This is contrasted with sympathy, which has connotations of caring and compassion. (For discussion of a wider range of empathetic phenomena, see the entry on ► [“Empathy Expanded”](#) in this volume.) There is low-level empathy where the emotions of another are contagious. One can, for example, be deflated by the sadness of those around you, or as Hume puts it in a letter to Adam Smith, a depressed person can throw a “Damp on Company” (Hume 1932, 1.169, 313). There is also high-level empathy. This is where the perspective of another is adopted, where I might be said to get into their shoes. I may, for example, come to understand why you find a certain social situation awkward. This is not because I have

merely caught your unease, via low-level empathy, but because I come to appreciate how it is for you to be here with these people given what you know about them and your previous encounters with them. Empathy involves “the sense of being emotionally and cognitively “in tune with” another person, particularly by feeling what their situation is like from the inside or what it is like for them” (Blackburn 2016, 152). Both kinds of empathy play a role in religion, and this entry considers their role in Christianity. There are, for example, good reasons to think that God must be able to empathize with us.

Our knowledge of each other is of course limited, but, being omniscient, God’s knowledge is not. His knowledge is “as complete as it is possible for a state of knowledge to be” (Morris 1991, 84): “before him no creature is hidden, but all are open and laid bare to the eyes of him with whom we have to do” (Hebrews 4: 13); “The Lord knoweth the thoughts of men” (Psalm 93:11). He is a God “unto whom all hearts are open, all desires known, and from whom no secrets are hid” (as voiced in Anglican communion). Omniscience thus entails knowing what another is thinking and philosophers of mind talk of this in terms of “mindreading.” I shall refer to God’s ability to do this as “divine mindreading.”

O’Brien (2013) argues that divine mindreading must involve empathy. In interpreting thinkers, we must empathize with them: understanding someone’s words, thoughts, and actions involves being able to think the thoughts that they entertained when they said, thought, or performed them. An omniscient God understands all our thoughts, and in order to do so he must be capable of empathizing with us. Zagzebski argues that since “God is cognitively perfect, he must grasp what it is like to be his creatures and to have each and every one of their experiences” (2016, 438). Such knowledge requires “total empathy”: the ability to “empathiz[e] with every one of a person’s conscious states throughout that person’s entire life – every thought, belief, sensation, mood, desire, and choice, as well as every emotion” (ibid., 442). God can only be seen as omniscient if he has omniscience, that is, “the property of consciously grasping with perfect

accuracy and completeness every conscious state of every creature from that creature's own perspective" (ibid., 435).

Stump (2010) relates empathy to the notion of personal presence – when, that is, one is present *with* another person or present *to* them. Empathy with another can cause us to feel, in some sense, another's pain, and when this occurs another's presence is vivid. Presence is also a feature of our cognitive interaction with one another: as we communicate with each other, either verbally or perhaps by catching someone's eye, we are present to each other. If you are reading this essay in the presence of another person, that person is *here*, *now*, *with you*. At the beginning of a lecture, I may look out at a sea of faces, but when I catch someone's eye, or listen to their question, I come to see one of those faces as a person. I am not merely aware of my own first-person experiences, nor am I merely aware of that person's objective, physical properties, those that can be apprehended from the third person perspective; I am, rather, aware of their consciousness in the world – they become present to me as another person. In coming to see them in this way, I adopt the second person perspective.

Such presence is magnified where there is love: "there is a much greater degree of personal presence when two people, who are mutually close to one another in a loving relationship, are mutually mind-reading each other in intense shared attention" (Stump 2013, 41). God too, Stump argues, can be present to us and we to him, both in divine mindreading and through divine love. Zagzebski proposes that "God's love for each of us is generated from a preceding act of total, unmediated intellectual comprehension of us" (2016, 449); "If omnibusjectivity is total perfect empathy, it is the most intimate acquaintance possible compatible with a separation of selves" (Zagzebski 2016, 443). There is, then, unilateral apprehension of another, when, for example, one empathizes with their pain and in so doing their presence is manifest; mutual awareness manifests in communication and in love; and, Stump argues, there is a deeper form of presence involving God, that characterized by the theological notion of indwelling, where the Holy Spirit dwells in the believer's

mind. This is a maximal form of empathy and second person presence: "In the Holy Spirit's indwelling, God himself is somehow within each person of faith" (Stump 2013, 47).

A distinct form of empathetic engagement with another involves joint attention (Eilan et al. 2005). A badminton player is aware of the flight of the shuttlecock and she is aware that her opponent is also tracking this object in the same way as her. They jointly attend to the shuttlecock, and in sports arenas many people are jointly aware of the action – watching the game *together*. Such joint attention plays an important role in child development, from early parent-child relations involving pointing and gaze-following, through more sophisticated awareness of attention in social relations, ultimately to the ability to mindread (Reddy 2011; Moll and Meltzoff 2011). Pinsent argues that the phenomenon of joint attention illuminates Aquinas' understanding of virtue. Piety involves not just worship of God, but also other people – the "children" of God – and in acting piously one "participates in God's stance" (2012, 54) towards them; one joins God in attending to them. Courage involves confidence in overcoming problems in life, a confidence in one's actions that God also shares.

There are, however, various philosophical problems associated with divine empathy. First, there is tension with the traditional view that God is impassible, that is, that he cannot experience suffering or feel emotions. This is the orthodox Catholic view. It has been argued that the transient character of our emotional life is incompatible with the unchanging nature of God, a claim for which there is scriptural support (see, for example, Numbers 23:19 and 1 Samuel 15:29). There is a long philosophical tradition in which emotions are seen as clouding rationality and thus as being incompatible with divine wisdom. Emotional feelings also require a physical body, which God does not have (see Scrutton 2013).

Second, divine empathy can also be seen as incompatible with other divine attributes, that is, it would appear to be impossible for God to have certain kinds of empathetic abilities given the other divine attributes we typically take him to possess. We have "indexical" knowledge

concerning particular times and places – I believe it is *now* rather cold and that it looks rather pleasant *over there* – yet it is not clear that God, not being located at a particular point in space and time, could have such knowledge (Grim 1985). There are also several related arguments to the conclusion that God’s divine attributes limit his possession or understanding of certain concepts. God cannot understand the concepts of surprise, tiredness, lust, fear, or despair because he cannot be surprised (since he is omniscient), tired, fearful, or despairing (because he is omnipotent) or lustful (because he is without sin). (See Nagasawa 2008, part II, for details of these incompatibility arguments.)

Stump (2013) suggests a solution may be found to such problems in the Chalcedonian conception of the Incarnation. Christ is one person, yet he possesses two minds: one human, one divine. God can empathize with humans and thus be able to come to understand them in virtue of Christ possessing a human mind, one that can feel emotion, have indexical knowledge and knowledge that depends on the possession of a physical body.

Artists have attempted to represent such empathetic relations between God and man. Religious art can elicit low-level empathy on the part of the viewer: in their masterly portrayals of the broken body of Christ counter-reformation artists had a wide repertoire of techniques to promote such empathy. It is hard not to be moved by the way Christ’s pale hand entwines with that of an angel in Veronese’s “Pieta” (1581; Hermitage, St. Petersburg) and how Michelangelo sculpts Mary’s slumped body and Christ’s fingers resting on her dress in his pieta of 1499 (St. Peters, Rome). The sharp corners of masonry in Antonello da Messina’s “Pieta with Three Angels” (1475; Museo Correr, Venice) almost dig into our own flesh and in Jose de Ribera’s, “The Trinity” (1635; Prado, Madrid), one’s skin stretches with that of Christ as he rests on God’s lap, at the point of slipping from it. Artists also play with rhythm and constrained movement. In a fourteenth-century painting of the crucifixion by

Ugolino da Siena, “Crucifixion with the Madonna, Saint John and Angels” (Museo Thyssen-Bornemisza, Madrid), one feels one’s own torso twisting in rhythm to the opposed stances of Christ, Mary, and John. The art critic Berenson notes of Renaissance nudes that “taughtnesses of muscle and those stretchings and relaxings and ripples of skin which, translated into similar strains on our own persons, make us fully realise movement” (1896, pp. 86–7). As one approaches Caravaggio’s “Flagellation” (1607) down a long gallery in the Museo di Capodimonte in Naples, one starts to tense with the tussling bodies, the knots in their muscles emphasized by the twisted loincloth, clothes, rope binding a switch, and crown of thorns. Christ teeters, his body twisted in opposite directions, his knees buckle as the torturers pull his hair and kick his calf.

Artists have also attempted to represent high-level empathy and understanding. In Francisco Ribalta’s “The Vision of St. Bernard” (1625; Prado, Madrid), Christ appears to Bernard while praying in Church, detaching himself from the cross in order to embrace him. In this painting we see Bernard’s empathy with the suffering of Christ, and his love, but we also see Christ’s reciprocal empathy and love for Bernard. Christ is not only aware of Bernard’s love towards him, but also his pious beliefs, hopes, and intentions concerning his life. Their joint-presence together, in Stump’s sense, is beautifully expressed. In Tintoretto’s “Christ Mocked” (1549; private collection; see Puglisi, C. and W. Barcham, 2011, p. 127) and Caravaggio’s “The Taking of Christ” (1602; National Gallery of Ireland, Dublin), we see Christ looking out at the viewer and, in the latter, at Judas, looking at us, attempting to understand our humanity – attempting to empathize with us.

Empathy and Emerging Worldviews

El-Sayed El-Aswad

Department of Sociology, United Arab Emirates University, Al-Ain, United Arab Emirates
Bloomfield Hills, MI, USA

Taking empathy as an aspect of social life, this inquiry examines how far empathy impacts peoples' relationships and how far these relationships generate certain religious and nonreligious worldviews and practices.

People's perceptions of themselves and of the worlds in which they live have been given less attention than their economic activities and political ideologies. However, this does not negate that "individual worldviews are socially embedded and controlled by large-scale social and economic forces" (Schlitz et al. 2010, 24). It is a matter of worldviews and religious orientation that give social, private, economic, and political domains themselves a subordinate position within the larger whole. The main concern here is not merely with the intellectual aspects of the worldview but also with the social, emotional, and subjective domains in which individuals understand the "other" as well as themselves in their relations to others.

Empathy is not just a part of the worldviews but also contributes in making up certain core elements of these worldviews. Empathy is defined by Mariam-Webster Dictionary as "the action of understanding, being aware of, being sensitive to, and vicariously experiencing the feelings, thoughts, and experience of another of either the past or present without having the feelings, thoughts, and experience fully communicated in an objectively explicit manner." According to Carl Rogers (1957, 99), empathy is a process through which one is able to "sense the client's private world as if it were your own, but without ever losing the 'as if' quality." Empathy is the ability to understand thoughts and feelings of

another person. Empathy has long been associated with prosocial behaviors such as altruism, philanthropy, and generosity.

The differentiation between the self and the other or nonself, a basic component of “worldview” (Redfield 1962, 95), is created not only through daily social interactions but particularly through empathy that helps the “self” understand the “other.” Empathy helps people to become aware of themselves and of “others” as well as of events that occur in their lives. Further, empathy has been viewed as a core component to delivering compassionate care to patients. Psychological and cross-cultural studies indicate that both cognitive and affective elements are present in empathy (Kohl 2008, 177).

Carl Jung (1954, 120) points out that worldview, embedded in an individual’s psychology, is unconscious and culturally transmitted. It constitutes an important element that impacts the perceptions and choices of a person. Worldviews, contingent on personal experiences and cultural traditions, are clusters of ideas, beliefs, feelings, shared meanings, or understandings and practices that render social life possible (El-Aswad 2012). Individuals construct and alter worldviews, but worldviews also shape and impact individuals.

For Carl Jung, worldviews, like religious doctrines, are emotional experiences. They “are an integral part of each individual’s psychological makeup and greatly influence volition, affect, cognition, and behavior. Worldviews act outside of consciousness and are part of the warp and woof of personality, rather than being deliberate intellectual constructions” (Koltko-Rivera 2004, 9). The possession of a worldview is inevitable as a condition of human life. Both the therapist and the patient have to come to grips with the issues raised by conflicting worldviews.

Worldview and Ideology

People’s worldviews are treated here not as an ideological system but as a system of meanings generated and enacted in different courses of public and private scenarios. This article develops a

distinction between worldview and ideology. While ideology implies certain economic and political orientations related particularly to power, worldview indicates belief systems and related symbolic actions. Ideology “is essentially linked to the process of sustaining asymmetrical relations of power—that is the process of maintaining domination” (Thompson 1984, 4). Worldview is an interpretative and integrative paradigm encompassing assumptions through which people view the world in which they live and with which they interact. Worldview is comparable to “Weltanschauung,” “meaning system,” “patterns of thought,” “perceptual framework,” “cognitive orientation” (El-Aswad 1990, 2012), or what Charles Taylor (2004, 249) calls “social imaginary” (El-Aswad 2012, 7-10).

Worldview, embodied in the practices and discourses of large groups of ordinary people, reveals inner meaning systems made of assumptions and images in accordance with which the universe, including the society and person, is constructed.

The significance of religion and spirituality in a materialistically oriented and globally dominant and changing world has been a nexus of current debates in humanities and social studies. Religion encompasses organizations, institutions, creeds, doctrine, beliefs, or sanctified worldviews and community. Religion and spirituality are interconnected as they both refer to seeking the sacred (Giordano et al. 2014, 55). A recent study conducted in the USA concludes that there is a positive relationship between empathy and religion, spirituality, intrinsic religiosity, and theological pluralism. When a worldview is sanctified, it becomes as real as the natural world. Within this context, sanctified worldview helps people cope with social problems as well as with personal suffering by providing explanations and solutions, real or imaginary, which make life comprehensible.

The Emerging Worldviews

The notion of empathy and related concepts of understanding, participation, subjectivity, and

spirituality provides the possibility of the emerging worldviews. Worldviews are grounded in people's experiential participation in what is present, in what there is. The notion of participation is central to the emerging worldview. People can only understand the world as a whole if they are part of it. Experiential knowing can be achieved through direct face-to-face relationship with people; it is knowing through empathy and is almost difficult to put into words (Reason 1998, 3). Within a holistic perspective, making whole implies participation in other peoples' worldviews. One important feature of a participative worldview is that the individual person is restored to the circle of community and the human community to the context of the wider natural world or cosmos. Another feature of a participatory worldview is that meaning and mystery are connected to human experience in such a way the world is viewed and experienced as a sacred arena (Reason 1998, 7). Empathy can help create a shared worldview that then becomes the base for reaching the person's or client subjective reality. In this case, participating in and sharing other people's beliefs and feelings lead to a shared or emerging worldview (Kohl 2008, 187).

Worldview is a broader paradigm that is influenced by interactions with people, but it also provides the holder a belief system within which to manage perceptions and new experiences within the context of their social and religious milieus.

The relationship between empathy and emerging worldviews can be illustrated by the following examples. Recently, some people combine their personal experiences, insights, and intuitions with knowledge and insights of science, as well as of religion, philosophy, and spirituality. However, they do not seem to turn away from the worldview that they inherited but rather cultivated different ways of understanding life and the world (Hedlund-de Witt 2014, 204).

The transformation of worldview is facilitated by engaging in participation and conversation that pay attention to the perspectives of other persons. Examples from interpersonal neurobiology show that the human brain develops through intimate

relationship with other people such as mothers, fathers, extended family, and members of wider communities). Another transpersonal psychology is concerned with experiences that connect people with a broader sense of self that goes beyond the individual to involve transcendent or spiritual beings (Schlitz et al. 2010, 27-30).

The following example relates to the emerging worldviews of mysticism in Islam. The mystic worldviews in Islam are manifested in Sufism (taṣawwuf) and, though differently, in other forms of esoteric worldviews of the Imamate Shi'a (El-Aswad 2012). The focus here will be on the Shinnawiyya Sufi Order in the city of Tanta (the Nile Delta, Egypt). Compassion and emotional intimacy are closely related to underlying values of this Sufi Order. Members consider their Sufi Order as a kind of communally oriented circle anchored on a commitment to shared sacred tenets and values. A member of the Shinnawiyya Sufi Order recounted, "When a Sufi says, 'follow your heart' or 'consult your heart', he is fully aware that he acts not only as an individual but also as a member who complies with the ethics of his Sufi order" (El-Aswad 2006). The Order's identity becomes part of each adherent's own individual identity as being a Sufi belonging to a specific Order. A new member conforms to the Sufi Order without losing his individuality. He can gain knowledge of his real self, learning the desirable characteristics to which he aspires and the defective attributes against which he must protect.

Sufis seek both to suppress the idea of aggressive materialism confined to this transitory world and to elevate the spiritual quality inherent in people. This spiritual higher consciousness enables people to be aware of higher dimensions of being as well as of the hidden secret that can be transmitted through faith. In their gatherings, Sufis feel secure to express and expose, emotionally and spiritually, what they consider as pure and true. They see themselves on a path of self-discovery; a path of growth, which they hope will lead to spiritual empowerment and ability to love and share. To varying degrees, they see the possibility of making a better world, starting with their immediate personal relationships with

members of the Order, friends, family members, and others within the broader society (El-Aswad 2012, 170). Implicit worldviews emerge and become explicit through empathy and people's discursive and nondiscursive actions. What is unimaginable, esoteric or invisible, absent, and incomprehensible becomes, through empathy, words, recitations, narratives, rituals, bodily symbolism, and art displays, imaginable, visible, present, and comprehensible.

Empathy Expanded

Lee W. Bailey

Department of Philosophy and Religion, Ithaca College, Ithaca, NY, USA

A mother was watching her 2-year-old daughter and 4-year-old son play around in a pool of water. The little girl splashed her brother a bit too much, and he pulled back, wiping his eyes. She leaned in and said "Oh, I'm sorry. I love you."

This girl demonstrated empathy, in the standard sense of intuitively understanding what her brother was feeling – a bit overwhelmed by the splashing. Her empathy included sympathy and bonding, apologizing, and assuring him of her loving family unity. This innocent child's caring empathy is natural, but sadly lacking in the world today. This lack is part of our painful problems of human alienation. These problems are very serious, and we need to *expand* our understanding of empathy into more conscious awareness, its definitions, dynamics, and scope.

Empathy's definitions incorporate a wide field with two commonly thought extremes: (1) One side is *cognitive* or thinking about it (to "put myself in another person's shoes" or "see from another's perspective"). (2) The other is *affective* or feeling it (emotional, unconscious, and verbally or nonverbally expressed, as in gestures, such as a smile or frown, or when we can intuitively "see it in their eyes," referring to grief, joy, and many other feelings). These extremes seem to be two pure types. But to reduce empathy to "cognitive" or "affective" type is far too restrictive. On the contrary, a new *field* approach sees it as a mistake to frame the problem narrowly in the dualistic object/

subject worldview, as in: “Can empathy be dealt with scientifically or it is a purely private matter?” (Basch 1983).

Both are narrow extremes of a wide-field spectrum with many overlapping, blending phenomena, including conscious reasoning, relationships, body language, music, art, and spirituality (Rummel). Empathy is very intuitive and can provide very valuable functions, such as bonding and important insights. It can be positive, as in “I love you” or a kiss, or negative, as in “I don’t trust him” or “the cold shoulder.” Empathy comes to consciousness through our personal and collective unconscious soul fields. The conscious and unconscious field elements need to work together, not as two separate categories. Often important intuitive feelings need mindful reflection to increase accuracy (as in romantic relations), and conscious ideas need to acknowledge deeper feelings to be more authentic (as in trust). Empathy has an ancient background in evolutionary history, verbalized in many ways in philosophical, psychological, scientific, and spiritual ways, such as Martin Buber’s (1923/1970) “I-Thou” relations and Matthew Fox’s *Creation Spirituality*. Rather than “reduce,” “define,” or “make finite,” we can see empathy more expansively and authentically, inhabiting large fields in different contexts, blending cognitive, emotional, and spiritual aspects.

When they say “empathy,” some people mean a narrow cognitive experience, but often they implicitly include other elements, such as the ethical urge to help. Empathy can also be an intuitive expression of the numinous bonds among beings, with added cognitive content, such as intimate, social, and natural bonds, seen in many ways over centuries. Think of the family bond in the Torah commandment “Honor your father and your mother” (Exodus 20:12). Jesus said: “Love your enemies, do good to those who hate you” (Luke 6:27). The Hindu greeting with a bow and hands pressed together, “Namaste,” meaning “I bow to the Divine in you,” is a refined numinous expression of empathy honoring the presence of the sacred bond in the moment. I once met a Buddhist monk and I casually asked him: “Where do you live?” He took a

deep breath and replied “In the solar system.” I bowed to his opening of such a wide range of empathy.

These are examples of the countless ancient ways to symbolize and verbalize the many collective experiences that we call “empathy.” The English word for “empathy” comes from the ancient Greek prefix *em* (in) combined with *pathos* into *ἐμπάθεια* (*empathēia*) meaning “in suffering, passion, or affection.” The nineteenth-century European discussions of art and poetry in aesthetics used terms such as “sympathy” in complex debates about the roles of subjects and objects in art, but now we are expanding the exploration of empathy beyond such narrow dualisms (Vincent 2012).

In the late nineteenth century, several scholars explored the German word *Einfühlung* (feeling into) that was later translated into English as “empathy.” Robert Vischer used this in his discussion of aesthetics in 1873, advocating “projection” as the dynamic behind *Einfühlung* (Vischer 1873; Nowak 2011). In 1875 Freud introduced the theory of “projection” into psychoanalysis (Freud 1974, Ch. 1, pp. 206–212), and its usage as a kind of empathy has expanded. All this was still within the subject/object paradigm. *Einfühlung* was used in an aesthetic and psychological way in 1903 by the philosopher Theodor Lipps, who influenced Freud. The psychologist Edward Titchener introduced the term “empathy” in 1909, to translate the *Einfühlungsvermögen* [capacity for empathy], in the senses of perception, introspection, and interpersonal empathy. But such explorations remained rather theoretical and not yet very helpful, for settings such as psychotherapy, where Freud made “projection” a valuable dynamic of implicit empathy, where the goal is to “withdraw” a feeling that you imagine you perceive in another back into your own subjectivity and take responsibility for it.

By the latter half of the twentieth century, empathy became a widespread topic in psychological literature. The problem of multiple definitions of empathy was amplified, since there is no clear agreement on the description and its dynamics. Some options have been feeling into projection, bonding, mirroring, intersubjectivity, taking

another's role, sympathy, association, inference, relatedness, intuitive insight, I-Thou relations, and participation (Eisenberg and Strayer 1987; Katz 1963; Basch 1983). Empathy is so common and complex that experimental efforts to narrow down the concept have been frustrating. Cognitive, empirical, experimental efforts to abide by the literalist scientific method were frustrated by this plethora of theories. But it brought some good results, such as clarifying the positive/negative ambivalence of empathy and pointing out the danger of losing boundaries and becoming absorbed into another's psyche (Eisenberg and Strayer 1987; Sideris 2013).

The more affective, emotional intuitive, therapeutic, archetypal, and spiritual approach speaks with more poetic and evocative language, to "get" it, such as: "You could see it in his eyes." This has the benefit of direct experience that requires an intuitive sensitivity to enter into a collective bond (Rogers 1980). The study of empathy requires not just thinking about it, but opening into a field of overlapping cognitive observation and experiential participation. You might want to avoid errors by asking the other person whether your perception is accurate.

Empathy Deficit

Many thinkers regard our culture as lacking in empathy, a problem amplified by some new technologies. This issue was highlighted in the US President Barack Obama's emphasis on our "empathy deficit," following the tragic explosive attacks on the World Trade Centers in 2001. For some years afterward in speeches, he stressed this collective problem; he said:

The biggest deficit we have in this country and in the world is an empathy deficit. We are in great need of people being able to stand in somebody else's shoes, and see the world through their eyes. . . . I [do not] pretend to understand the stark nihilism that drove the terrorists that day and that drives their brethren still My powers of empathy, my ability to reach into another's heart, cannot penetrate the blank stares of those who would murder innocents with abstract, serene satisfaction We must . . . engage in the more difficult task of understanding

the sources of such madness. The essence of this tragedy, it seems to me, arises from the fundamental absence of empathy on the part of the attackers, an inability to imagine or connect with the humanity and suffering of others. (Obama 1995–2015)

Alienation

The most empathetic, refined, and supportive phenomena of empathy, such as family and love, at their best are positive. But there are also negations of empathy, such as apathy, detachment, or cruelty. For example, some physicians are frustrated with strictly detached scientific medical practice that to patients can feel cold and alienating. They have called for a movement to supplement rational diagnostic and treatment attitudes with empathy. An increase in positive attentive listening or empathy – a good "bedside manner" – can bring a healing atmosphere of caring and understanding. Prof. Dr. Jodi Halpern's 2001 book *From Detached Concern to Empathy: Humanizing Medical Practice* calls for more empathy. She urges doctors to ask for and listen attentively to patients' relevant life stories and concerns, which, she finds, promote empathetic trust and healing. Even listening respectfully to dying patients' fears, dreams, and visions is increasingly considered important (Hoffman 2016).

In schools bullying is a problem that Canadian educator Mary Gordon has been counteracting with experiences of empathy. She and other teachers take an invited mother and her baby into grade school classrooms, and they sit surrounded by the students and teacher. She asks the students what they think the baby is feeling. This brings out surprisingly empathetic responses from students, and even some aggressive ones soften up. Bullies usually suppress their empathy, but with these babies, they frequently reveal their concealed feelings. If the baby is afraid, the mother will empathetically hold, cuddle, rock, and soothe the little one. Often angry students have missed this at home and are defensive about it. But in these exercises, they see a good, empathetic parent-child relationship that they deeply crave. When these feelings are expressed in a safe environment, sometimes the children's

eyes tear up. They are expressing their feelings, and they are respected for showing natural and healing feelings. Pass the tissues. Hold hands. Look them in the eyes. Honor and help bring out their true goodness. As Gordon says: "... it is emotion that truly changes behavior" (Gordon 2005, p. 39). Helping them "catch" empathy early is important for an emotionally healthy development.

Expanding Empathy

Empathy is often a nonverbal phenomenon with a range wider than words and definitions. Very frequently it takes unexpected form beyond individuals, such as tattoos. When you get a tattoo, you join a group with visual messages. So the interpretive task is important, a hermeneutic challenge of "reading" such expressions as if they were dreams or visions that need to be "caught" before they fade. Watch for people "tossing" empathetic comments or images that may contain nuggets of important hidden feelings for you to notice, such as "Oh, you won't call me again." That is likely an empathic "hook" that asks for some kind of a respectful or positive, sincere answer.

To develop a sense for unconscious imagery and feeling, one can keep a reflective dream journal; study psychologists of the unconscious, such as Carl Jung, to learn some interpretations; explore arts and music; study and practice meditation with authors such as Thich Nhat Hanh; and go to meditation groups and workshops. We can broaden our "catches" of empathy with studies of various languages, arts, music, literature dance, sign language, and romantic interactions. How do these feel? What might they mean? An empathic "call" may be a communal purpose that comes from the deep collective unconscious, such as a call to a certain career. Empathy may be *positive* and pro-social, as in compassion, wonder, love, forgiveness, and ethical actions, such as working for social justice or environmental health. But we must not neglect the *negations* of empathy that stand opposite to empathy, such as domination, the empathy deficit, and horrors such as the Holocaust. These urgently call for

transformations into healing empathy to help people out of despair or revenge. Some police use their empathy to spot conflicts, detect lying, and soothe victims. Some clever officers have been spontaneously doing popular dances in public with kids, to overcome negative empathetic relations and defuse conflict (Eun 2015). These are important psychological and spiritual themes that need recognition and practice. Positive empathy is the most refined, caring type, with ethical actions.

Empathy is very important in *psychotherapy*, demonstrated in various ways by many therapists, such as Sigmund Freud, Carl Jung, Heinz Kohut, and Donald Winnicott. They emphasize clinical dynamics such as dream interpretation, transference, and the need to nurture, hold, and play with children as much as possible. Winnicott respects their highly empathetic dolls, teddy bears, and "blankies" as little images of themselves being securely cared for. This is all to give them emotional security. Heinz Kohut said: "the essence of psychoanalysis lies in the scientific observer's protracted empathetic immersion into the observed, for the purpose of data-gathering and explanation" (Kohut 1977, p. 302). Therapists such as Carl Rogers and Peter Breggin stress that empathetic listening and a healing presence are *the* most important healing factors in psychotherapy.

Empathy is also a very important factor in both institutional *religions* and *spirituality*. They have major roots in the bond of empathy. Authentic religious faith is not just simplistic tribal unity or cognitive acceptance of miracles or authority. Faith also includes the conviction that ultimately goodness overcomes evil and the implied commitment to goodness. This requires positive empathy, as in family and social bonds, as well as understanding the soul's dynamics, such as childhood development.

Religious faith typically includes belief in a divinity or divinities that cultivate positive empathy or are seen as the power of goodness: "God is Love." Religions give civilizations good ethical guidelines (that commonly need updating), such as the Ten Commandments, and spiritual principles, such as forgiveness and compassion for the suffering. Portraying the divine as the creator

symbolizes the ultimate power of goodness as the absolute cosmic power in the struggle with evil and suffering. But old images of this symbolic moral affirmation may seem implausible when scientific explorations develop a more naturalistic view of creation and nature. Then religion can become an authoritarian and judgmental bastion against other social groups and contrary science, clinging to literal interpretations of scripture, which is fruitless. Or religions can amplify their positive empathy, as Pope Francis has done, with new open views on sexuality and global warming. He sent shock waves through the Roman Catholic Church in 2013, when he said that “the church had grown ‘obsessed’ with abortion, gay marriage and contraception” (Goodstein 2013). Religion and spirituality are two extremes of a field. Believers commonly pick and choose acceptable elements or religion, placing themselves in the field between extremes. Many US Roman Catholics use officially forbidden birth control, but still participate in Church because they like the empathetic stories, relationships, and rituals of the Church. Roman Catholic Womenpriests are ordaining women in order to embrace women in leadership in opposition to the Church’s official patriarchal structure (Roman). Empathy is central to both religion and spirituality and their changing dynamics. Focusing on authentic empathetic themes such as love, rather than backward-looking traditions such as patriarchy, is very important.

Spirituality is an empathetic, interfaith exploration whose interpretations of spontaneous mythic symbols express intuitive, fluid, and creative truths and transformative experiences, such as meditation, near-death experiences, dreams, and visions. New spiritualities are open to the best in various religions, and they look behind literal interpretations of scriptures, such as an old man in the sky, or dogmas such as original sin or repression of sexuality. Rather they adapt and inspire more compassion, tolerance, and emphasis on new stories (such as evolution), rituals (blessing the animals), and ethical needs, such as open-hearted support for racial and ethnic varieties, women’s rights, and empathetic language

such as “the Light,” or “the presence of being.” Psychotherapy can be a valuable part of spiritual journeys, helping heal emotional and spiritual scars and cultivating positive empathy, as in couples counseling before and during marriage, to increase empathy, prevent problems, and maintain the marriage bond.

Carl Jung’s archetypal psychology is an important empathetic fountain of the stream of spirituality, not only in psychotherapy but also in cultural psychology. Jung freed myths from the medieval Christian meaning of error or “pagan” idle tale and showed myths’ empathetic power to draw readers into the symbolic “truths” of the many dramas of the collective unconscious. Post-Jungians have developed a wide range of empathetic therapeutic interpretations, practices, and cultural studies that expand Jung’s insights, such as the feminine soul in fairytales (Samuels, Von Franz). The mythic heroic journey of the soul in the collective unconscious in Joseph Campbell’s theory builds on several archetypal patterns common in myth literature and cinema, such as initiation, dragon battles, sacred marriage, resurrection, and return to consciousness, healed and capable of spiritual leadership. George Lucas said that he drew major inspiration for the empathetic film *Star Wars* from Campbell’s hero’s journey (Lucas and Moyers, Brennan). David Leeming explores a wide scope of mythic themes worldwide. Clyde Ford investigates African mythic traditions. These myths are very empathetic expressions of soulful stories that offer healing participation and understanding.

James Cameron’s sensational archetypal film *Avatar* brings to light very empathetic themes. On their mythic planet Pandora, indigenous Na’vi people’s goddess is Eywa, present especially in her glowing tree. She is capable of resurrecting the dead. When the tall, blue native people greet each other empathetically, they say “I see you.” Plants glow and respond to human’s presence and touch. Their bonding and communicating energy is present in their roots underground. Warriors bond with flying dinosaurs on mountains floating above their mythic planet Pandora. They bond

by connecting a horse or flying dinosaur's long earlike antenna with the warrior's braided ponytail-like queue, so they can move together empathetically. The hero Sully fell in love with the heroic chief's daughter Neytiri, who taught him to "see" empathetically. His transformation by her love and her people's natural empathy and ecological spirituality was the major revolution in this mythic epic.

The Na'vi people and their planet, saturated with empathy, are contrasted with the earthly corporate/military, colonialist, high-tech, aggressive, greedy, violent attack on the sacred planet, in Cameron's powerful allegorical parallel to Earth's environmental conflicts. But, in a huge fiery battle (high-tech mercenaries vs. low-tech empathetic bonding, even with animals), the technomercenaries are defeated. The film mythically portrays transforming empathy in a few Earth people, Pandora's indigenous people, animals (such as the flying dinosaurs), plants (such as the goddess Eywa's sacred tree), and empathic transformations in the hero Sully and among the Na'vi and especially in the heroine Neytiri (Cameron 2007; Sideris 2013). These mythic portrayals of natural, archetypal feelings and images can expand our empathetic self-understanding and spiritual meanings in important cultural transformations, such as the conflict between mechanical, domineering cultures and ecological, empathetic, spiritual cultures.

Feminist religion scholars, such as Ann Belford Ulanov, Carol Christ, Clarissa Pinkola Estés, Phyllis Trible, Monica Sjöö, and Catholic Womenpriests, have stretched spiritual empathy into wider realms – strong women in leadership and goddesses. In this time of potentially increased education for all, a dangerous global population explosion and contraception, some religious groups need to expand their empathy in such directions. In Buddhism, the Dalai Lama, Joanna Macy, Thich Nhat Hanh, Christopher Queen, and others have expanded the meditative tradition into new ethical actions. Some have shown empathy and support for the Dalits, or outcasts in India, in a new movement called "Engaged Buddhism." Afro-American activists

such as Martin Luther King are showing their sacrificial spirituality ("I have a dream") and courage in opposing racism. Native American activists also stand tall with their nature spirituality and bravery ("Earth is our Mother").

Increasing awareness of empathy also brings a major challenge to explore various cultural *world-views* empathetically, as Ninian Smart does. The "re-enchantment" shift is working to shift out of the old disenchanting subject/object dichotomy into a more soulful world that opens up empathy's powers (Hillman, Moore). The urgency of an increased role of empathy has wide horizons. Perhaps the most important thought about empathy is that when we think of it as experiences between two individuals, we are still caught in the subject/object dualism and individualism of lonely ones in despair today. Wouldn't it be interesting if we were to re-experience and rethink empathy as a vast field of ageless evolutionary, ethical, peaceful, joyous spiritual energy in which we all participate? Imagine a cheering crowd at a concert enraptured by the wondrous music and dance in which the audience all passionately flow together, bonded in tingling with the amazement of it all, in empathy surfing on the surging waves of the awesome ocean of being.

Empathy in Humans

Dan Haldeman
Department of Integral-Transpersonal
Psychology, California Institute of Integral
Studies, San Francisco, CA, USA

Introduction

How do humans experience and understand empathy? Merriam-Webster defines empathy as:

The capacity for experiencing as one's own the feelings of another; the action of understanding, being aware of, being sensitive to, and vicariously experiencing the feelings, thoughts, and experience of another of either the past or present without having the feelings, thoughts, and experience communicated in an objectively explicit meaning. (Merriam-Webster 2003)

Tobin Hart frames empathy within a context of opening to another by paying attention to the person: “When we pay attention to the person in front of us and simply open ourselves we come closer to understanding their experience” (Hart 1999).

Empathy = Synergy

This empathic/synergistic response to another points to a nonverbal/nonordinary form of experiencing, a *synergy* between people, and has been noted as central to/the main core of psychotherapy (Rogers 1961) and one of the principal

elements to a successful therapeutic relationship what he calls *empathic understanding*:

When the therapist is sensing the feelings and personal meanings which the client is experiencing in each moment, when he can perceive these from *inside* as they seem to the client, and when he can successfully communicate something of that understanding to the client. (Rogers 1961, p. 62)

For Hoffman empathy represents the base of moral development (Hoffman 2000), and for Azar it is a characteristic that points up our most human nature (Azar 1997). Certainly the more empathy is observed first in us then in others the more it becomes apparent that there are many shades of meaning to empathic response (Bohart and Greenberg 1987; Gladstein et al. 1987). The Russian mystic, psychologist, and philosopher George Gurdjieff frames empathy as *external consideration*: an ability to project oneself into the other's shoes by comparing experiences with the other's experiences in order to understand what they might be experiencing. In this sense, external considering is characterized by an empathic exchange of shared experiences coupled to a realization that the other and you are the same (Ouspensky 1949).

Heart/Mind Synergy

The British philosopher/priest Rodney Collin (1958/1976) notes that empathy is a characteristic of an *awakened heart*. For Collin this means being able to live and judge from the heart rather than from our *mechanical mind* by shifting the center of attention in ourselves from thinking about the other to feeling the other. It is this subtle, quiet feeling that needs to be heard over the flood of reactions, explanations, excuses, and theories from mind. By listening carefully to what the heart says and remaining quiet inwardly, it is possible to become more empathic than reactive by increasing our head-heart connection. As Collin notes, “Mind must bring reason and principles and tradition to justify and fix into permanent understanding the heart's fleeting glimpses of conscience and certainty” (Collin 1976, p. 97).

Using our emotional brain to influence normative consciousness is another characteristic of an evolving heart-mind connection, as Joseph Chilton Pearce reminds us in his book *The Biology of Transcendence: a Blueprint of the Human Spirit* (Pearce 2002):

Our emotional-cognitive brain has direct, unmediated neural connections with the heart. Through these neural connections the positive and negative signals of our response to our present moment are sent to the heart moment by moment. (p. 70)

Pearce's assertion that a development of heart-mind ontology as a world view was also a finding of an earlier study by Mayer and Salvoney in 1990 on *Emotional Intelligence* (EI), in which the authors concluded that intelligent emotion has these characteristics or features: *an ability to understand and communicate emotions; an ability to recognize and regulate emotions in others and the skill to know when this is appropriate, and an ability to make emotional regulation part of an effective life style* (p. 32).

As noted above, empathy has a cognitive and an affective component, and it is this affective sensitivity that needs to be enhanced through regular use. Returning again to Carl Rogers who so adequately captures this feeling:

The state of empathy, or being empathic, is to perceive the internal frame of reference of another with accuracy and with the emotional components and meanings which pertain thereto as if one were the person, but without ever losing the *as if* condition. (Rogers 1961, p. 210)

One key from Rogers is contained with his description of knowing the other *as if* one where the other. Maintaining this *as if* condition is the essence of attention regulation, or using attention to change perception. Gurdjieff likens this state of consciousness to a *third state* differing from our ordinary first and second states of consciousness, sleep, and waking, and one characteristic of the third state is divided attention, meaning a change in the subject-object dynamic. As Talbot points out in his existential treatise, *The Holographic Universe* (Talbot 1991), "Virtually all of our commonsense prejudices about the world are based on the premise

that subjective and objective reality are very much separate" (p. 80).

Mechanics of Empathy

The notion that the dynamics between *I* and *It* can be changed by changing the conceptual lens of viewing *I-It* is one of the important themes presented by Gurdjieff, what he termed *dividing attention*. Ouspensky likens dividing attention to a non-ordinary state of consciousness:

In an ordinary psychic state I simply look at a street. But if I divide my attention while looking at the street, I do not simply look at the street; I feel that I am looking, as though saying to myself: 'I am looking'. (Ouspensky 1949, p. 188)

In ordinary causal consciousness, subject-object relations are seen as:

Subject → Object

The arrow indicates attention. This one way focus of attention is a state of identification. Self-observation can reveal that there are degrees of identification dependent on attachments or vested interest in an object. For my purposes here, identification is a state of consciousness where the focus of attention is wholly on the object. For example, as I write this paper if one or more of the identifications possible in this moment overrides the writing taking place, then this paper could become an imaginary quantity.

The conceptual change being proposed occurs when attention becomes divided as indicated exposing the nature of ordinary consciousness:

Subject ↔ Object

The application of dividing attention in causal relationships reveals that one of the main deterrents to experiencing this state in a more regular manner is the continued support of a dualistic lens, *I-It*, for observed phenomenon both external and internal. The validity of the feeling of being separate, of being an individual, is directly challenged by dividing attention. Ontologically,

practicing dividing attention brings the focus of living to those experiences of nondual consciousness as benchmarks along a transformational direction. Stan Grof has named these nondual states, *Holographic* indicating that they “tend toward wholeness” (Grof 2000, p. 2). Empathy can be seen as a Holographic state of consciousness. In a Holographic state, seer becomes aware of seeing, as well as feeling awareness. In the recognition of being aware of awareness, observer has become the observed, producing a reversal in causation; effect may now be felt as cause as the subject-object duality expands to include a trinity: subject, object, and presence, seen as a state of consciousness where person and observer become the same experience, an empathic experience.

Conclusion

At the heart of an empathic experience is a lessening of the separate self as the center of experience, an experience of an integrated self. Dividing attention as a means to integrate self-concept occurs with a realization that in ordinary/waking consciousness, self-concept is based upon a limited view of self. Walsh (2015) reminds us that to integrate self-concept means to experience self in relation to a larger view or concept. This state of consciousness was so aptly captured by the fifteenth century Japanese Haiku poet, Matsuo Basho: “I see the flower and the flower sees me” (Spivak 1997). Experiencing seeing a flower and in turn being seen by a flower is at the essence of what Chadhuri (1977) termed the *unity of opposites*:

Everywhere in actual life we find that opposites meet, and there is always a middle ground which it is our task to discover, because that gives us the secret of balanced growth or integrated self-development, the secret to attaining an integral vision of the total truth. (p. 90)

Buber reminds us that, “all real living is connecting” (Buber 1923/1958, p. 11) and from this perspective empathy exists as humans connect to one another.

Empirical Research

Emeka Thaddues Njoku

Department of Political Science, University of
Ibadan, Ibadan, Oyo, Nigeria

The term “empirical” entails gathered data based on experience, observations, or experimentation. In empirical research, knowledge is developed from factual experience as opposed to theoretical assumption and usually involved the use of data sources like datasets or fieldwork, but can also be based on observations within a laboratory setting. Testing hypothesis or answering definite questions is a primary feature of empirical research. Empirical research, in other words, involves the process of employing working hypothesis that are tested through experimentation or observation. Hence, empirical research is a method of uncovering empirical evidence.

Through the process of gathering valid empirical data, scientists from a variety of fields, ranging from the social to the natural sciences, have to carefully design their methods. This helps to ensure quality and accuracy of data collection and treatment. However, any error in empirical data collection process could inevitably render such data invalid. According to Dilworth (1982), empirical research is fascinating because, if it is appropriately designed, the research cannot fail. Empirical research is systematized so that the data collected can be specifically tailored to the research question or questions. It addresses key inquiries deemed critical, as it helps in producing insight about a specific issue of interest to the researcher. Empirical research must be systematized in such a way that the research conclusions can be tested and more important, that the research is replicable.

McLeod (2008) noted that empirical research, as a tool for investigation within the field of psychology, began in the 1800s with behaviorists who assert that psychology is a scientific discipline, which requires scientific principles in investigating human behavior, stressed its use. They further claimed that there are unseen factors that

influence human behavior. They established the use of laboratory-controlled experiments.

The history of empiricism can be traced to the works of a sixteenth-century British philosopher, Francis Bacon, who proposed empiricism as a new form of gaining knowledge. He believed that the acquisition of knowledge could only be effectively achieved through the observation in and of the real world. His views led to the idea of empiricism as a major branch of philosophy. This was a major turn in from theological dictums that pervaded human inquiry and rationalism during the third century. Empiricism, therefore, became a major contradiction of the long held concept of rationalism established by the Greek philosophers, Plato, Aristotle, and Socrates, that knowledge can be acquired through systematic and logical thought processes. Bacon stated that gaining knowledge through empirical pursuit as opposed to rationalism aided in the emergence of “inductive methods of scientific inquiry,” which entails experimentation, measurement, and systematic observation (Bhattacharjee 2012, p. 7).

During the seventeenth and the eighteenth centuries, thinkers such as David Hume and John Locke popularized and entrenched empiricism as a major core in philosophical investigation by applying the method in their philosophical inquiry (Matin 1968, pp. 33–47). They further posited that, “experience provides the marks of criteria of knowledge and these criteria may be subsequently used to determine the extent of our knowledge” (Hossain 2014, p. 226). During the same period, German philosopher, Immanuel Kant and French philosopher, Auguste Comte sought common ground between empiricism and rationalism. While Kant (1783) argued that “experience is purely subjective and processing them using pure reason without first delving into the subjective nature of experiences will lead to theoretical illusions,” Comte and Bridges (1865) further asserts that “while theory may be created via reasoning, they are only authentic if they can be verified through observations.” This concept is termed positivism (Bhattacharjee 2012, p. 8). Furthermore, in 1992, Koch asserts that positivism influenced, for example, the development of operationalization in psychological research

methods. It is a process of providing an operational definition of concepts so as to make a concept understandable, applicable, and measurable.

In 1971, Heisenberg noted that, positivism in the twentieth century experienced criticism from German sociologists, including Max Weber (1991) and George Simmel (1908). They argued that research on social processes, human norms, and values can only be understood subjectively rather than through the use of positivism, which emphasizes quantitative research strategies and approaches, such as surveys and experiments that are considered devoid of clear philosophical grounding. Furthermore, these were of the view that the interpretivist approach should form the bases of studies focusing on social realities, in an effort to uncover meanings and rationales that influences social activities. This resulted in the emergence of post-positivists or post-empiricism such as Popper (1963), who argued that knowledge is not absolute because it is based on suppositions that cannot be proven but can be challenged through empirical research.

Enlightenment

Wing-shing Chan

Faculty of Medicine, The Chinese University of Hong Kong Special Administrative Region of the People's Republic of China, Shatin, NT, Hong Kong

Enlightenment generally refers to phenomena involving a significant change of consciousness regarding the self, others, and the universe with accompanying physiological, perceptual, and conceptual changes that result in significant spiritual or moral changes. It is commonly used in Chan (Zen) Buddhism to refer to the experience resulted from accomplishment in practice, meditation, or insight that is synonymous as seeing the Buddha nature or self-nature or discovering the true or original mind.

That the experience of enlightenment is a critical step of spiritual change toward Buddhahood instead of exercising ritual practice, performing philanthropy, observing ethical disciplines, or merely cultivating calmness meditation had been an emphasis of the Chan school beginning from Bodhidharma. The emphasis on the practice and

concept of sudden enlightenment began to gain ground and become the mainstream with the systematic and institutional propagation by the school following the Six Patriarch Huineng.

objective world is perceived same as before, but the mind is unshaken by the world in leaking vexations. This can be regarded as full enlightenment.

Definition and Critical Stages

Enlightenment is an experiential realization of the Buddhist philosophy of no-self and the liberation from inner vexation leakages. The sense of self versus others is broken through with the dissolution of the subject-object duality due to the cessation of the mind's uncontrollable discursive and illusive thoughts. It is sometimes being described as the experience of the "shedding of the body and mind" or "the falling off of the bottom of a paint pail." Whether there is any experience of light or some specific exalted blissful feeling is not its primary concern.

The development of enlightenment may be most easily understood through the Ten Ox Herding Pictures (Sheng-Yen 1988). They represent the successive stages from beginning practice to helping others after full enlightenment. The story describes the journey of an ox herder, a practitioner, looking for his lost ox, the enlightenment mind. Some milestones are the following:

- (1) the third picture – Seeing the Ox: It refers to the first discovery of the true mind with no illusive thoughts. This can be regarded as the initial enlightenment experience, seeing Buddha nature or kenso
- (2) the seventh picture – Ox vanishes and man exists: Gross practice is no longer necessary to sustain the enlightened mind but mindful awareness as subjective consciousness still exists
- (3) the eighth picture – Both vanishes: An empty circle is left without the ox and the man. Subject-object duality vanishes with the forsake of any minute effort of mindful awareness. This is usually regarded as great enlightenment
- (4) the ninth picture – Return whence they came: Water is boundless; flowers are red. The

Cultivation, Gradual Enlightenment, and Sudden Enlightenment

Meditation can be distinguished as mere cultivation or enlightenment prone by whether it is just an exercise of concentration or whether it is a universal mindful awareness without a fixed concentration focus (Chan 2004). Cultivation through concentration leads to calmness or samadhi. The release of concentrated contemplation as being crucial for attaining enlightenment is emphasized by Chan schools such as sects of Ox Head or Caodong (Soto) that employ mainly the method of meditation for enlightenment.

Enlightenment can be classified as being gradual or sudden. Meditation that works by concentration is not enlightenment prone and should be classified as being cultivation instead of the often misclassified gradual enlightenment. Gradual enlightenment practice should be capable of leading to enlightenment, although taking on a gradual unfolding path. The Ox Head and Caodong sects are examples of the gradual enlightenment schools. Sudden enlightenment schools, derived from the Huineng school, flourished with Master Mazu's masterful enlightenment initiation (see the entry on ► "[Enlightenment Initiation](#)" in this encyclopedia) methods like twisting a disciple's nose or kicking down an enquiring disciple by the chest, emphasized the attainment of sudden enlightenment instead of extended meditation cultivation. Sudden enlightenment can be understood as a sudden glimpse of Buddha nature when the barriers of illusive thoughts are suddenly dispersed. Often it is only available to people who have adequate preparation of practice and more often than not people need to continue practice, such as daily mindful awareness, after sudden enlightenment. There can only be differences in the comprehensiveness and stage of enlightenment experience, but there is not a priori difference between

enlightenment reached by gradual or sudden approaches (Chan 2008).

Methods of Enlightenment

Enlightenment may be set off by some environmental stimulus, or purposely being initiated by the act or speech of a Chan master when the person's mind is at a pre-enlightenment stage, often being still with little or no illusive thoughts due to practice or meditation. Systematic methods are employed for attaining enlightenment, like Silent Illumination or Shikantaza meditation and the practice of Huatou or gongan investigation. The meditation methods still the mind by universal mindful awareness without meditating at a fixed focus. The enlightened mind unfolds when the mind is emptied of all tiny dust of disturbance by illusive thoughts through mindful awareness meditation. The investigation methods use a phrase or episode of a former enlightenment case, and the practitioner repeatedly brings up mentally the phrase or episode and attends to the part of the mind before the case is raised. Continued practice of attending to the non-discursive part of the mind will lead to a conglomeration of the discursive thoughts to become what known as the "great doubt." When such great doubt bursts through, the enlightened mind clear of all illusive thoughts unfolds.

Intuitive insight is often enhanced in the enlightened mind that is unobstructed by discursive or illusive thoughts. However, conceptual and logical thinking are not in principle contradictory to the enlightened state. Only when enlightenment is being examined, as by Chan masters, direct and spontaneous responses become more representative of a disciple's personal experience of enlightenment than prolonged conceptual investigation.

If attachments on the self and the world can be regarded in Buddhist philosophy as the origins of suffering and evil, then enlightenment that involves a dissolution of the self and hence a lessening of attachments will lead to spiritual goodness and salvation of the person and the world.

Enlightenment Initiation

Wing-shing Chan

Faculty of Medicine, The Chinese University of Hong Kong Special Administrative Region of the People's Republic of China, Shatin, NT, Hong Kong

Enlightenment initiation refers to the events, either natural or by human that directly lead to a person's enlightenment. The Buddha is reported to be greatly enlightened when he watched the appearance of a brilliant star while meditating. Throughout the history of Chan (or Zen), thousands of people were enlightened while triggered by some natural events such as kicking a tile onto a bamboo strip or seeing one's reflection on water or being initiated by their masters through being hit upon or reprimanded.

The mystery of these enlightenment initiation events can be understood if we understand what enlightenment is involved and the mechanism that may lead to enlightenment. Enlightenment can be analyzed to be the realization of our Buddha mind (nature) when the barrier of illusive and discursive

thoughts in the mind is being removed. Enlightenment experience can occur when either the barrier of illusive thoughts in the mind is completely dissolved or when such barrier can be temporarily halted or bypassed. Sudden enlightenment as often represented in Chan consists of a temporary halting or bypassing of the illusive thought barrier of the mind. In some instances, enlightening experience can also occur when a significant part of a person's strong attachment of the self or of the world is being detached due to enlightenment initiation (Chan 2008).

Enlightenment can be broadly classified into two types (Chan 2004): (1) initial enlightenment – initial enlightenment occurs when illusive or discursive thoughts are either stopped, halted, or bypassed resulting in the revelation of the non-discursive mind. (2) Complete enlightenment – enlightened mind is sustained indefinitely without any application of concentration and illumination effort.

Common Techniques for Enlightenment Initiation

Common enlightenment initiation techniques are described in the following ways (cf. Suzuki 1949):

1. *A verbal or behavioral shock that bursts open a concentrated mind*
 Meditation or practice generally leads to a concentrated mind devoid of discursiveness. Enlightenment takes a step further by dispersing the internal effort of concentration to become a self-sustained enlightenment mind of no discursiveness. A verbal or behavioral shock or a natural-occurring stimulus applied at the appropriate moment can burst open a concentrated mind and reveal the enlightenment mind. Many gongan (koan) examples include Master Dahui initiated enlightenment in his students through shouting or hitting and Master Mazu enlightening Baizhang through twisting the latter's nose with pain.
2. *Entanglement or short-circuiting of the illusive mind*
 Some of the illogical or incomprehensible verbal statements spoken by Chan masters to their students are not to be interpreted by either Buddhist or common knowledge; they are just meant to be a way of entangling or short-circuiting the conceptual or logical habitual thoughts that are often dominated by activities of the illusive thoughts. Enlightened mind can sometimes reveal when the illusive thoughts are being entangled to a halt.
 It was asked: "Does a cypress tree have Buddha nature or not?" The master (Zhaozhou) replied: "Yes." "When will it become a Buddha?" The master said: "When emptiness falls onto the ground." "When does emptiness fall onto the ground?" The master replied: "When the cypress tree becomes a Buddha."
3. *Bypassing the illusive thought barrier by forcing the illusive mind with no way to turn*
 Chan masters are commonly known to hit their students for 30 sticks for a yes answer and yet gain 30 sticks for a no answer to a question. By creating impossible positions on either side, Chan master forces the student to forsake the conceptual mind already defiled by illusive thoughts and passes into the non-illusive mind, which is the enlightened mind. Master Guishan once was given a test, his master Baizhang pointed to a cleaning vase and asked, "Do not call it a cleaning vase, what would you call it as?" Guishan kicked off the cleaning vase and went out. He received the confirmation.
4. *An apparent irrelevant or illogical answer that helps stop the illusive mind*
 Chan gongans (koans) are known to be full of irrelevant or illogical statements. The function of many such absurdity or nonsense is to make the illusive mind impossible to carry out its thought process and being forced to stop, which gives a chance for the nondiscursive enlightenment mind to reveal.

A student asked, “What is Buddha?” Master (Zhaozhou): “That inside the sanctuary.” “Isn’t that inside the sanctuary a clay statue?” Master said, “Yes.” Student: “What is Buddha?” Master said, “That inside the sanctuary.”

Eventually, the querying of such puzzle had itself developed into a method of practice known as “cangongan” (querying a public enlightenment case) or “canhautou” (querying a phrase of an enlightenment case). A very popular method of gongan or hautou derives from the following gongan of Zhaozhou. It developed into the popular gongan method of querying “Why does dog have no Buddha nature?”

A student asked, “Does dog has Buddha nature or not?” Master said, “No.”

5. *Directing the mind from conceptual reasoning to nonconceptual insight*

Ordinary people’s conceptual thinking is defiled by illusive and discursive thoughts. It is not useful as a direct means to approach the non-illusive enlightened mind. Thus, non-conceptual insight is often adopted by Chan masters to help bypass the illusive thoughts into the non-illusive enlightened mind.

Accordingly, masters had adopted methods that are speechless but requires insight such as turning into complete silence, raising or lowering the master’s stick, walking from east to west or vice versa, presenting a symbol of a circle, raising the eyebrow or blinking the eyes, and calling the name of the student. When these symbolisms are used in a suitable context, they may elicit insight from the student that resonates with the nature of enlightenment. An example:

Yunyan came to seek advice, Master (Guizhong) showed the gesture of drawing a bow. Yan was motionless for a while and acted the gesture of drawing a sword. Master said, “It happened all too late.”

6. *Pointing out the misapplication of the student’s mind while seeking enlightenment*

Chan masters often point out the wrong direction or assumptions of the student’s

application of their mind in seeking enlightenment. When the student stops looking or going into the wrong direction, they may have a chance to encounter directly enlightenment in the appropriate application of the mind.

For example, a monk asked Master Yuanmen: “Not giving rise to one thought, is there still any fault or not?” The master said: “Mount Xumi!”

Mount Xumi, an extremely enormous legendary mountain in Buddhist literature, here refers to the extremely wrong position of equating enlightenment with complete dispense of thoughts, logic, or conceptual thinking. Enlightenment is the purification of the mind from illusive or discursive thoughts, not to arrive at a mind that cannot think.

A monk asked, “How is the state of quiescence with no reliance?” Master Xuefeng Yicun: “It is sickness still.” “What becomes of after turning?” Master: “A ship down Yangzhou.”

The state of quiescence with no reliance seems to be the meditative state with no discursiveness or concentration effort. This initial enlightenment experience is still sickness compared to great enlightenment, when enlightenment is completely self-sustained with completely no meditation or contemplation effort and when the mind can be vigorously functioning with no fixation and simultaneously without any discursiveness, likened to the ship that flows freely down toward the city of Yangzhou.

7. *Direct symbolic representation of the enlightenment realm*

Chan gongans are filled with symbolic representations of the enlightenment realm spoken by various Chan Masters. Because enlightenment cognition contains simultaneously unification and differentiation, it is often not describable clearly in ordinary dualistically opposed logic or conceptualization. Symbolic representations are often used to express (1) the internal state of the enlightenment mind with regard to no illusive thoughts and (2) the

enlightenment cognition of simultaneously unification and differentiation, which can be used to stimulate and induce insight from the students.

When the states of mind of the Chan students are close to the said symbolic representations, a resonance can occur that reveals the enlightenment mind and that becomes an enlightenment experience.

Example of representation (1) is “A sunny sky without a cloud in ten thousand miles” and (2) is like “Holding a plough with empty hand, riding an ox while walking; Man walks across the bridge, the bridge flows without water flowing.”

8. *Display of speech and action in congruence with Buddhadharma truth, e.g., Middle Way or nonattachment*

Chan masters display Buddhadharma truth, such as Middle Way position or non-attachment, through their speech or actions. Middle Way position refers to the non-attachment of either the form or emptiness of things. Such speech and action coming from an enlightened mind can sometimes resonate and awaken another near-enlightened mind if that is about ripe. Examples of the Middle Way and nonattachment positions are listed as follow:

There is a gongan about an old practitioner believed to be a transformation of a fairy wild fox, came to Master Baizhang to receive instruction about the question of whether a great practitioner would fall into cause and effect or not. Baizhang replied, “Obscure not cause and effect!” By this the wild fox appeared and was transmigrated and liberated.

Patriarch Huineng was asked who could get the rope and bowl from Bodhidharma. Huineng replied, “Who he knows Buddhadharma can get it.” And the question followed, “Do you know Buddhadharma or not?” Huineng said, “I don’t know Buddhadharma.”

9. *De-attachment of Buddhism and the Chan Master*

The vital theme declared by Buddha for liberation of suffering is de-attachment. The

religion of Buddhism requires not only the de-attachment to the worldly cravings but also to the religion of Buddhism and the religious master in order to gain ultimate liberation. Thus, in Chan there are often themes about renouncing the Buddhist principles and the upsetting of the master by the student. A popular Chan saying says, “With seeing self-nature the Buddha remains not; in great enlightenment the Master exists not.” There are cases about burning a wooden Buddha statue to keep warm and the hitting back to his master by Linji. Chan master can also purposely create a situation for de-attaching the student’s residual attachments to Buddhism and the master so that the student can attain ultimate liberation.

For example, when his student Lingxun was about to graduate, Master Guizhong asked him to come to receive the teaching of the supreme Buddhadharma. Guizhong told Lingxun to come closer and he went closer. Guizhong said, “Season’s cold, take good care of your journey.” When Lingxun heard upon this, he forgot at once his previous (intellectual) understanding.

Enneagram

Christopher Kam
Counselling and Spirituality, Saint Paul
University, Ottawa, ON, Canada

The Origins of the Enneagram

The Enneagram is a personality framework of nine fundamental personality archetypes and their interrelationships.

It integrates spiritual wisdom from various ancient spiritual traditions such as Christianity, Buddhism, the Sufi sect of Islam, and Cabbalism with concepts of modern psychology (Riso and Hudson 1999). Although its exact origins are somewhat vague, scholars conjecture that its roots likely come from as early as the fourth century from early monasticism with the Desert Fathers (Rohr and Ebert 2001). Three key individuals in the twentieth century were responsible for bringing it into the West in its culturally intelligible form – G. I. Gurdjieff in Russia and Europe in the early 1900s, Oscar Ichazo in Chile in the 1960s, and Claudio Naranjo in Berkeley, California, after studying with Ichazo in 1970 (Chestnut 2013).

Gurdjieff traveled extensively in the Middle East, Asia, Egypt, and North Africa to learn

about human nature from multiple secret societies and hermetic organizations that were political, mystical, religious, philosophical, and occultic in nature. His main contribution to the Enneagram in its modern form was his perspective that each personality type has a “chief feature,” also known as a “passion,” which is central to the operation of its personality (Chestnut 2013). He believed that humans hide their negative traits from themselves through an elaborate system of internal defense mechanisms that blind them to forces within their personality. As a result, a person cannot see who they really are since their perceptions have been distorted deeply from within (Palmer 1988).

Ichazo referred to Aristotle and Neoplatonism as sources of his influence and was known to be formed by his studies in the far East, especially from Afghanistan. The nine personality types that he transposed on the modern Enneagram symbol originated from ancient spiritual traditions that saw nine divine attributes as they were seen as reflected in human nature (Riso and Hudson 1999). He taught the Enneagram of “fixations” which referred to a group of psychological traits in individuals resulting from some early injury to the psyche which resulted in a corresponding psychic compensation. These lopsided preoccupations end up being the points where one’s psyche has been disproportionately predisposed or focused on based on a sense of lack. Over time, these fixations become mechanical, escape conscious awareness, and come to define a personality type (Chestnut 2013).

Naranjo, a Chilean psychiatrist, developed the Enneagram further by articulating it through existing psychological nomenclature and spiritual approaches to self-development. With his background in psychoanalytic psychology, existential therapies, Karen Horney’s personality theory, Sufism, and Buddhist meditation, he used the Enneagram as a tool to integrate trends in Western psychology and Eastern spiritual practices to help people understand their patterns and habits for the purpose of transcending them (Chestnut 2013).

Philosophical Presuppositions of the Enneagram

According to its classical assumptions, the Enneagram sees each individual having an “Essence,” which is a spark of the divine inside of oneself. Each Enneagram type is a reflection of one aspect of the personality of the divine (Kam 2018). This represents one’s “Essential Self” which has largely been forgotten due to having one’s attention dominated by the developed personality starting from childhood and well into adulthood. This loss of our Essence, which is also known as the “True Self,” leads to unconscious mental fixations and “passions,” the latter of which are unconscious themes of emotional suffering. Both end up unconsciously motivating the person. The Enneagram is a map to help humans remember the truth of their essential spiritual nature and how they have limited their perception of themselves (Riso and Hudson 1999). As a result of losing connection with one’s Essential Self, each of the nine types has a Basic Fear that deeply drives them without their self-awareness. Driven by a type’s Basic Fear, the type’s unconscious defense mechanisms compensate for the hurts experienced in childhood. As these defenses become more structured, they cause a person to increasingly lose connection with their direct experience of themselves, namely, their Essence, as they increasingly focus on their acquired personality. The end result is that an individual is asleep to their deepest motivations and that their perceptions are distorted by their psychological defenses (Palmer 1988). This leads to a misguided drive to re-experience one’s original being of Essence through pursuing a self-deceptive substitution of it (Naranjo 1994).

The central message of the Enneagram is to observe and reflect upon one’s experience through the development of an “inner witness” or “inner observer” to help one acquire greater self-knowledge (Chestnut 2013). This, in turn, will help create the possibility of a higher consciousness that transcends one’s automatic and self-limiting unconscious habits in thinking, feeling, and acting. By understanding the acquired personality through self-reflection, one has

the potential to become transformed as one increasingly gets in touch with one’s unconscious wounds and its attempted compensations and, in turn, transcends them.

In one’s Enneagram journey, the aim is not to rid oneself of one’s personality. It is to become less identified with it so that a deeper part of oneself, one’s Essential nature, can arise and transform the person (Riso and Hudson 1999). The more one notices the automatic reactions of one’s personality type, the more one can loosen one’s unconscious fixation and find freedom from one’s passion. One grows as one frees oneself from the self-limiting habits of thinking, feeling, and acting. The awareness is expanded and can then grow beyond the type’s preoccupations and instead embody a higher consciousness (Palmer 1988). As a result, the personality becomes a smaller part of a person’s total way of viewing themselves, and one’s Essence begins to manifest more fully. As this happens, one develops greater freedom, balance, and wholeness with one’s higher self (Chestnut 2013). There are conceptual relationships between the levels of consciousness in the growth of one’s Enneagram type and the empirically established levels of psychological development according to Jane Loevinger’s adult ego development model (Daniels et al. 2018).

Outline of the Enneagram Framework

“Enneagram” literally means “9-points” in Greek (“Ennea” – 9, “grammos” = points) (Palmer 1988). The Enneagram consists of a symbolic diagram that is comprised of a circle where nine personality types are evenly placed around the circumference. Each type’s personality patterns can be heavily influenced by either one or two adjacent numbers which are called “wings.” This model has 3 centers of intelligence (mind, body, heart) as well as 27 “subtypes” (3 for each of the 9 types where one can be predominantly motivated by an instinct of either self-preservation, social interaction, or sexual/one-on-one bonding). A main idea of the entire model is that each permutation of personality within the framework

is based on patterns (Chestnut 2013). Each type has a perceptual filter which determines what one pays attention to and how one directs one's energy. The nine types each have an underlying basic proposition or belief about what one needs for survival and satisfaction (Daniels and Price 2000). There are a range of possibilities for each type's level of functioning. One can have a lower level of functioning consisting of more fixated aspects of the type's personality and ego that result in more constriction, rigidity, and automatic living, whereas higher aspects of the type's expression emerge when the fixated aspects of the type can be more loosened, free, and transcended as one is more in touch with one's Essential nature (Chestnut 2013; Riso and Hudson 1999) (Table 1).

At the center of each type lies an underlying cognitive bias, a "fixation," and a motivation driven by an unconscious feeling of lacking something, which is a "passion" that carries a misguided attitude that attempts to reconnect oneself with one's Essential being (Naranjo 1994). A type's passion is sustained by that type's distorted cognitive fixation and is based on an implicit view of what that type needs to survive and how one can attempt to meet that basic need which never seems to get fulfilled (Chestnut 2013). These both combine to form a diminished awareness and prevent one from experiencing the type's original Essence

connected to the divine. As a result of this "meta-physical illusion," which is a false assumption with regard to its True and Essential Self, one develops a Basic Fear that drives a Basic Desire in each type, which ends up being what the ego continually strives after (Naranjo 1994; Riso and Hudson 1999).

As one disidentifies from one's personality through self-observation, consciously surrenders the type's fear, and confronts the type's fear and confronting the type's unconscious theme of emotional suffering, one rises from the limited purview of the ego's acquired personality and experiences a higher consciousness and sense of wholeness (Chestnut 2013). By loosening the ego's defenses, fixations, and reactional habits, liberation occurs to the degree that one no longer unconsciously identifies with the ego's personality (Riso and Hudson 1999). This consists of the person relinquishing their deficient self-image of being disconnected from their Essential Self which originally motivated the type's fixations and passions (Table 2).

As an individual experiences higher forms of consciousness in one's Enneagram journey, the person will experience more of their type's corresponding holy ideas and virtues. Holy ideas of each type are the mental clarity and higher quality of mind that are experienced as one is at rest with one's True Self. The virtue of each type is the antidote of each type's passion and

Enneagram, Table 1 Unconscious foci of attention, habitual thought patterns, and blind spots of the Enneagram types. (Arthur 2008; adapted from Palmer 1988; Palmer and Brown 1997)

Enneagram type	Core emotion	Focus of attention	Habitual thought pattern	Blind spot
One/perfectionist	Anger	Error	Resentment	Shades of gray
Two/giver	Pride	Other people's needs	Flattery	Own needs
Three/performer	Deceit	Success	Vanity	Failure
Four/romantic	Envy	What's missing	Melancholy	What's good in the present
Five/observer	Avarice	Intrusion	Detachment	Present abundance
Six/trooper	Fear	Hazard	Doubt	Actual power of authority
Seven/epicure	Gluttony	Pleasant future possibilities	Planning	Actual limitations
Eight/protector	Lust	Power	Vengeance	Impact on others
Nine/mediator	Sloth	Other people's agendas	Self-forgetting	Own agenda

Enneagram, Table 2 Fixations, passions, holy ideas, and virtues of the Enneagram types. (Adapted from Chestnut 2013; Heuertz 2017; Palmer 1988)

Enneagram type	Fixation	Passion	Holy idea	Virtue
One	Resentment	Anger	Holy perfection	Serenity
Two	Flattery	Pride	Holy will	Humility
Three	Vanity	Deceit	Holy harmony	Authenticity
Four	Melancholy	Envy	Holy origin	Equanimity
Five	Stinginess	Avarice	Holy transparency	Nonattachment
Six	Cowardice	Fear	Holy strength	Courage
Seven	Planning	Gluttony	Holy wisdom	Sobriety
Eight	Vengeance	Lust	Holy truth	Innocence
Nine	Indolence	Sloth	Holy love	Action

consists of emotional objectivity of the higher True Self that comes forward when the person is more present to oneself with more peace (Chestnut 2013; Heuertz 2017; Palmer 1988).

Entheogens

Katie Givens Kime
Institute of Practical Theology, University of
Bern, Bern, Switzerland

Entheogen is a term coined in the late 1970s by a group of botanists and scholars which refers to any psychoactive agent which allows for “generating the divine within” (Ruck et al. 1979). Entheogens are psychedelic substances which, in adequate dosage under supportive conditions, are known to facilitate visionary, mystical, and/or spiritual experiences. Such substances include psilocybin, peyote, LSD (lysergic acid diethylamide), ibogaine, and ayahuasca. Typically of plant origin, entheogens are often called “psychedelics” or more commonly in medical

communities “hallucinogens.” Many argue this term is a misnomer, given the exceedingly rare occurrence of true hallucinations with such substances (Richards 2015).

The relationship between psychoactive substances and religious experiences extends far into human history and across cultures and religious traditions. Entheogens may be the oldest class of psychopharmacological agents known to humanity (Nichols 2016: 268). Throughout the Rigveda, a canonical sacred text of Hinduism, the hallucinogenic substance known as *Soma* is frequently praised. In ancient Greece, a hallucinogenic brew called *kykeon* was ingested as part of the Eleusinian Mystery traditions. In what is now Mexico and the southwest USA, indigenous religious communities have made ritual use of the psychoactive peyote cactus for more than 5000 years, according to archaeological and anthropological records. In both Mesoamerican and Australian cultures, psilocybin mushrooms were used for healing and religious rituals. In Aztec communities, such mushrooms were known as *teonanacatl*, meaning “god’s flesh.” In indigenous Amazonian communities of South America, a hallucinogenic plant decoction known as *ayahuasca*, which contains DMT (*N,N*-dimethyltryptamine, a naturally occurring psychoactive molecule, also called “the spirit molecule”), is used for sacred ritual purposes.

The Western modern era of psychedelics began in Switzerland in 1943, when chemist Alfred Hofmann synthesized a compound he dubbed LSD-25. In the record of his self-experiment, he first experienced “a not unpleasant intoxicated-like condition, characterized by an extremely stimulated imagination. In a dreamlike state, with eyes closed. . . I perceived an uninterrupted stream of fantastic pictures, extraordinary shapes with intense, kaleidoscopic play of colors.” (Hofmann 1979: 15). Intense anxiety and paranoia followed: to Hofmann, his next-door neighbor suddenly seemed to be a “malevolent, insidious witch with a coloured mask,” and he sensed a “disintegration of the outer world and the dissolution of my ego. . . A demon had invaded me, had taken possession of my body, mind and soul. . . I was seized by a dreadful fear of going insane” (17–18).

Curiously, Hofmann then experienced notably positive sensations. “Exhausted, I then slept, to awake next morning refreshed, with a clear head, though still somewhat tired physically. A sensation of well-being and renewed life flowed through me. Breakfast tasted delicious and gave me extraordinary pleasure. When I later walked out into the garden, in which the sun shone now after a spring rain, everything glistened and sparkled in a fresh light. The world was as if newly created. All my senses vibrated in a condition of highest sensitivity, which persisted for the entire day” (19). Hofmann’s account recalls William James’ now classic retrospective evaluation of his nitrous oxide experience, in which he concluded, “our normal waking consciousness, rational consciousness as we call it, is but one special type of consciousness” and that “Looking back on my own experiences, they all converge toward a kind of insight to which I cannot help ascribing some metaphysical significance” (1902: 308).

In the 1950s, following Hofmann’s discovery, many European and American scholars and psychiatrists eagerly explored the clinical and existential potential for what might be a new “royal road to the unconscious.” Patients struggling with addiction, depression, autism, and schizophrenia were given doses of LSD (then marketed by Sandoz Laboratories as Delysid), as were terminally ill cancer patients, healthy artists, scientists, and divinity students. In this period, more than a thousand clinical papers were produced, discussing more than 40,000 patients (Grinspoon and Bakalar 1979: 192). Research pioneers of this era concluded that LSD, psilocybin, and similarly psychoactive agents reliably induced altered states of perception, of “portentousness,” in which the mind sees and experiences more than it can explicate or rationalize, in modes not experienced outside of dreams or “times of religious exhilaration” (Nichols 2016: 269). The exploratory and clinical use of LSD and of plant-based entheogens, like mescaline and psilocybin, gained national attention, as did the recreational use of LSD and related psychedelic substances. By 1960, the controversial Harvard Psilocybin Project had been founded by Dr. Timothy Leary and Dr. Richard Alpert, in which psilocybin was

administered to graduate students and prison inmates in order to discover whether or not profound religious states could be occasioned by the drug.

In this context, one of the most (in)famous experiments in the history of the psychology of religion was conducted: the 1962 “Good Friday Experiment,” also called the “Marsh Chapel Experiment.” While Howard Thurman preached on the last words of Christ in Marsh Chapel at Boston University, the clinical study took place in the basement sanctuary, directly below the pulpit. Twenty seminarians participated in a double-blind study designed by Walter Pahnke, an ordained minister and physician completing his doctoral work at Harvard University. Eight of the 10 who received psilocybin reported dramatic mystical experiences, and some reportedly wandered about the chapel crying aloud, “God is everywhere” and “Oh, the glory!” Only one of the 10 control group (who were given nicotinic acid as an active placebo) participants experienced elevated mystical feelings. For scholars of religion, perhaps the most notable participant in the Good Friday Experiment was Huston Smith, the foremost twentieth-century scholar of comparative world religions, who referred to his psilocybin experience that day as his “cosmic rebirth.” Despite incomplete reporting of anxiety and other negative experiences, the study was significant in demonstrating the potential of entheogens in triggering mystical experiences.

By the mid- and late 1960s, the “psychedelic era,” birthed within the US youth counter-culture included the recreational and exploitative use of entheogens. Psychedelic drug use became embedded in – and even blamed for – complex sociopolitical upheaval of the time. In 1970, the US federal government banned nearly all psychedelic substances, suppressing all research and clinical use. The Controlled Substances Act, initiated by then-President Nixon, regulated psychedelic substances to the maximally restrictive category of Schedule I, along with narcotics such as heroin, citing “high potential for abuse” and “no currently accepted medical use.” The all-encompassing federal research bans on entheogens marked an unprecedented level of taboo in modern science

(Pollan 2015), a product of various cultural fears and political agendas.

By the late 1990s, US researchers met some success in easing federal regulations. In 2006, psychopharmacologist Roland Griffiths and his colleagues at Johns Hopkins University School of Medicine published the results of their breakthrough trial, an extension of the Good Friday Experiment. In the double-blind clinical method, 22 of the 36 study participants (all healthy volunteers) reported dramatic mystical experiences after psilocybin sessions, compared with only four following placebo sessions. Griffiths concluded, “when administered to volunteers under supportive conditions, psilocybin occasioned experiences similar to spontaneously occurring mystical experiences and which were evaluated by volunteers as having substantial and sustained personal meaning and spiritual significance” (282). The tentative but highly promising success of Griffiths’ study led to several other clinical trials.

Currently, US clinical investigation of the therapeutic uses of entheogens is limited mostly to psilocybin, avoiding the social stigma of LSD, which is being studied in Switzerland and the UK Treatment-resistant major depressive disorder, alcohol dependence, obsessive-compulsive disorder, tobacco addiction, and existential distress associated with terminal illness (palliative care) are all focus treatment areas for recent and ongoing clinical trials (Thomas et al. 2017). Across this broad range of disorders and diagnoses, the physiological and psychological reasons for the success of entheogen-related treatment are widely varying, and any consensus within the medical community on these matters remains preliminary and tentative, at best. Investigators broadly agree however that the often dramatic positive findings thus far support the value of continued research.

Disagreement arises around the reasons for the healing potential of entheogens. Many believe that improvement of symptoms “must be related to neurochemical effects, or neuroadaptation, and refuse to believe that the mystical experience may be relevant” (Nichols 2016: 344). Others are curious to understand how entheogens seem to trigger

such highly meaningful experiences, and why reportedly mystical experiences are of particular help to several psychiatric disorders.

Scholars of religion may find a particular pair of clinical trials to be noteworthy. The NYU School of Medicine and Johns Hopkins School of Medicine are separately recruiting participants to investigate “The Effects of Psilocybin-Facilitated Experience on the Psychology and Effectiveness of Religious Professionals.” The trials are premised on the hypothesis that professional leaders of religious communities, “given their interests, training, and life experience, will be able to make nuanced discriminations of their psilocybin experiences, thus contributing to the scientific understanding of mystical-type experience” (Ross 2018).

The controversy and high drama of the Good Friday Experiment may be contrasted with scenes from psilocybin therapy sessions today at Johns Hopkins School of Medicine, New York University, and the University of California in Los Angeles, which usually include a well-appointed room, decorated with books and art representing various myths and religious traditions, a comfortable couch-bed for participants, with headphones and an eye mask. In many such contexts, patients are given a single pill, either a placebo or dose of psilocybin, from a ceramic chalice. Two clinicians (usually male and female) attend the participant for the entire session, which averages about 8 h in duration. Written personal narrative, strictly required by all study participants in the 24 h following their psilocybin therapy session, plays a critical role in the study, as do William James’ four marks of mysticism (ineffability, noesis, transiency, and passivity), via the six-category Pahnke-Richards Mystical Experience Questionnaire, which is utilized in several of the US clinical methodologies.

In discussions regarding the recent findings, researchers note the remarkable similarities across participant accounts. In addition to the expected experiences of altered senses of time, space, and self, participants tend to value the experience as one of the most important and authoritative events of their lives, in follow-up studies years later (Griffiths et al. 2006). Individuals frequently

note frustration when tasked with describing their sensations and insights, given the ineffability of their experiences.

Besides the promising potential for continued research into the beneficial effects of entheogens, the relationship between psychoactive drugs and mystical experience provokes a return to old questions. Within the psychology of religion, what meaning do we make about the nature of entheogens? Ralph W. Hood, Jr., points out the “question of veridicality” that continues to accompany “chemically facilitated mysticism.” What does it mean to take a pill to induce a mystical experience – is it still authentic? Are patients glimpsing other dimensions of reality? Does the noetic quality of the induced mystical experiences point us to something “more” than just the consequences, mechanisms, and architecture of the mind?

Epiphany

Kelly Murphy Mason
Psychotherapy and Spirituality Institute,
New York, NY, USA

Epiphany is the ecclesiastical feast that falls 12 days after Christmas. It marks the arrival of the Magi in Bethlehem to behold the Christ child; it also marks the end of Christmastide. The weeks following it that lead up to Lent are called Epiphany season, which has a variable length in the liturgical calendar. Etymologically, epiphany is derived from the Greek term for “manifestation.” The holiday was originally celebrated by the

Eastern Church, to commemorate the angelic announcement of the good news of Christ’s birth, but later focused more on Christ’s baptism. The Nativity came to be understood as one instance of Theophany, a showing forth of God. Accounts vary between the Gospels of Matthew and Luke, the only two gospels to include Jesus’ birth narrative, but in each, people are immediately led to understand the momentous import of the birth: “Glory to God in the highest heaven and peace on earth and God’s favor to men” (Lk 2:14). Much later, epiphany was used generically to describe instantaneous insight; it was a frequent literary device in modern English literature, where it usually featured as a formative experience in a character’s development. For the purposes of psychology, an epiphany signals a breakthrough that allows a person to apprehend something more fully than before. It has an almost mystical quality to it, an intuitive veracity.

Erikson, Erik

Lynn Somerstein
Institute for Expressive Analysis, New York, NY,
USA

Erik Erikson (1902–1994) was a developmental psychologist and psychoanalyst whose theory presaged Ego Psychology and Interpersonal theories of psychology as well. Erikson emphasized the interaction between the individual and society,

placing great importance on the positive influence that religious and cultural values exert on individual development. Religion and its associated rituals provide a pattern, goal, and ideal for the individual life cycle. In his view, a religious life is part of the successful, healthy development of the individual and begins during the stage of basic trust, when faith has its start. Erikson writes, in *Young Man Luther*, “One basic task of all religions is to reaffirm that first relationship” (1958, pp. 118–119).

His early life was difficult. He was born out of wedlock and raised by his mother as a single parent until she married his pediatrician Dr. Theodore Homburger. It is believed that Erikson’s real father was a Gentile, but Dr. Homburger and Erik’s mother, Karla Abrahamsen, were Jewish and led an active religious life together with their family. Although Dr. Homburger eventually adopted Erik, he was not able to convey his total emotional acceptance to Erik as his son.

Identity was an important personal question for Erikson. He never learned who his real father was, but he believed that he looked like him. Erikson was tall and blond. He was criticized for looking like a Gentile when he was in Synagogue and for being a Jew when he was in school, so he effectively did not fit in anywhere. He solved some of his identity conflict when he became a Christian after his marriage to Joan Serson, whose father was a minister. His confusion about who he was and where he had come from may lie at the bottom of his belief that the “identity crisis” is a normal event.

He is also famous for his Epigenetic Theory, which uses the stages of fetal development as a template for personality development. Successful passage through the early stages of his Epigenetic Theory yields later success, but problems that begin early ineluctably affect later development. The stages and their associated tasks are as follows:

- *Stage one:* Oral-sensory: from birth to one, trust vs. mistrust, feeding
- *Stage two:* Muscular-anal: 1–3 years, autonomy vs. doubt, toilet training

- *Stage three:* Locomotor: 3–6 years, initiative vs. inadequacy, independence
- *Stage four:* Latency: 6–12 years, industry vs. inferiority, school
- *Stage five:* Adolescence: 12–18 years, identity vs. confusion, peer relationships
- *Stage six:* Young adulthood: 18–40 years, intimacy vs. isolation, love relationships
- *Stage seven:* Middle adulthood: 40–65 years, generativity vs. stagnation, parenting
- *Stage eight:* Maturity: 65 years until death, integrity vs. despair, acceptance of one’s life

His most important published works are:

Erikson, Erik's Life Cycle Theory and Religion

Joseph M. Kramp
John Jay College, New York, NY, USA

Religion and the life cycle is an area of scholarship in psychology and religion, built upon the work of Erik H. Erikson. Erikson, who studied under Anna Freud, developed life cycle theory in his first major book, *Childhood and Society* (1950). Erikson's interests in the human life cycle always coexisted with his interests in religion and human values because Erikson assigned attending virtues to each psychosocial stage of development. Erikson's understanding of the way in which individuals managed to acquire these virtues factored into his understanding of how social values are transformed and how leaders rise to prominence out of strenuous psychological conflict and struggle. In this sense, Erikson makes it very difficult to talk of the human life cycle without also critically analyzing the role of religion in the stages of psychosocial development. Religion becomes a critical term of analysis in life cycle theory at each epigenetic stage, beginning with the first.

For Erikson, the child's basic trust is formed in the maternal presence, though the formation of basic trust does not depend upon a total absence of frustration. Erikson describes the child's interactions with the mother as ritualized and the infant's first experience of a numinous presence. The infant has, thus, a need to be seen, to see and respond, and then to be responded to. This process, for Erikson, is saturated with religious connotations and forms the basis for future religious and psychological development. Idealization or positive projection is therefore a critical component to Erikson's psychology of religion and his understanding of religion in the human life cycle. Positive projection (along with Erikson's psychosocial stages) differentiates Erikson's emphasis and understanding of religion from Sigmund Freud. Religion at its best is, for Erikson, a sense of basic trust.

The development of basic trust undergirds the acquisition of the first life cycle virtue that Erikson assigns that of hope. In later writings, such as Erikson's (1959) *Young Man Luther*, a psychological biography of the German Roman Catholic monk Martin Luther, Erikson would discuss the role of the virtues such as hope in Luther's developing religious and psychological life. Biography and historical study would, therefore, become a means for Erikson to analyze how the epigenetic life cycle interacted with religious beliefs and behaviors over the course of a lifetime. Erikson would typically choose famous religious leaders for such studies (e.g., Luther and Gandhi), though he would also use other less well-known and less ostensibly religious figures as well, such as George Bernard Shaw and William James.

As the child's sphere of interest and influence grows, the psychosocial or life cycle crises expand to include a broader set of peers and social goals to be accomplished. In the second stage, for example, the radius of significant persons is both parents or any kind of parental guide. At this stage, the virtue to be acquired is will. While hope provides the individual with the belief that one's wishes are attainable (sometimes religiously articulated as believing God will provide), will

provides the individual with added strength to assert one's own wishes in spite of the control exercised by authority. Will is, in this sense, built off of hope.

In the third and fourth stages, the virtues of purpose and competence are ideally acquired. These virtues, as with hope and will, have religious connotations to them. While hope and will are tied to the strength and discretion one acquires in idealizing and action, purpose and competence are tightly aligned with beginning to experience meaning in one's actions and decisions. These begin at play age but extend throughout adulthood. Play is, in this sense, the precursor to adult forms of work. Thus, work is – for Erikson – an intrinsically religious activity so long as the virtues are what support it, even if it is done in an ostensibly secular setting. An airplane pilot, for example, who never prays and self-identifies as an atheist, but who finds her or his work deeply meaningful and has gone through a long process of training and discernment of why such action is meaningful for him or her, is living out a deeply religious action in their style of work. While it would be important, in this and all cases, to respect the unique religious designation (in this case, atheist), religious behavior in life cycle theory connotes not only idealizing behaviors but also intentional patterns, moods of reverence and awe, and the unique meaning an individual assigns to actions taken or interpreted.

As the individual moves through the stages, the adolescent period is a particularly significant one for understanding religion and the life cycle. While the adolescent is initiated into various social clubs and groups, the adolescent is in desperate need of acquiring a worldview or guiding ideology. The adolescent sometimes looks to religion for this, as in the case of Luther, but might also look to more secular behaviors or teachings, as described by someone like William James. This successful acquisition of an ideology provides the basis for the adolescent's success at the life cycle crisis of identity versus identity confusion and determines their transition into a social and working role in society. This stage is particularly

important for understanding the role of religion in the life cycle because the adolescent may find a way to use religion in order to critique the social roles prepared for the adolescent to accept. Such countercultural behavior deeply interested Erikson and formed the basis of his psychohistorical methodology, which he applied in his studies on Luther (Erikson 1959) and Gandhi (Erikson 1969). For Erikson, such struggling adolescents have particularly unique psychosocial crises that, when the individual articulates them, their crises become commonly understood by large groups of people and they therefore form the basis of social reform movements, such as the Protestant Reformation.

Such adolescents also can take the better part of a lifetime to find their work role in society and resolve the intimacy vs. isolation crisis, as well as other life cycle crises. As a result, Erikson understands adolescence in terms of life cycle development. Adulthood is only reached when the individual assumes a personally meaningful social role, informed by successful completion of the early stages where meaning and action are aligned. Writings on religion and the life cycle, when focused on an individual, are therefore often revealing of an ersatz adulthood, falsely simulated by an aging population who have failed in the critical life cycle stages leading up to adulthood and therefore mocks the weighty and significant role that adults play in the life cycle schema. Such significance attached to adult responsibility reveals the religious sensibilities and commitments Erikson linked to life cycle stages.

Love, care, and wisdom form the last three virtues Erikson assigned to the latter life cycle stages. Such virtues form the basis of social cohesion and empathy, which Erikson believed was what provided an answer to cultural relativism, individual uniqueness, and oppressive social forces. Integrity of one's identity is, therefore, the ultimate aim of the life cycle in the midst of a complex and pluralistic social environment. Integrity of identity is an aim guided at each stage by acquisition of religious virtue in conjunction with psychosocial experience.

Eros

Kathryn Madden
National Institute for the Psychotherapies,
New York, NY, USA

Eros [Latin *Erōs*; Greek *ἔρως érōs*] refers to passionate love, sensual desire, and longing. In the personified form of Greek mythology ca. 1386, Eros was the god of love, related to desire of an unknown origin. In the early creation myth, the *Theogony* of Hesiod (700 BCE), Eros was a primal god, son of Chaos, the original primeval emptiness of the universe. Eros emerged from the primordial groundlessness of Chaos together with Gaia, the Earth, matter, and nature and Tartarus the underworld, creating a dichotomy of being. Some legends attribute Eros as the scintilla of desire that united Uranus (Heaven) and Gaia (Earth) from whose union the entire material world came into being. In early legends, he was the firstborn Light that was responsible for the fertile and creative coming into being and ordering of all things in the cosmos.

Later tradition depicted him as the son and attendant of Aphrodite, goddess of sexual love.

Together, as gods, they harnessed the primordial force of love and directed it into human beings. In Greek poetry, Eros was often portrayed as a willful, playful, charismatic, and often impish god. In later Greek thought, Eros as a primeval deity transformed into the one who embodied the compelling energies of erotic love as well as the urgent force of ever-flowing nature.

His Roman mythological counterpart was Cupid (Latin *cupido*), or Amor, meaning desire or love. In Roman literature and art, he became increasingly more youthful, eventually represented as the son and companion of Venus. Eros was portrayed as a handsome winged youth prepared to shoot into the heart of an unsuspecting victim with his bow and arrow. He carried two kinds of arrows: one was golden with dove feathers that caused instant love and the other was leaden with owl feathers and was purported to cause indifference in those it pierced.

In the early Greek and Roman civilizations, the phenomenon of love was commonly understood as a kind of madness from the gods that involved the sometimes reckless and careless aim of Eros' love arrows. His arrows were thought to not only pierce and wound the person's heart, overwhelming the individual with love at first sight, but often to promote the antithesis: pleasure accompanied by pain. The notion of passionate love at first sight was commonly believed to lead to unrequited love, impelling the lover into depression, pining, and sorrow.

Eros in Psychology

Eros was initially defined in Sigmund Freud's *Beyond the Pleasure Principle* (1920) as a life instinct, sexual drive, and unifying force. Eros referred further to the urge for self-preservation and the desire to create life and productive work. Freud conceptualized that all human beings undergo an instinctual dualism with Eros and Thanatos. Thanatos is the destructive force of the death instinct, the psychological polarity that can lead to the disintegration, dissolution, and

negation of all that exists. The underlying force beneath both energies is libido.

Analogous to Hesiod's notion of Eros emerging from the nothingness of Chaos, Freud posits that Eros is present in incarnation of matter out of inorganic material (Freud 1920, p. 61). Freud does not reference the work of Hesiod but demonstrates familiarity with the doctrine of the Greek physician and philosopher Empedocles of Agrigento (ca. 490–430 BCE), for whom the production of all things results from the interaction between two primary instincts: attraction and repulsion and love and conflict. Eros represents an increase in tension. With Thanatos, we find an eradication of all tensions. For Freud, the domination of libidinal Thanatos can result in neurosis, the propensity toward masochism, and suicidal tendencies. The domination of Eros fuels our sexuality and promotes creativity. Ideally, we strive toward a psychological balance between the interplay of these two energies.

Freud revised his drive theory over his years of psychoanalytic practice. Eros became a fundamental concept referring to the life instincts of narcissism. The immature ego is relegated to isolated self-love. The libido of the mature ego is directed toward object relations, connection, and relationship. Eros is rooted and has "aim" that takes psychological work to get at. As we become more aware of the aim, we experience something moving toward us and we may feel this something pulling us toward it. At first, the aim may appear as a desire for food, sex, a professional position, a published book, finding a partner, becoming pregnant, and becoming closer to God. Eros leads us beyond ourselves to connect with the aim or goal that is trying to become conscious. At the level of society, Eros leads toward kinship between individuals, groups, and nations.

Freud's theory of mature love implied "the all-inclusive and all-preserving Eros of Plato's *Symposium*" (Freud 1925, p. 218). Plato's concept of Eros included initial desires toward a person but also an aesthetic and reflective appreciation of the beauty within that person.

Eros and Carl Jung

Analytical psychologist, Carl Jung, understands Eros quite differently than Freud. Jung views libido as vital psychic energy that includes the body, sex, aggression, and also divine pneuma (spirit). More than our bodily desires, Eros has to do with our subjective being in a body and with something we must do before we die. Eros is full of sighs: sighs of relief, sighs of what we long to achieve, whom we wish to unite with or be closer to, as well as sighs of mourning.

Jung used the term *Eros* to represent his primary theory of feminine psychology, specifically the psychology of the anima or feminine soul. The anima (or animus as masculine soul) is the center of the archetype, a dominant image in the unconscious mind that varies for each of us. The anima or animus is a figure opposite to one's ego gender and position. Jung tells us it is an entry point to the deeper unconscious. The anima/animus is the mediator between the ego, the Self, the Self being the central archetype of the objective psyche. The Self is process and content, originator and goal of our psychological life. The experience of the Self for Jung is numinous and feels like a river flowing toward its source.

In contrast to Eros, Jung spoke of logos as the decisive principal ascribed to men. In modern culture, we could think of *Eros* as psychic relatedness and *logos* as objective interest (1959, CW X: 123, 255). In Jung's writings, he specifies gender in relation to these concepts, and yet, the feminine principle is relevant to men as well as women in terms of sexual identity. In fact, the notion of Eros of antiquity was revered by the name *Erotes*, the plural of Eros which pertained to all attractions that induced love and desire, whether heterosexual or homosexual attractions. More often for the Greeks, Eros was the benefactor of masculine enticements.

Drawing upon the legend of Eros and Psyche, Jung applied these two opposites to his theory of the anima/animus syzygy, or conjunction, of male and female psyches. Jungian theory claims that men possess the anima in their unconscious (images of the feminine soul, breathe,

inspiration). These are qualities and representations of the feminine *Eros*. Personal individuation, or the journey of integrative wholeness, requires male consciousness to confront their anima on many levels by accepting *Eros* not only at the projected ego level (i.e., the merely sexual and visceral object) but also by assimilating more mature layers of the feminine principle into conscious being.

Jungian analyst Eric Neumann explains the developmental integration of the anima in the legend of Cupid (*Eros*) and Psyche. The relationship of desire between Psyche and *Eros* begins in an uroboric state, as self-containment in which there is not yet individual unconsciousness. Psyche initiates an encounter with *Eros* and intentionally brings him into the light. Her act represents the undertaking of making the unconscious conscious. In this act, the unconscious bond between them is dissolved, transforming mere objective attraction to genuine love and promoting individuation – the ongoing incorporation of unconscious contents that occurs both in the development of the collective and the individual human being (Neumann 1956, p. 90).

Making the unconscious conscious has risks; yet, we need to bring our desires into consciousness. *Eros* wants to step over into visible life to be expressed. If *Eros* is not allowed to become visible and to incarnate, its energies will fasten onto any of a range of addictions or to a social cause that lacks the fullness of enfleshed foundations. *Eros* needs the body to express itself: through dance, art, music, writing, creative activity, and the love of children. Without such expression, we can fall into illness, somatization, or, on the religious side, fundamentalism or shallow and projective social justice righteousness.

Psychologically, *Eros* can lead us toward what is hiding in the lost parts of our selves that wants to be found that wishes to act out to become incarnate. In psychological practice, we track these lost parts of the self, regardless of school of thought, by paying attention to the desire inherent to *Eros* and not necessarily to its object. We study desire and where desire leads, observing what it ruthlessly seeks, acknowledging what object it is projected upon or images that it is

linked with. If we follow the red thread of *Eros*, we also may discover what object desires us.

At this juncture, we cross into the territory of religion or spirituality. *Eros* can be defined as desire in relation to spirit. Our personal desires and wishes collect around an obvious theme. If we pay attention to its movement and its images – its feeling tone and its colors – we take on a motif, a gathering together of something principle, a coloring. We begin to question who or what is pulling us toward this need for combining our energies, our self, our bodies, and our ideas, with another person, activity, or relationship.

Unfortunately, in the history of the Judeo-Christian tradition, biblical literature leaves the feminine presence of Sophia behind – a personified presence in the late Hebrew literature – and we find an increasingly exponential split between spirit and *Eros*. Instead, we find a predominantly male, rationalized emphasis upon the notion that somehow spirit is superior to desire when, in fact, prospective desire leads to spirit and spirit attracts desire. Inherent to an anagogical reading of scripture is the lavishing of the “first thing,” about God. *Eros*, then, is about having a passionate, all-out loving. In the biblical book of Hebrews, such loving is described as “fire.” *Eros* also flows into the biblical second commandment in that it underlies the efficacy of how social justice works. Otherwise, we just try to fix the world.

In the analytical arena, *Eros* as passion grows bigger because it comes into a fuller reality as it meets its opposite. What becomes evident and necessary for passionate love to break through is the prerequisite of a weak spot, a vulnerability in us. Something happens that shakes us loose from settled attitudes and creates a response that transforms vague longing into intense passion. The recognition may be so profound as to be ineffable and experienced as a gap or a void. Passion is the thrust that leaps across this abyss. Passionate love becomes so concentrated at the particular point where it strains against unknowing that it can break the defended barriers, ushering us into a new sphere of experience in which love is given and received. Received, it is returned in response, equaling an exchange. Such passion does not require knowledge and intellect, only willingness.

This process is one of self-giving, across a gap of unknowing toward an intensely desired wholeness (Haughton 1981, pp. 18–46, 58–61).

Wholeness links us with spirit and brings the body into the spirit. This fact is what distinguishes C. G. Jung's analytical psychology: we need desire and Eros to find God. God incarnates in the flesh of the psyche. We are innately possessed with the capacity to be conscious of the deity. When Eros aligns with the right object, this connection can link us to a life of relatedness. From Jung's view, depth psychology intends to point us toward religion as a container for the life of the unconscious.

The syzygy of anima and animus is an important factor in an individual's faith tradition because the images and affect that these images carry participate directly in the actual process of the transformation of the God image (Jaffe 1999, p. 25). Out of this inner marriage that Jung speaks of come images of the Self. Self-material is shared; it is not personal. There is a social aspect: if we do not share it, we lose it. Eros can breed a rich sense of interdependence in our work and in our communities, as if we are all connected. Eros as it bridges soul to spirit inevitably includes other people and constellates a "body" evoking us to ask: Is there a God? What is it that we love and that we are living for? What are we really summoned to? Are we living as a carbon copy of someone or something else, or are striving toward being an original? In order to answer these questions, we need to listen in the desert-place, the place of the still, small voice. We have to internally address any conflicting desires we find inside and to really grind down on the marrow to find what is addressing us.

In both psychology and religion, our goal is to pay close attention to this inner movement. How is Eros manifest? In our relationships, our groups, our communities, our creative projects? What does it ask of us? What Eros asks of us in relation to spirit often has to do with what the entirety of our mature lives will be about. First, however, we must find soul in relation to spirit. Jungian psychology offers a map for religion to follow in light of this transformation. We take what images we find under the authority of the psyche seriously,

follow the thread of Eros, and eventually find the meaning and intention of our individual lives. Then our desires lead us to the body and to the spirit and through the spirit to the body.

Eros, approached, amplified, and understood from the literal to the symbolic, without the negation of the bodily and the real can lead to the secret of transformation and renewal. From the perspective of religion, Eros has to do with the first commandment, putting the first things first and offering these things up to God. In our faith traditions and rituals, the giving of our desire and Eros is the giving of the most precious thing that identifies us as individuals. Transformation and wholeness requires of us that we sacrifice that which is most dear to us, offer it, give it up, and disidentify from *it*. We are yielding our ego-claims to the "beyond ego." Jung would say this is initiated by the Self. Something comes into our ego-neighborhood. We feel impelled by internal reasons.

As we offer up our desire, all the bits of ourselves begin to be collected and come into a more cohesive image. The Self too is changed, freed from unconscious projection into conscious focus. The Self sacrifices itself in the abstract to the ego. The unconscious Self becomes humanized just as the ego is spiritualized. Hence, the God image is transformed and changed, and we too are transformed by being taken into the center, the Self where we can live from. We can live from this center and the unconscious does not control us. In essence, if we pay attention to Eros, we arrive at where we belong.

Eschatology

Emily Stetler

Department of Theology, Mount St. Mary's University, Emmitsburg, MD, USA

The etymology of “eschatology” is ambiguous; the Greek root may be either *eschaton*, “end time,” or *eschata*, “final things.” Eschatology is more commonly described using the former understanding and thus defined as “the study of the end time.” In practice, though, eschatology encompasses the latter sense, as well. Particularly in Catholic theology, eschatology has traditionally been defined as being concerned with the so-called four last things: death, judgment, heaven, and hell. (To these four are sometimes added Purgatory and the resurrection of the body.)

Beyond this, though, eschatology also provides the venue for religions to speak of their *hope* both for the afterlife and for the here-and-now. Increasingly, eschatology also has come to imply a theology of history, as well.

As a theological field, eschatology covers a wide array of topics, for it is concerned with the

ultimate fate of the cosmos and of humankind. The unfolding of this drama varies widely, however, across and even within faith traditions. In general, though, two basic understandings of the eschaton exist: in one, the world comes to a culmination inherent in nature, and in other, the world ends violently, under assault by seemingly external or supernatural forces. The first is immanent, *within* history; the latter is an *escape* from history. This latter interpretation of eschatology is labeled *apocalyptic*. These distinctions are related, but not identical, to the further distinction between *realized* and *futuristic* eschatology. Futuristic eschatology looks toward fulfillment in some transformation – though not necessarily an apocalyptic one – at the end of time, whereas realized eschatology emphasizes that the present life has already been transformed through the sanctification of history.

A single faith can have both immanent and apocalyptic elements in its eschatology. For example, in Zoroastrianism, creation is oriented toward the *frashokereti*, the refreshment or renewal of the world, in which all is perfected; and devotees of the creator-god Ahura Mazda can precipitate this renewal through their actions. The prophet Zarathustra's emphasis on personal responsibility underscores that, through their own righteous behavior, individuals participate in the vanquishing of evil and restoration of the world to its right state. Ultimately, though, the final restoration must be accomplished by the divine himself; Ahura Mazda must enter into his creation from outside of it and direct the final battle against evil, a cosmic liturgy in which the evil principle Ahriman is banished to hell.

Indeed, violence, war, and disturbance of the natural world often characterize apocalyptic eschatology, as both Jewish and Christian apocalyptic narratives demonstrate. Yahweh tells the prophet Ezekiel that he will manipulate Gog, king of Magog, and cause him to invade Israel. God, in his anger, will rain down destructive fury: the earth will quake; mountains will crumble; the sky will rain fire and brimstone. The war and tumult will culminate in the destruction of God's enemies and the exaltation of Israel (Ezekiel 38:1–39:29).

In the New Testament, Jesus informs his disciples that, during the end times, there will be wars and natural disasters and the persecution of Jesus' followers; the Temple at Jerusalem will be desecrated. Following these things, the Son of Man – a title found in the prophets, as well – will return, accompanied by cosmic disturbances: the darkening of the sun and moon, falling stars. The angels will gather the peoples, and the Son of Man will sit in judgment (Matthew 24:4–25:46, Mark 13:5–37). John's vision, as recorded in the book of Revelation, also includes wars and heavenly signs, but the battle is much more explicitly one between good and evil, at the end of which Satan is ultimately consigned to a lake of burning fire, while Christ, his martyrs, saints, and church (portrayed as his bride) rejoice in heaven for all eternity.

Apocalyptic accounts also typically feature a heroic figure that marks the penultimate stage of the conflict between good and evil. In Zoroastrianism, it is the final *saoshyant* who restores peace before Ahura Mazda returns. In Islam, Jesus (Isa) returns to vanquish Dajjal, the anti-Christ. In Shi'a Islam, he is accompanied by the Madhi, the twelfth Imam, who went into occultation as a child to return at the end times. In Hinduism, Kalki, the tenth and final avatar of Vishnu, eradicates the impiety that has infected the world in the Kali yuga (the dark age) in order to prepare for a repetition of the first age, the age of righteousness (the Satya yuga).

Eschatology, however, does not concern only narratives of the end times; it also describes the objects of a religion's hope. Jewish eschatology, thus, relates fundamentally to the restoration of the kingdom of Israel and the Davidic dynasty (Jeremiah 33:14–18). This doctrine develops chiefly in the prophetic books of the Bible, attributed to the period leading up to and during the fall and exile of Israel and Judah. The prophets foretell a time when the Lord will lead the people back from exile; and Yahweh's anointed servant, the Messiah, will reestablish the Davidic line and usher in an era of everlasting peace (Isaiah 11:1–16, Isaiah 2:1–2, Jeremiah 23:1–8). The holy city of Jerusalem will be rebuilt, and true worship at the Temple will be restored (Jeremiah 31:38–40, Ezekiel 40:1–44:31).

Since Christianity assumes that Jesus is the Messiah, it looks, therefore, toward the Messiah's *second* coming and believes that, when he returns, Jesus will bring a spiritual rather than a political restoration. Christians look toward Christ's return – the *parousia* – as the time when the dead will be raised and they, along with the living, will be judged by him. Those deemed righteous will enter into eternal life in heaven, and those found unjust will be relegated to eternal damnation. Likewise, Muslims hold heaven, Jannah, as the object of their hope. Jannah is a place where the righteous both enjoy sensual delights – flowing rivers (Sūra 2:25) and virgins – and participate in glorifying God (Sūra 10:9–10).

Since Buddhism does not conceive of a permanent enduring self, its eschatology takes a different form. The individual concern is not the attainment of heaven, but rather release from suffering. The Buddhist hopes to extinguish desire and the passions and thus end suffering, ultimately breaking free from the cycle of *samsāra* – birth, death, and reincarnation – in the attainment of *nirvana*. Pure Land Buddhism differs, however; here, the person desires to be reborn in the Land of Bliss, a heavenly land created by the Amitābha Buddha.

To be sure, disagreement over eschatological details has resulted in doctrinal division within religious traditions. To take an example from Christianity, Revelation 1:1–10 tells of a 1000 year period during which Satan will be chained in the abyss and the martyrs will reign. After these 1000 years, Satan will be released and will once again lead people of all nations astray before his final defeat and his eternal torment in the lake of fire begins. Whereas Catholic and most mainline Protestant churches deny a literal millennium, other Christians affirm it. Within this latter camp, there is a division between those who believe that Christ's second coming will precede the 1000 years (premillennialists) and those who believe the millennium will occur before his return (postmillennialists). In general, those subscribing to millennialist eschatologies have a strong belief that Christians must, during the reign of Christ, work to establish his kingdom on earth. Nonetheless, Christians are united in their

belief in an afterlife, although even in this realm, there are debates. The Catholic Church holds that only saints go immediately to heaven; others must be cleansed in Purgatory before going to heaven. Protestants deny the doctrine of Purgatory, claiming that it is unbiblical and that it mitigates the salvific work of Christ.

Commentary

Perhaps more than any other doctrinal category, eschatology has reflected the historical and scientific concerns of the time and, likewise, has absorbed its anxieties. Thus, in late antiquity, we see Christian theologians pondering the resurrection of the body, with their primary concern being *how*, precisely, God will reconstruct, at the resurrection, a body that has decomposed or even been eaten by another creature. While this particular question may strike us as naïve, it is certain that religious traditions that espouse belief in a bodily resurrection must wrestle with what the ramifications are for treatment of the human body, living and dead, and for the precise relationship of body and soul; for a religion's eschatology reflects, in many aspects, crucial aspects of its theological anthropology.

Following World War I, philosophers and theologians confronted a loss of optimism about history and its developments; World War II and the Shoah heightened this sense. In the wake of this pessimism, eschatology emphasized new themes as theologians attempted to reinvest history with meaning. For some, including the Protestant Jürgen Moltmann and the Catholic Johann-Baptist Metz, both German, this meant infusing eschatology with a call for praxis. Both Moltmann and Metz were influenced by the revisionary Marxist Ernst Bloch and demanded concrete engagement with history in its actuality, rather than merely through theory. Moltmann has focused on the necessity of hope in the face of suffering. Metz has presented an extremely intersubjective eschatology; all persons must become subjects, he asserts. Yet one person's achievement of subjectivity does not compete with another's; rather, each person's subjectivity *depends upon* the

actualization of every other person's subjectivity. Without explicitly engaging it, Metz theologically parallels social psychology's understanding of the self as at least partially socially constructed.

Rudolf Bultmann, on the other hand, developed his eschatology out of an engagement with existentialism. For Bultmann, humanity's orientation toward the future demands that the person resist the idolatry of security and instead embrace the freedom and risk of the present.

Beginning in the latter twentieth century, eschatology has increasingly entered into dialogue with science. This conversation has led, on the one hand, to a renewed emphasis on the significance of the environment in the eschatological process. Additionally, the introduction of neuroscience into the eschatological discussion has raised the question of what, precisely, *is* the soul that endures beyond death and how much of it is reducible to the brain.

Additionally, in the latter twentieth century, psychologist Robert Jay Lifton has engaged depth psychology to suggest that the human search for immortality need not imply an actual life beyond death. Instead, Lifton suggests, immortality can also be achieved biologically (living through one's descendants) or through the production of enduring creative works.

Esoteric Buddhism

Paul Larson

The Chicago School of Professional Psychology,
Chicago, IL, USA

Esoteric Buddhism is better known as Vajrayana Buddhism, from the Sanskrit meaning “Diamond Way.” This is the major form of Buddhism in Tibet, Mongolia, in the Russian states of Buryatia and Kalmykia. It is also a minority group within Buddhists in Japan (Shingon school). This is generally considered a third “yana” or “vehicle” in Buddhism. The other two are the Hinayana (“lesser vehicle”) and the Mahayana (“greater vehicle”). Most of the earlier forms of Hinayana have died out, though the stream that has continued into the present is now termed ‘Theravada’ to

avoid the somewhat pejorative implication of a lesser vehicle. All of the varieties of esoteric Buddhism share much doctrine with the other two schools, especially the Mahayana schools, and to that add influences from the Pan-Indian spiritual movement known as Tantrism.

Tantrism was a development in Indian spirituality that came in reaction to the asceticism and restraint of typical Hindu or Buddhist practice. It is sometimes known as the left-hand path for its use of activities or symbolic activities that are normally prohibited, especially sexuality. Snellgrove (1987) discusses how early and literal enactment for forbidden dietary practices, intoxication, and sexual activity was used as a way of breaking out of the dialectic of moral categories and using pure experience as a vehicle for direct gnosis. Over time, the degree of actual enactment diminished and was replaced by symbolic enactment. Westerners have been particularly attracted to the sexual aspects of Tantrism in either actual practice or imagery work. Numerous popular redactions of Tantric practices in the West tend to pitch it as a way of heightening one’s sexual pleasure through withholding orgasm, among other techniques.

It can be said, however, that Tantrism is one of the few places where the sexual act itself is sacralized and used as a vehicle for spiritual development. In most religious contexts, sexuality is seen as a rampant desire that needs to be controlled in order for spiritual development to proceed. This stems from a root philosophy common to both East and West that the body and the material plane of existence are inferior to the mental, psychic, and spiritual planes, which being non-material are therefore higher in the spiritual nature. This idea is not inherently anti-sexual, though it lends itself to that emphasis. There are examples within both Indian and classical pagan spirituality of positive views of sexuality in moderation and restraint, while still recognized the superiority of the spiritual realm.

Be that as it may, sexual imagery is a foundational aspect of Tantric practice. The divine is typically portrayed in physical forms of both male and female and often in sexual union. If one chooses not to use a physical partner, Tantric

practice involves generating imagery, identifying oneself with one aspect of the deity and visualizing various manipulations of spiritual energy in that form. At the conclusion of the practice, the image is dissolved and one sits in meditation. In Buddhist forms of Tantrism, this is linked to the basic Mahayana doctrine of emptiness (Skt. “*shunyata*”).

At its heart, Tantric practice is the working of high magic. There is a great deal of similarity between techniques used by Tantric adepts and those who are initiates in Western occult or magical traditions. That is, the basic spiritual practice involves generating spiritual energy and in a disciplined manner going through several transformational rituals that manipulate that energy and put it to one or more usage. Thus, meditation practices in esoteric Buddhism make extensive use of multisensory phenomena in trance work. Visual imagery; use of physical gestures (Skt. “*mudras*”); chanting either aloud or silently, mantras, or verbal formulas; repetition of a variety of prayers; and the invocation of divine presence (similar to “drawing down the moon” in Western occultism) are all found in the various “*sadhannas*” or sequence of events that are made part of daily spiritual practice.

The ability to draw down the divine force into direct embodiment goes back to the earliest shamanic practices before the evolution of larger world religions and spiritual movements. In this sense, Tantric practice makes connection to the earliest layer of human spirituality while filtering it through a more evolved theology. Magical practices continued even as civilizations resulted in the bureaucratization of religion and the development of theologies with elaborate logical and explanatory structures.

Because of the intense nature of the imagery and/or actual practices, as well as in keeping with the elaborate formalism of ritual, a direct connection between a student and a practitioner is emphasized. The “guru” and “chela” relationship found in both Hindu and Buddhist traditions is deepened by the requirement of secrecy of teachings and the rite of initiation into a set of mysteries and practices through a gradual and sequential

curriculum. The instruction in correct practice of the meditational and ritual practices is a key element. The many texts of Tantric practice were originally kept secret, but now one can find most of them published in both the academic and popular press. Initiates are still generally instructed to keep things like mantras and detailed instructions private, to not disclose to those not initiated in the tradition. To support this privacy, there are often admonitions about the hazards of unauthorized practice.

Shingon Buddhism in Japan began in the 8th century led by Kukai (774–835 CE) and was influenced by Tantrism through Nagarjuna. Many of the beliefs and practices are congruent with the other Tantric forms of Buddhism found in Tibet and Mongolia.

In Tibetan Buddhism, these initiations are termed “empowerments.” Each of the many deities has their own particular “*sadhanna*” or practice. A qualified lama will generally give empowerments as well as less ritualized and more public talks about Buddha Dharma (Buddhist teachings and practice). Disciples accumulate several or even many empowerments over the course of their involvement in the spiritual community. Each empowerment comes with its own commitments to develop the practice and integrate it into one’s daily spiritual work, though the more one takes on, the less it is possible to pursue any one in depth.

Esoteric Buddhism emerged in the first millennium of the Common Era. It was heavily influenced by teaches from Nalanda, the greatest Buddhist monastic and scholarly community. This was the principal school for Buddhist from the seventh through twelfth centuries in India. Its destruction in 1193 presaged the disappearance of Buddhism from its native soil until the late nineteenth century, when a Buddhist revival began, and the twentieth century, when the Tibetan diaspora fed the growth of Buddhism in India. Among the most influential teachers was Nagarjuna (150–250 CE). He expanded on the doctrine of emptiness as found in the Perfection of Wisdom sutra (Skt. “*prajnaparamita*”), one of the earliest Mahayana sutras. That doctrine is a healthy

counterpoint to the heady mixture of imagery and concentration which is part of any ritual-based practice; realizing that, in the end, one has to come back from the “high” of the energy at its peak to the same dispassionate awareness of momentary experience, including suffering which is part of mindfulness practice common to all forms of Buddhist meditation.

Esotericism and Psychology

Matthew Dillon

Religious Studies: Gnosticism, Esotericism, Mysticism, Rice University, Houston, TX, USA

Similar to the affiliated term “Gnosticism,” Western Esotericism is a scholarly term with taproots dipping back into Late Antiquity that has only recently been recognized as an independent subject in religious studies. After presenting the classic definition of Esotericism, this entry will trace the etymology of the term and the subject matter typically found under its umbrella. The second half of the entry will broadly outline the historical

relationship between esotericism and the psychological sciences beginning with Franz Anton Mesmer and culminating in the contemporary New Age.

Meanings of Esotericism

Antoine Faivre, the father and leading figure of Western Esotericism as an academic discipline, defined Western Esotericism as a “form of thought” that can be recognized by the presence of four intrinsic characteristics in a thinker, movement, or text:

- *Correspondences*: Symbolic and real correspondences are understood to exist between various levels of physical reality, history and the unseen or divine. For example, the cards of the Tarot deck may correspond to the Sephirot of the Kabbalistic Tree of Life, or various body parts may correspond to the planets and their influences.
- *Living Nature*: Nature here is not merely a collection of physical phenomena but is a nature seen, known, and experienced as *essentially* alive in all its parts. Earlier views may see a hidden fire beneath material manifestations, while later esotericists may refer to ether, astral light, or even consciousness.
- *Imagination and Mediations*: Largely derived from the work of Henry Corbin, Faivre sharply distinguishes the notion of “imagination” from the realm of “fantasy,” or mere mind play in the form of images. Imagination here is rather an “organ of the soul” which allows humans to enter into a visionary relationship with angels and daemons inhabiting the *mundus imaginalis* between the physical and spiritual worlds. Furthermore, this organ of the soul is precisely what allows the esotericist to decode the significations and correspondences of nature, as well as to simultaneously participate in multiple planes of reference so that myths, magic, and rituals in the physical realm operate on the higher planes.

- *Experience of Transmutation*: Faivre uses this characteristic to separate true esotericism from mere speculative philosophy. Transmutation consists of a form of illumination knowledge, or *gnosis*, which leads to the second birth.

These four intrinsic characteristics are often, but not necessarily, found with the following two characteristics:

- *The Praxis of Concordance*: Most commonly understood as *philosophia perennis*, esotericists may look to establish common denominators between two or more traditions in the hopes of gaining illumination or gnosis.
- *Transmission*: Faivre's sixth characteristic refers to the practice whereby esoteric knowledge should only be transmitted from a master to a disciple within a preestablished channel. This characteristic is most commonly found in initiatory societies (Faivre 1994).

Etymology and History

The term "esotericism" is derived from the Greek adjective *esoterikos*, "inner." Early in its recorded usage, it was adopted by Patristics such as Origen and Gregory of Nyssa to refer to secret teachings reserved for the mystical elite found in a variety of philosophical schools and mystery cults. The substantive "esotericism" is of comparatively recent origin. The German noun *Esoterik* appears to have been coined in a critical commentary to Christoph Meiners' *Revision der Philosophie* by Johann Gottfried Eichorn as a reference to the domain of "inner" philosophy in 1792, therefore carrying much of the connotations of "secret" and "hidden" found in the adjective (Neugebauer-Wölk 2010). It was only through the nineteenth-century French occultist Eliphas Levi that the French cognate *l'esoterisme* expanded in popularity and geography, as occultists on both sides of the Atlantic used the term not merely in the sense of "hidden knowledge" but also to refer to a Tradition of such knowledge and practices stretching through Western history that they saw themselves belonging to.

While scholars recognize an actual tradition of secret knowledge is historically implausible, the family resemblance of these figures, movements, and texts has helped identify a terrain of scholarly inquiry that reflects the emic religious construction at many points. These figures and currents commonly include Gnosticism, Hermetism, Theurgy, ritual magic, astrology, and alchemical experimentation as sources of and precursors to the birth of Western Esotericism proper in the Renaissance. Due to the translation of the *Corpus Hermeticum* into Latin by the magician and philosopher Marsilio Ficino in 1471, alongside of several other Platonic, Theurgic, and Neoplatonic texts, the European intelligentsia produced a staggering number of magical and philosophical works, the resulting fruits of which are broadly defined as the "occult philosophy." Moving forward from the Renaissance, the category typically includes Christian Kabbalah, Paracelsianism, Jacob Boehme and Christian Theosophy, organized esoteric organizations such as the Freemasons and Rosicrucians, Louis-Claude Saint-Martin and Martinism, French Illuminism, Franz Anton Mesmer and Mesmerism, and Eliphas Levi and the birth of the modern occult.

With the establishment of scientific materialism during the Enlightenment as the dominant cosmological paradigm culminating in what Max Weber referred to as a "disenchantment of the world," each of Faivre's four intrinsic characteristics of Western Esotericism must typically be considered implausible or scientifically untenable. Esotericism beginning with the occult is therefore understood as qualitatively different due to its need to respond in some way to this disenchanted worldview, and adoptions of and participation with psychological discourse have been the primary new mode of legitimization (Hanegraaff 1998). Later manifestations of Esotericism such as the Theosophical Society and the Hermetic Order of the Golden Dawn, up to and including the New Age and Neo-Paganism, exhibit this cross-fertilization of esotericism and psychoanalysis, while psychologists themselves have interpreted elements of historical esotericism – such as magic and alchemy – psychologically, often having their interpretations

reincorporated into the understandings of practical occultists.

Eighteenth to Mid-Nineteenth Century

Although historically earlier esotericists have been read for psychological insight, the inception of psychology into esoteric thinking lies in the experiments of Franz Anton Mesmer. In his 1766 dissertation, the French medical doctor argued for the influence of planets on human maladies. Mesmer hypothesized that an invisible fluid permeates the physical universe and that illness was caused by imbalance of this fluid within the patient. In 1773, Mesmer began his experiments with one Miss Osterlin in order to test this hypothesis, and the resulting trance state of the patient and his practice of healing through magnetic shifting of the fluid became known as animal magnetism.

A cultural fashion in its time, animal magnetism attracted the attention of many intellectuals of the late eighteenth and early nineteenth century. One in particular, Marquis de Puysegur, began his own experiments in 1784. While magnetizing Victor Race, he discovered astonishing phenomena that Mesmer left unreported: the patient exhibited an entirely new personality, showed a capacity for clairvoyance and mind reading, and was able to diagnose his own malady and prescribe his own cure. De Puysegur was able to reproduce this state in his patients with some consistency. Despite early sympathy from the medical establishment in France, by 1842 the Academy of Medicine denied any validity to animal magnetism.

Exiled by medical science, the theorization of this trance state often fell to esotericists. German *Naturphilosophers*, with their theologies of light and electricity behind “living nature,” easily incorporated magnetic phenomena into their systems. In particular, the physiological hypothesis of two distinct nerve systems – the cerebrospinal system, which was responsible for diurnal, rational thought, and the ganglion system that was responsible for phenomena and perceptions of the “night side of life” – became an early

prototype for theories of mind that give independence to the unconscious.

Across the Atlantic, animal magnetism helped to catalyze a variety of religious movements that can be defined as esoteric. In 1837, Charles Poyen went on a lecture tour of the Eastern coast of the USA to demonstrate animal magnetism. Although Poyen departed in 1839, he recruited dozens of “lieutenants” to continue the lecture tour. One of them, J. Stanley Grimes, would introduce and inspire Andrew Jackson Davis to magnetism. Davis proved especially prone, and his visionary experiences and the accounts of conversations with his control spirits provided the most sophisticated and elaborate cosmology of American Spiritualism. Phineas Quimby, another trance subject of Poyen, founded “New Thought” based on his realization that patients could cure themselves by recognizing the superiority of mental operations over material causes.

Mid-Nineteenth Century to Present

James Braid, suspicious of the metaphysical trappings of animal magnetism, invented the technique of hypnosis as an attenuated form of Mesmer’s practice in 1843. In this form hypnosis would reenter the medical establishment proper through the researches at the *Salpêtrière* in France by Pierre Janet and Jean-Martin Charcot. Janet’s major thesis *L’Automatisme Psychologique* detailed his researches with the hypnotized subject Leonie. His work on multiple personality disorder, as well as Charcot’s on hysteria, would help institute a theory of mind where the “night side of life” was associated with physiological disease and mental illness.

Other early professional psychologists offered reductive readings of spiritualist and mesmerist trance as well. The French psychologist Theodore Flournoy’s (1900/1994) *From India to the Planet Mars* interpreted the hypnotic subject Catherine-Elise Muller and her accounts of past incarnations and the life on Mars as proof of a poetic, creative faculty in the subconscious capable of distinctive cerebration. Carl Jung’s (1902/1978) own dissertation, *On So-Called Occult Phenomena*, interpreted

the mediumistic trance phenomena of his cousin, Helene Preiswerk, as repressed complexes of the conscious personality activated in trance and acted out through personalities assembled through memories of former relations. While less reductive interpretations of hypnotic phenomena could be found in the work of William James and Frederick Myers, their voices were marginalized in later psychoanalytic discourse.

Practicing occultists at the turn of the twentieth century, many of whom were familiar with the researches of Janet and Freud, utilized techniques similar to animal magnetism for achieving self-trances in order to activate “night-side” powers of the personality and travel astral realms through the imagination. These magical efforts were dedicated towards transcending one’s ephemeral ego awareness and communicating with one’s “Higher Self” or “Genius,” through whom one could come to know the divine. This threefold anthropology corresponded to their three-part cosmology, where the material universe could be transcended to navigate the “Astral Light,” the fine-material substance occluded by physical reality which held within it infinite imaginal territories. Unlike their psychological counterparts, these realms and beings were given ontological reality, but like the psychologists they now placed access to them within the mind of the magician and theorized a fragmented and multiple self with conscious and unconscious dimensions (Owen 2007).

Psychoanalytic readings and adoptions of Esoteric thought in the early twentieth century helped facilitate the transition to a more fully developed psychologization of magic and esotericism. Herbert Silberer, the Freudian psychoanalyst, was the first to analyze alchemical and Rosicrucian texts from this angle (Silberer 1914). He concluded that while these texts could be read as Oedipal wish fulfillments, their meaning pointed to the use of introversion to release libidinous energy into mystical states. Jung’s own experiments with active imagination, later captured in *The Red Book*, were one of the sources he used in developing his phenomenology of the self in terms of the anima, shadow, and Self archetypes (Homans 1979). Jung’s later writings on alchemy also

provided a robust theoretical language that practicing occultists could adopt in order to understand their practice as a form of self-development without necessarily denying ontological dimensions to their experiences. In turn, by the mid-twentieth century, major figures in magic such as Dion Fortune and Israel Regardie had become practicing psychotherapists themselves.

By the late twentieth century, the New Age and affiliated currents had become so thoroughly imbued with psychological discourses that analytically separating “esoteric” from “psychoanalytic” discourses in the occult literature was impossible. Later developments in the psychological sciences such as transpersonal and alchemical psychology were eventually incorporated into the occult bricolage alongside the early adoption of Jungism. Although the contemporary occult literature is too vast to make uniform claims, in general the psychoanalytic discourse provides a framework for conceiving magical practice as a technology for psychological expansion, while the choice of psychological frames adopted allows a pragmatic attitude towards the ultimate ontological source of the experiences themselves (Hanegraaff 2006; Luhrmann 1989).

Ethics and Ethical Behavior

Claudia Nagel
Nagel and Company Management Consulting,
Offenbach, Germany

Introduction

Human beings are constantly judging their own actions and those of others. Good and evil, moral and amoral, and conscienceless are the respective judgments whereby we implicitly assume that

“one” knows the basic difference between good and evil. Moral conduct is thus always attributed to the individual, who is regarded as being responsible for their actions and held accountable for such, i.e., the individual must answer to themselves, their own conscience, or an external authority or institution. Moral behavior therefore presupposes the concept of voluntariness and freedom. Conscience, freedom, and responsibility are central concepts of moral behavior and ethics as the philosophical doctrine of morally relevant behavior (Moral Philosophy).

Ethics as a philosophical discipline dates back to Aristotle, who also pursued the earlier approaches of Plato and Socrates. The term ethics is derived from the Ancient Greek “*ethikos*,” meaning custom, habit, or tradition. Although the adjective or adverb forms of moral and ethical are frequently used synonymously, here the following differentiation – outlined by Anzenbacher (1992a) based on Kant’s definition – is made: an action is moral if it is judged independently of the individual conscience of the agent, whereas ethical refers to being in accordance with convention and is thus placed in a social context. There it must be discussed which norms with regard to the cultural and societal context are the base for an ethical action.

Guided by the idea of a meaningful human life, i.e., a morally good and just life, philosophical ethics attempts to make universally valid statements about good and just behavior in a methodical manner – without reference to political and religious authorities or the well-tried way. It is primarily concerned with an answer to the questions: “What shall I do? Who do I want to be? How do I want to live? What is a successful and happy existence?”. It is complemented by questions such as “In what kind of social and political environment do we want to and shall we live?” (Höffe 1999).

Major Contents and Methodological Positions of Ethics

The Ethics of Morality was first defined by Aristotle. It describes the respective historically

and socially relevant norms and values as the basis for virtuous moral conduct; these shall be realized sagaciously.

The autonomous *Ethics of Reason* is subject to a rigorous principle of morals and posited primarily by *Kant*. Norms must be verifiable with the aid of a procedure which claims universal and categorical validity. The *categorical imperative* is of the highest order and demands with consideration of our respective subjective maxims (life principles) to “Act only according to that maxim whereby you can at the same time will that it should become a principle of general law.” The decisive factor is alone the individual’s good will guided by reason. This approach has therefore also been discussed as an Ethics of Conviction. Kant asks for the conditions of the possibility for moral action.

Utilitarian Ethics, an approach posited by *J. Bentham* and *J. St. Mill*, is concerned with “the greatest happiness of the greatest number” and serves as a guideline for weighing the utility of an action and its consequences. As a result of the utility principle, the well-being of the individual comes after that of society as a whole, and a rational examination of the action is performed against the background of its concrete, foreseeable results (Lang 1992).

In *Scherer’s phenomenological approach to Value Ethics*, a hierarchy of tangible values which possess an objective quality (pleasure/pain; approve/disapprove; love/hate) is developed, where an action is described as moral when the respective highest-ranked value is realized (Pieper 2007).

In contemporary philosophy, the *Discourse Ethics of Habermas and Apel* (developed as Ethics of Reason) plays an important role. They attempt to determine a rational foundation of reason by asking what we need to presuppose to conduct meaningful argumentation. The starting point is the discourse, the argumentation in speech. In argument, the individual implicitly commits to uphold four validity claims: understandability, truth, rightness, and truthfulness/frankness. These commitments are moral in a twofold sense: In the sense of an ethics of truthful communication, they commit the subject to

reason and represent a criterion for the negotiation and evaluation of moral norms. All norms upon which an agreement is reached by common consent in a discourse without constraints are morally binding (Lang 1992).

Alternative contemporary approaches to Discourse Ethics are anti-universalistic and relativistic, e.g., the *Usualistic Ethics* of Odo Marquard (1981, 2007). Marquard's position is characterized by a skeptical stance and the renunciation of an ultimate moral standard and is oriented toward the concrete moral horizon of the "usual." He thus arranges himself in a skeptical position between absolute knowledge and absolute ignorance in the sense of the Aristotelian doctrine of mesotes (extremes are to be avoided) (Lang 1992).

In addition to the described differences in terms of content, systematic differentiations also have an important role regarding the question of the content of ethics. Differentiations are made between *Descriptive Ethics*, which is concerned primarily with the examination, description, and explanation of the phenomena of morals and conventions; *Normative Ethics*, whose principal concern is the critical analysis of prevailing morals and the reasons for forms and principles of right and good actions; and *Metaethics*, which attempts the critical analysis of linguistic elements in moral statements.

Based on the *Ethics of Responsibility*, the individual considers all possible consequences of a specific action in the evaluation of their decision to perform this action, while Ethics of Conviction is oriented alone toward the good intention, the good will.

The differentiation between *Formal* and *Material Ethics*, which is related to the differentiation between *Deontological* (obligation-oriented) *Ethics* and *Teleological* (goal-oriented) *Ethics*, is indebted to Kant. *Formal Ethics* (*Ethics of Reason*) is based on the universal idea of duty and moral law. These have the character of unconditional, universally valid claims based on the transcendental view of obligation "from the universal concept of the reasoning being as such." Exclusively applied are the precepts of rationality and the respective test procedures. It is the self-willing and determining reason which constitutes morality. *Material Ethics* bases

the concept of morality on the understanding, willing, and pursuit of good purposes or values (e.g., Virtue Ethics, Value Ethics). Material Ethics is frequently viewed as a complement to Formal Ethics, in as far as it holds the criteria which serve to examine the moral value of goals and content (Höffe 2002).

Central Questions of Ethics

Despite the different approaches and groupings, ethics is essentially concerned with three topics. These topics are also significant from a psychological perspective, because they are of basic relevance to all human experience:

1. Happiness
2. Good and evil
3. Freedom (Pieper 2007)

It is in the nature of most humans to strive for *happiness*. Ethics expounds on this pursuit for happiness and asks if and how it can be morally justified. While one school of moral philosophers claims that happiness represents the highest normative principle (Hedonist, Utilitarian, Eudemonistic, Egoistical Ethics), another puts the principle of duty before happiness; the pursuit of virtue, morality, and reason are given priority (Plato, Spinoza, Kant). It is, however, crucial that happiness cannot be achieved directly, but only through concrete goals, whose attainment holds the promise of satisfaction and thus of happiness. Furthermore, happiness does not simply occur, but needs to be actively pursued in a practice which contributes to a meaningful life when successfully accomplished.

Good in itself is one of the central principles of ethics. In Greek philosophy and metaphysics, the Good is the essence of all being, the goal toward which all action is directed and through which man becomes wholly himself (Plato, Aristotle). Any kind of action or reflection is morally good when it is good in itself and independent of being good to something else or for something else. Kant states, "Nothing can be thought anywhere in this world, or even outside the same, which can

unreservedly be regarded as good, except the good will alone . . . The good will is not good through that which it effects or accomplishes, nor through its usefulness in achieving a certain purpose, but it is good through the willing only, good in itself” (Kant 1995b – *Groundwork of the Metaphysics of Morals*: 180f).

Joined in the concept of the highest Good, in which consummate personhood is reflected, are the three topics of ethics: happiness, freedom, and the Good (Pieper 2007). “It is a priori (morally) required to achieve the highest Good through the freedom of will, . . . In the highest for us practicable – i.e., realizable through our will – Good, virtue and happiness have to be thought as necessary and connected” (Kant 1995b, p. 173).

The recurring term *freedom* is, in fact, of even greater importance to ethics, because it implies both precondition and goal. Today the question arises based on recent findings from neurobiology, attachment research, and psychoanalysis on how free the human being is in their actions. Were behavior – as it is understood by some behaviorists and neurobiologists – completely predetermined, there would no longer be a need for a science of morals.

While freedom was seen as self-evident in antiquity, since Kant, it has assumed great importance in the reflections of modern ethics. As a “natural being,” man is other-directed as a result of his sensuality, i.e., his drives, instincts, feelings, passions, needs, and interests (heteronomy). Even if he cannot invalidate the laws of nature, he can decide what he can want, shall want, or not want, i.e., he can act self-determinedly (autonomy). Because he can free himself from the constraints of nature and determine autonomously what he can want, he uses his moral freedom. In contrast to unconstrained freedom and arbitrariness, moral freedom refers to the freedom of others and acknowledges this as a principle. The contradiction between unconstrained, absolute freedom and freedom which delimits itself with consideration of the freedom of others characterizes moral freedom. Moral freedom is the basis for freedom of action. Freedom of action, which means not merely to want the Good, but to do it, is always limited by the prevailing circumstances.

Inherent in the concept of freedom is also one of the limits of ethics. As a theory it cannot be its own practice, because the realization of freedom lies outside itself. The individual is moral through will; it is not ethics that renders one moral. In addition, because freedom is one of its presuppositions, ethics cannot develop a material catalog of norms. It can, however, substantiate formal norms whose critical application functions as a standard for material norms. Critical evaluation and application is ultimately left to the acting individual (Pieper 2007).

The goals of ethics, which are of importance to humans from a psychological standpoint, may be summarized as the reflective enlightenment of the acting individual in regard to the moral conditions of their actions. With comprehension of freedom as an essential element for the human being, the critical power of judgment of moral actions, i.e., the critical differentiation between good and evil before the background of freedom as an unconditional principle, has to be practiced. A third crucial element represents the acquisition of moral competence and social responsibility (Pieper 2007).

The Psychic Development of Moral Competence as the Basis for Moral Conduct

Two significant directions can be identified regarding the development of moral competence: the psychoanalytical view of Freud, complemented by several aspects from Jung, and the theories of developmental psychology ranging from Mead to Piaget and Kohlberg to Gilligan.

Kohlberg’s theory of moral development (Kohlberg 1984) is based on Piaget’s stages of cognitive development and his division of moral development into a premoral, a heteronomous, and an autonomous stage, analyzing the child’s changing awareness of rules. Founded on the results of his empirical research, Kohlberg added three additional stages to those of Piaget and summarized these in three levels (Table 1).

Kohlberg’s stages of moral development are based on the conception of a moral of justice as proposed by Carol Gilligan (1982). Gilligan

Ethics and Ethical Behavior, Table 1 Stages of moral development

Level	Stage	Moral orientation
I. Pre-conventional level	1	Obedience and punishment orientation
	2	Self-interest orientation
II. Conventional level	3	Interpersonal accord and conformity
	4	Authority and social order maintaining orientation
III. Post-conventional level	5	Social contract orientation
	6	Universal ethical principles orientation

From Garz (2006, p. 102)

has elaborated Kohlberg's theory of moral development by introducing the moral concept of caring, starting from the premise that both attitudes to morality are in a dialectical relationship. This approach is of particular interest because it complements the so-called "male" abstract moral with a "female" moral of human caring (Garz 2006, p. 117).

Freedom and Psychoanalysis

Prior to Kant, psychology was a branch of Special Metaphysics. In contrast to General Metaphysics, i.e., ontology (the science of the nature of being), psychology was regarded as Special Metaphysics, concerning itself, as the "science of the soul," with questions of self-knowledge, identity, and oneness of consciousness. The focus of psychology has since then been on concrete psychic experience (Pieper 2007).

In addition to the development of moral competence, the question as to where conscience or morality can be located in the human psyche is of interest from a psychoanalytical perspective. In his theory of psychic structure, Freud names the superego as the judge or censor of the ego. The superego's functions comprise the conscience, self-observation, and ideal formation. This term therefore designates the presence of internalized values, commands, and prohibitions. The super-ego develops in the child after an extended period

of need for support with the Oedipus complex and as a result of the fear of loss of paternal love. From a philosophical viewpoint, this would be expressed as follows: "The demand of the conscience (superego) may thus be seen as the advice to act wisely: Act in conformity with your conscience or you will lose the goodwill of the one whose protection and help you need" (Anzenbacher 1992b, p. 207). Freud (1999) views morality as a strategy, in which culture, indirectly also serving the pleasure principle, attempts to defend itself against the destructiveness of aggression. Culture virtually installs the superego in the individual to serve as his conscience which constrains the ego; this leads to the development of a sense of guilt and the need for punishment and thus to the diminishment of aggression.

Freud considers the quest for the highest Good, the purpose in life, as emerging from the pleasure principle, which takes priority over everything else. This would, however, completely instrumentalize reason and cannot become practical as pure reason in the sense of Kant. This, in turn, would form the first result in the leveling of an independent meaning of morality (Anzenbacher 1992a).

Jung (1995, § 825–857) asserts that ethics and morals are innate, because without the ability of the psyche to experience guilt, there can be no sense of guilt. Furthermore, the omnipresent opposites are thereby raised to conscious awareness. Ethos is thus understood by Jung as a "special case of the transcendent function" which connects the unconscious with the conscious. Only in the conscious, reflective examination of one's own actions can what appears to be moral conduct be changed into ethical conduct. From a religious standpoint, Jung defines this as the establishment of a connection between reason and grace.

In relation to the principles of ethics, psychotherapy and psychoanalysis as applied psychology also have an important role. Psychotherapeutic and psychoanalytic methods essentially consist of the dialogical working-through of the patient's emotional history. It is the aim of the therapy to free the individual

from psychic constraints through the bringing to consciousness, emotionally working through and processing of complex- and conflict-charged events that prevent them from living life as a truly liberated human being. This is a moral aim in a twofold sense, as it also requires the analyst to be conscious of their own responsibility. However, in contrast to ethics, psychology does not aim to reflect on the conditions of moral conduct, but to enable the human being to act morally. Through cognitive insight and emotional experiences, i.e., through self-knowledge, the individual shall recognize and integrate the constraining factors to achieve the capability of interaction. The discourse ethicist Habermas connects morality and psychoanalysis as follows: “Since the analysis imposes the experience of self-reflection on the patient, it calls for a ‘moral responsibility for the content’ of the disorder. Because insight as the aim of analysis is only this, namely that the *ego* of the patient is to recognize itself in the other represented by the disorder as his alienated *self* and identify with it. As in Hegel’s dialectic of morality, the offender recognizes his own destroyed being in his victim, an act of self-reflection through which the abstractly separated entities perceive the devastated moral totality as their common ground *and through this* are able to return to it. Analytic knowledge is, at the same time, moral knowledge” (Habermas 1968, p. 288).

In contrast to Habermas, Drewermann (1982), who, as a moral theologian, church critic, and psychoanalyst, attempts to establish a connection between religion and the unconscious, describes psychoanalysis as inherently amoral. Psychoanalysis is essentially concerned with the confrontation with never-questioned, internalized contents of the superego and so to decide against prevailing norms. “Every psychotherapy renders a bit more conscienceless, egomania, unscrupulousness. Every psychotherapy is therefore a kind of seduction, a lesson in immorality” (Drewermann 1982, p. 83). While he views this in one respect as positive in that it implies an increase in individual freedom, it is also from a Hegelian perspective a risk, because self-consciousness can be achieved

only in a life and death struggle. At stake in this struggle are the concepts of free or not free, self-determined, or other-directed, but not of good or evil. In the course of the struggle, the Old has to be cast off and combated; the subjectively accomplished acknowledgment of morality, i.e., the awareness of morality through a process of becoming conscious gained against the background of personal freedom, can be reintegrated only in a second step, according to Hegel. The New is then frequently identical with the cast-off Old, although now it is chosen self-determinedly and consciously. In the sense of Hegel, the moral dilemma would then be resolved. It remains, however, open to question if in the phase of self-discovery of the analysis, the second step is actually taken, i.e., if the reconnection to the prevailing morality is achieved or should even be achieved. This, in the sense of the goal of freedom, shall not be the aim of psychotherapy or psychoanalysis. If ethics were “repealed” and humans in their being good or being active would no longer find a justification for being or developing, there would nevertheless need to be another reason for the justification of being. Drewermann’s stance is that this can be found in man’s being as held in the grace of God. For him it is God who is the ultimate reason for man’s being, while the Moral is not the definitive measure of humanness. The aim of psychotherapy would then be the – humble – acknowledgment of one’s own being and the assumption of responsibility for one’s own life as a gift of God. His position is thus contrary to the basic principles of ethics, to find determinants for moral conduct outside of (religious) authorities.

Ethics in Counseling

Wayne E. Gustafson

Susquehanna Family Counseling Ministry, Ithaca, NY, USA

A parish minister “reminds” a presurgical patient to be “right with God” in case death results from the surgery. Or a psychotherapist insists that a woman leave her abusive husband without considering how her “faith” might inform her decision. Professional counseling, particularly when religious/spiritual elements are present, can be both a powerful and dangerous resource in the healing process. Think of *religion* as a conscious and socially organized expression of spirituality, based on a formal belief system about divine presence. And think of *spirituality* as a person’s unique relationship with whatever is beyond human experience. Because the temptation is always present for professional helpers to impose their conscious or unconscious values, ethical practice can limit the chances of inadvertently harming their clients.

To help protect both counselor and client and to promote healing, this entry considers:

1. *Context* – how religious/spiritual elements affect the ethical dynamics of the professional relationship
2. Recommended *safeguards* for counselor and client
3. Useful *resources and approaches* that promote ethical practice

Context

Spiritual/religious elements appear in two different settings:

1. When counseling parishioners, the pastoral role of the *religious professional*, such as a minister or priest, affects therapeutic transference including the counselee's projection of divine authority onto the counselor. The counselor's projection onto the client (e.g., This is the helpless person I am required to heal or save) is called *countertransference*. Both transference and countertransference are unconscious and, therefore, can only be utilized appropriately when brought to consciousness.

Example: A well-integrated religious professional would accurately identify and address the unavoidable dual relationship (pastor and counselor) affecting the counseling process and the exercise of the pastoral role. A poorly integrated religious professional might inadvertently use the power of the pastoral role to interpret the psychological frailties of the client (e.g., as "sinful") or clumsily psychologize the client's spirituality (e.g., as merely an attempt to explain the Divine Mystery), in either case potentially doing great harm.

2. *Secular counselors* who make use of religious/spiritual elements must understand the power of *spiritual/religious content* in the counseling relationship.

Example: A well-integrated counselor would possess a sufficiently broad understanding of the dynamics of religion/spirituality to assist a client in using them appropriately while honoring the client's religious/spiritual orientation. A poorly integrated counselor would purposefully (or inadvertently) impose the counselor's own religious/spiritual or secular framework onto the client's issues.

In both cases, the quality of integration between psychological and religious/spiritual concerns and roles necessarily affect *professional identity*. Furthermore, the well-integrated

professional must understand the power of both the pastoral role and the counselor role, including the heightened power of the combination and its consequent tendency to increase potential danger to the client. *Rather than indoctrinating or judging the client, ethically based counseling assists the client in self-exploration that makes use of psychological and/or religious perspectives.*

Safeguards

Some ethical and practical considerations follow:

Hippocratic Oath: "Do No Harm"

When a religious or secular professional engages in a counseling relationship with a client/parishioner, the potential to cause harm by overwhelming the client's healing process with the professional's expectations and unconscious agenda always exists. In a strictly *secular setting*, an example of harm is violating the client's personal boundaries, but *spiritual/religious* counseling can also play the needs of present life against the requirements of "salvation" (e.g., the Christian psychologist whose purpose for counseling is "soul-saving" rather than psychological healing). In these examples, religious/spiritual counselors must attend consciously to the conflict that may exist between present and eternal concerns.

The Power of the Divine to Impose Eternal Judgment

The client's projection onto the dually equipped counselor/minister may include the idea of divine reward or punishment. To be answerable to God is hard enough, but projection of the divine can interject enormous *judgmental power* into the identity of the professional. When the professional can recognize the nature of the projection, then client is then protected from the fear of eternal harm (e.g., the woman wanting to leave her abusive husband hears the religious professional telling her that divorce endangers her eternal soul, so she believes she must remain in the situation).

Ministerial Access to More Areas in Parishioner's Personal Lives

Professional counselors/psychotherapists are trained to create a safe counseling space, and professional literature and codes of ethics address safety issues. A religious professional, however, may have broader access to a parishioner's private world where appropriate professional boundaries may be less distinct and more difficult to maintain. Religious professionals must, therefore, adhere to clear ethical boundaries appropriate to their unique situation (e.g., counseling in the office, not the home).

Spiritual Intimacy

While counselors and ministers are usually trained to be aware of the depth of *intimacy* in a counseling relationship, such intimacy in relationships around matters of spirituality may be less obvious and potentially more dangerous for client and counselor alike. Spiritual language can carry a subtle sexualized meaning that can easily lead to boundary violations (e.g., spiritual intimacy may invite inappropriate touching). Professional supervision/consultation serves to protect against the danger by providing a more objective perspective.

Maturity of the Individual Versus Reliance on Religious Strictures

Many professional codes of ethics rely on prohibiting particular behaviors in the counseling relationship (e.g., sexual touching or economic transactions.) These useful guidelines do not replace the need for personal and professional maturity. Unexamined unconscious contents can too easily lead to violation of ethical boundaries, so supervision and the developing *maturity* of the professional remain essential. Professional maturity might include the following: attention to the potentially dangerous elements in counseling, awareness of one's own unconscious issues, and awareness of one's own needs and the ability to meet those outside of the counseling relationship. Maturity can also lower anxiety, helping the professional to be more intentional and thoughtful in the counseling relationship. Professional maturity

is more ethically reliable than rule-based obedience and compliance.

The Temptation to Impose One's Own Belief System onto the Client

Every counseling professional runs the risk of imposing his or her personal and often unconscious worldview and/or theology onto the client with potentially dangerous consequences. For example, either a secular or religiously based counselor could, even inadvertently, impose the idea that a married couple must have a particular kind of relationship, for example, a hierarchical power structure or a completely equal relationship, rather than helping them make an informed choice and help them develop the kind of relationship they desire.

The Unexplored "Shadow" of the Religious Professional

Codes of ethics for psychotherapists typically require significant self-examination so that unconscious issues are not projected onto clients. Self-examination, perhaps including personal psychotherapy, becomes particularly essential when religious content is the focus of the counseling. Good intentions, even when grounded in images of a benevolent divinity, do not eliminate the need for professional self-examination (e.g., a counselor who grew up with a judgmental parent could unconsciously impose the demands of a judgmental God onto clients).

Supervision and Consultation

The standards of practice for psychotherapy and ministry at one time required supervision of clinical work only for those still in training and not yet fully authorized. The emergence of many professional ethical violations, sometimes resulting in expensive litigation, caused most counseling organizations to require all clinicians to get regular supervision in order to protect against ethical violations. Many religious organizations still need to update their ethical requirements to include ongoing supervision for ministry. Supervision helps keep both professional and client safer in the more flexibly structured parish environment.

Awareness of the Presence and Effect of Any Dual Relationship and the Resultant Power Imbalance

Dual relationships, such as pastor/counselor or counselor/friend, are rare in some clinical settings and practically unavoidable in others. The ethical counselor will learn to be aware of dual relationships and how to manage them in the best interest of the client. An example comes from the Code of Ethics of the American Association of Pastoral Counselors (Principle III. E):

E. We recognize the trust placed in and unique power of the therapeutic relationship. While acknowledging the complexity of some pastoral relationships, we avoid exploiting the trust and dependency of clients. We avoid those dual or multiple relationships with clients which could impair our professional judgment, compromise the integrity of the treatment, and/or use the relationship for our own gain. A multiple relationship occurs when a pastoral counselor is in a professional role with a person and 1) at the same time is in another role with the same person, 2) at the same time is in a relationship with a person closely associated with or related to the person with whom the pastoral counselor has the professional relationship, or 3) promises to enter into another relationship in the future with the person or a person closely associated with or related to the person. In instances when dual or multiple relationships are unavoidable, particularly within congregations or in family or couples counseling, we take reasonable steps to protect the clients and are responsible for setting clear and appropriate boundaries (e.g. It would not be ethical for the counselor to sell a car to the client. Fair bargaining would be impossible to achieve in light of the power imbalance.).

Evaluating Ethical Dimensions in Any Professional Counseling Relationship

Professional codes of ethics often contain detailed lists of behaviors that support or detract from the ethical boundaries of the professional relationship. These behaviors might include rules about touching, appropriate settings for counseling, and adherence to particular religious beliefs. While these lists can be useful, they are limited by their specificity. Often these lists of prohibited behaviors do not fit the specifics exactly. Therefore, a framework for ethical analysis, like the one below modified from the *Faith Trust Institute*, provides an approach to

identifying the ethical elements of the professional relationship that can be readily applied to counseling relationships and other pastoral care situations.

Resources and Approaches

The elements of the following ethical analysis can be used either by oneself or with a supervisor to help promote safe and ethical counseling practices.

Violation of Role

In a counseling relationship, the counselor is the one held accountable for ethical behavior.

Does your behavior violate the role you are called to assume as a minister/counselor?

Is your professional/pastoral role clear and generally affirmed by all concerned parties? Do you understand the legal and moral responsibilities of your position? (e.g., the responsibility to maintain appropriate *boundaries*).

Do you understand and know how to work with the unavoidable power imbalance in the professional relationship? (e.g., A person seeking help will usually feel less powerful than the professional helper. Identifying the power imbalance openly gives counselor and client the opportunity to minimize its effects).

Misuse of Authority and Power

Do your actions constitute abuse or misuse of your authority and power as a minister/counselor?

Are you aware of the power and authority you carry in your ministerial/professional counselor position and of the expectations that your congregation and/or clients have for you? (e.g., A parishioner may believe that the pastor knows precisely what God expects in the immediate situation. The pastor must be honest with self and parishioner alike about the appropriate limits to that professional power).

Taking Advantage of Vulnerability

Do your actions violate the trust that your "relatively" vulnerable congregants/clients place in you?

Do you understand that context and relationship strongly affect a congregant's/client's experience of vulnerability and power and that the professional, too, can be affected by these? (e.g., When counselor and/or client believe that God will provide the necessary guidance, feelings of attraction can be misinterpreted as encouraging a sexual relationship).

Meaningful Consent

Do your congregants/clients have sufficient information and power to be completely responsible for the decisions they make in relating to you (and vice versa)?

What congregant/client decisions are affected by a power imbalance in your relationship and how free are congregants/clients to say "no" to requests from the pastor/counselor? Also, how free is the professional to say "no" to requests from parishioners/clients? (e.g., A client may believe that the counselor's suggestions must be followed rather than taking his or her own responsibility for choices.)

Summary

Clearly, the presence of spiritual/religious elements in a counseling relationship can increase the power for and danger to the client. Professional Codes of Ethics are essential for client protection, but professional awareness of dual relationships, attendance to personal maturity, sufficient respect for the power of the spiritual, and the use of proper assessment tools for ethical and boundary evaluation are also necessary for appropriate care of clients.

Ethics of the Fathers

Lynn Somerstein

Institute for Expressive Analysis, New York, NY, USA

“Ethics of the Fathers,” called, in Hebrew, *Pirkei Avot* and more properly translated as “Chapters of the Fathers,” is known as “Ethics of the Fathers” because of its content – a collection of laws, aphorisms, and guides to ethical behavior – wisdom literature that is over 2000 years old. It asks and tries to explain what makes a good person and how to get along with family members, teachers, and the neighbors. *Pirkei Avot* is concerned with down-to-earth, hands-on, practical living – like an early self-help book.

The emphasis is on doing, embodying the religious life even in everyday actions. This accessibility makes it very popular, so it is included in many prayer books. Some famous teaching examples are:

- Shammai: “Say little and do much” (Shapiro 2006, p. 15).
- Hillel: “Don’t judge your fellowman until you are in his place” (Shapiro 2006, p. 21).
- Ben Zoma: “Who is wise? He who learns from every man. . . . Who is a hero? He who controls his passions” (*Pirkei*, Ch 4, Minsha 1).
- Hillel: “If I am not for myself, then who will be for me? And if I am only for myself, what am I? And if not now, when?” (Shapiro 2006, p. 15).

Hillel’s question, “If I am only for myself, what am I?” (Shapiro 2006, p. 15), underlies individual human development – the search for the self and understanding who the self is in relation to others. Psychotherapeutic interaction concerns itself with searching deep within to find what is true for the individual and then finding ways for the individual to make contact with others, a process leading from a narcissistic engagement with the world to a fuller, open, mature being, whose everyday life

embodies a full engagement with God and the world.

Ethnic Religiosity

Abbas Aghdassi

Faculty of Theology and Islamic Studies,
Ferdowsi University of Mashhad, Mashhad, Iran

Introduction

The interaction between ethnicity and religiosity has various psychological implications, often absent in the literature. If a believer’s mentality filters religious practices through ethnic lenses, this could affect the understanding of fellow co-religionists coming from different ethnic backgrounds. It is important to know how ethnicity and religiosity converge and diverge in various circumstances. Ethnicity shows a more uninformed approach toward personal behavior, while religiosity highlights a more informed approach. *Ethnic religiosity* combines uninformed and informed actions and refers to a mental state in which ethnic practices of a particular group are translated as an authentic version of religiosity. This entry reviewed definitions of ethnicity, religiosity, and their probable interaction(s) in different situations, and concluded that prioritizing ethnicity (which perhaps avails the psyches of the lay members of a religious tradition) signals

an unintentional approach toward uninformed religiosity.

Ethnicity

Scholars from different backgrounds proposed definitions of ethnicity. In almost all categories, affiliation or identification of a person in/with a group defines their ethnic lines. Identification could entail a subjective stance while affiliation might highlight an objective stance. Isajiw (1993), for instance, argued that understanding ethnicity required a knowledge “of several other concepts, particularly those of an ethnic group and ethnic identity” and that “Ethnicity itself is an abstract concept which includes an implicit reference to both collective and individual aspects of the phenomenon.” To other scholars, ethnicity remained a more complex issue that had tight relationships with power, neglecting which “will be a model of ethnicity which is as trivial as it is one-sided” (Jenkins 1994). He concluded his remarks by adding that “Unless we can construct an understanding of ethnicity that can address all of [the] ethnicity’s facets and manifestations, from the celebratory communality of belonging to the final awful moment of genocide, we will have failed both ourselves and the people among whom we undertake our research.”

Three major classic schools proposed views on ethnicity: (a) primordialism, which emphasized an ascribed status of a person’s bloodline; (b) constructionism, which, as the name suggested, emphasized dynamic constructs in a social environment; (c) instrumentalism, which emphasized the usefulness of an ethnic layer for an individual. An integrated approach suggested combining all the three schools (see: Yang 2000, pp. 39–56). Despite the complexities highlighted by scholars like Jenkins, ethnicity may be understood as the product of social construct, ancestry, and utility (Yang 2000, p. 60).

Religiosity

Several scholars used religiosity interchangeably with spirituality, which might be due to the significant overlap between the two concepts (Mattis 2000). Glock and Stark suggested five elements of religiosity, i.e., ideological, intellectual, ritualistic, experiential, and consequential (1965). De Jong et al. (1976) “identified six dimensions of religiosity: belief, experience, religious practice, religious knowledge, individual moral consequences, and social consequences.” Cornwall et al. (1986) suggested six dimensions based on “three general components: religious belief, commitment, and behavior.” Needless to mention that most of the categorizations relied on operational definitions, which offered a mixture of substantive and functional meanings (see: King and Hunt (1972) in Bellu and Fiume 2004). Of note is that the above studies did not discuss the state of informed-ness or un-informed-ness of ethnicity and religiosity among the affiliate members.

Ethnic Religiosity

Ethnic religiosity has sometimes been regarded as an “immigrant religiosity,” or a “metropolitan religiousness,” based on which Dumont classified its manifestation into five categories: “religion as the conveyor of (ethno-)cultural bridging, religion as an instrument of socio-cultural integration, religion as an engine of non-adaptation, religion and cultural-religious syncretism, and religion as guardian of the culture of origin.” (Dumont 2003). The concept of “ethnic religion” has also been proposed to discuss how religion might become a symbolic tool for belonging to an ethnic legacy (Hervieu-Léger 2006). Some have used ethnic religiosity interchangeably with “religious ethnicity” (Zenner and Avruch 1997). Obviously, the two concepts offer different connotations. While “ethnic religiosity” emphasizes ethnicization (and hence validation) of a particular way of religiosity, “religious

ethnicity” shows how religious behaviors could influence ethnic groupings.

Occasionally, ethnic religiosity has been equalized with “cultural religion,” which was perhaps first used by Demerath to argue that cultural religion “involves a label that is self-applied even though it is not self-affirmed. It is a way of being religiously connected without being religiously active. It is a recognition of a religious community but with a lapsed commitment to the core practices around which the community originally formed. It is a tribute to the religious past that offers little confidence for the religious future” (2000). He later argued that cultural religion was “an identification with a religious heritage with no religious participation or a sense of personal involvement per se” (Demerath 2003, p. 59). The core argument in Demerath’s view highlighted a nominalism, in which a name suffices for a person religiously. Cultural religion relaxes with a name while emphasizing no practice.

Implications of Ethnic Religiosity

Ethnic religiosity refers to a state in which a believer’s mentality filters religious acts through ethnic lenses, thus providing an ethnicized version of understanding toward the authenticity of religious practices of other co-religionists. Put it differently, ethnic religiosity is an uninformed state of assuming one’s *ethnic* religious acts more authentic compared to that of other fellow co-religionists of other ethnic backgrounds. Takim, for instance, reported some minority Muslim groups in the USA found their religious acts more *Islamic* compared to that of other practicing members (Takim 2009). Interestingly, both minority groups of Muslims, in this case, belonged to the same tradition in Islam, and they only differed in their ethnic backgrounds.

Revisiting Demerath’s “cultural religion” framework, one could notice that an informed state of religiosity means not taking a self-position for granted, or not to assume one’s position as the ultimate truth. Theoretically, an informed state of religiosity could mean any scholarly attempts,

which might involve re-/searching for what a person does ethnically. An uninformed state of religiosity could manifest a version of religiosity that does not have much religious content or, ironically, could be atextual, acanonical, or even sacrilegious. Here, ethnicity, through which religiosity renders, eases such practices as more authentic.

Of note is that cultural religion follows an *inclusive* approach in which a name (e.g., being Muslim), and not the practice, suffices as an umbrella for the people to identify with a religion, and with one another. Yet, for ethnic religiosity, the mechanism is *exclusive*. A person’s ethnic practices, and not the name, authenticate their religiosity and automatically label other ethnicities as less authentic. Followers of ethnic religiosity favor their ethnic practice as the most orthodox style of practice. In this manner, co-religionists of other ethnic backgrounds stand outside the circle of orthodoxy, and would normally become otherized, if not alienated.

Ethnic religiosity stems from validating religious beliefs through an ethnic prism. Ethnicity, an uninformed state, validates religious deeds. Ethnic religiosity, in this manner, stands against scholarly religiosity. Thus, fellows in an ethnic group would always assume their orthodoxy in terms of behaviors and deeds. With ethnic religiosity, practice is present; yet, it normalized itself through ethnic mentalities, which simply otherizes other religious practices that occur outside of one’s ethnic enclave.

Etiological Myth

Alice Mills

University of Ballarat, Ballarat, VIC, Australia

Etiological myths are those myths that explain origins and causes. Creation myths are etiological, explaining how the universe or the world or life in the world came into being. Etiological myth does not have to situate itself at the beginning of all things; it can account for the creation of a new entity or activity within the established order of creation, just as much as for the creation of an ordered world out of primal chaos.

Religion

Religions can be set along a spectrum from those primarily focussed on beginnings, on events

within an established universe, and on endings. Although “etiological” is a term derived from classical Greek (*aition* meaning cause), the belief systems of classical Greece were oriented more to the afterlife, and most of their etiological myths concerned particular places and rituals. The Roman poet, Ovid, collected a large number of etiological myths of transformation in his long poem, *The Metamorphoses*. Such myths as Daphne's transformation into the laurel were popular material for medieval and Renaissance writers and artists to interpret allegorically as intimating Christian truths. The Bible stories span the whole spectrum from creation to last things. The first part of the Bible, *The Book of Genesis*, offers etiological explanations for the creation of the world and its inhabitants, the origin of death, fear and hatred of snakes, and the pangs of childbirth, and the Noah story explains the origin of the first rainbow. An example of a religion tilted almost totally towards etiology is the Australian Aboriginal people's Dreamtime, whose stories provide explanations for the origins of features of the landscape, its inhabitants, and their behaviors. While Dreamtime stories speak of a time outside chronological time, those who still hold them sacred believe that the beings of which they speak still inhabit the land. Dreamtime etiological belief is taken into serious consideration by contemporary Australian Governments in legislating for commercial and recreational use of the land.

Science

While the origins of the universe are currently not fully explicable in scientific terms (and perhaps never will be), such phenomena as the rainbow, geological features of the earth, and lunar eclipses have been well understood scientifically, so much so that scientific explanations have long been used as weapons to discredit myth in general via its etiological function. Romantic poets such as Keats and Wordsworth bewailed this triumph of the rational mind over what the poets saw as the truths of the imagination and soul. In the nineteenth century, believers in the literal truth of the Bible struggled with the challenges offered by

science. The battle between proponents of the Darwinian theory of evolution and the creation story in Genesis still rages.

Psychology

Psychologists who claim that their discipline belongs among the sciences have no interest in exploring etiological questions about the psyche, preferring close observational and experimental scrutiny of the ways in which children develop. Most psychoanalytic theorists also focus on the development of the individual psyche rather than its mysterious prehistoric origins. Post-Jungians tend to ignore Jung's own speculations about the prehistoric development of human consciousness. With the exception of Julia Kristeva, who terms this part of his work the "Freudian fable," post-Freudians say as little as possible about Freud's own etiological mythmaking in *Totem and Taboo* and *Moses and Monotheism*, where (with some proviso about the difficulty of exactitude) he offers as literal truth a tale about the primal horde, the first slaughter of a father by his sons, and the guilt-ridden origins of sacrifice. Freud regards all later religions as attempting to resolve the filial sense of guilt. His primal horde tale offers an etiology not only for world religions but also for all human civilizations and the neuroses that afflict the human psyche.

Evangelical

Elisa Bernal Corley
Castaic, CA, USA

The term evangelical is a derivative of the Greek word *euangelion*, which literally means “good news” or “gospel.” It is used to identify the four books of the New Testament that narrates the good news of the life, death, and resurrection of Jesus Christ. The earliest usage of the term “evangelical” seems to be from Tertullian’s writings (c. 155–222), where he referred to the “evangelical and apostolic writings” as authoritative for the life and practice of the church.

Historically, the term evangelical was first used to refer to those who were part of the reforming parties in Europe before 1529. In the 1520s, it became popular in the polemical writings of early Reformers. During the Reformation period, an evangelical is one who believes that the Catholic Church should return to the beliefs and practices supported by New Testament Christianity. An evangelical emphasizes piety and righteous living, expressed in strict ethical codes, instead of adherence to external legal rules enforced by the Church.

Contemporary evangelicals share basic convictions inherited from their Reformation family, including the authority and sufficiency of the Scriptures, the necessity of salvation in Jesus Christ because of human sinfulness, the doctrine of the Trinity, belief in the resurrection and divine judgment, and the urgency of evangelism.

While the face of Christianity is rapidly changing, with the center of evangelical Christianity moving towards Asia, Africa, and Latin America, perhaps the strongest expression of modern-day

evangelicalism is found in the United States. Because of the swift transplantation of evangelical beliefs and practices to the colonies, in Anglo-American history, the term evangelical now refers to a wide variety of groups, ranging from the major Protestant denominations like the Baptists and Presbyterians to Roman Catholics and to evangelical associations like the Billy Graham Association. In many parts of Europe, Asia, and Latin America, the word is often used synonymously with Protestant groups as distinguished from Roman Catholics.

Commentary

While present-day evangelicals share basic beliefs, interpretations may vary depending on where they locate themselves along the evangelical spectrum. When nineteenth-century science began to challenge the authenticity of the Bible and the credibility of Christian teachings, evangelicals found themselves divided. In response to what was perceived as a scientific onslaught on the Christian faith, traditionalists separated themselves from those who adopted a critical approach to the study of the Bible. Those who tried to adapt to the larger and more pluralistic culture, believing that there is no quarrel between the truth of religion and the discoveries of science, were considered liberals and modernists.

Each group adopts a distinct approach to answering the question of how one enters into and remains within the Christian life and communion. Although they share the belief that entrance into the Christian life is through faith in Jesus Christ, within the conservative branch, especially among the self-described “born-again Christians,” a conversion experience is the definitive moment of entrance into the Christian life and the Kingdom of God. Conversion happens through repentance of one’s sins and the acceptance of the forgiveness through Jesus Christ.

A definitive conversion experience meant that a person’s identity is changed by God’s grace. It is reshaped and transformed from the “old” into the “new.” With the new identity comes the adoption of new ideals and practices, which are often

expressed in strict moral lifestyle, immersion in the life of the community, and fealty to religious teachings. Furthermore, this transformation of identity is accomplished through continuous participation in the ritualized practices of the local community like prayer, bible studies, small-group fellowships, and corporate worship.

Even though conservative evangelicals are found to hold disparate, nuanced, and diverse views on political and social issue, in general, they view the teachings of the Bible as sufficient to answer life’s problems and questions. The believer recognizes and submits to the authority of the Bible and the ordained leaders of the church. Because biblical teachings are authoritative for Christian life and practice, and because of the belief that the Holy Spirit guides the believer into obedient faith, conservative evangelicals are distrustful of any naturalistic explanation of human experiences. If human psychology could explain and improve human behavior without the need for spiritual intervention, then belief in the power of God to influence human life becomes expendable.

The authoritative and supernatural place of the Bible and the role of the Holy Spirit in the life of the community also serve as inoculation against outside criticism. Since there is an external source of authority to which members defer, the believer tends to have a diminished sense of personal autonomy and power. Questioning a belief or doctrine using other intellectual tools may also produce guilt. Finally, even though there is evidence that active participation in church life and commitment to religious tradition promotes a believer’s psychological well-being, adherence to the prescribed moral code of the community could make it difficult for a believer to adapt to situations or subcultures that do not share her beliefs.

Meanwhile, evangelicals who had been influenced by the American civil rights and anti-war movements, as well as the advances in higher education, had come to adopt liberal views on political issues. Evangelical scholars who are interested in engaging the human sciences can also be found in some evangelical colleges. Many of these modern-day evangelicals have assimilated several central features of the

dominant American culture, especially those pertaining to individual autonomy and tolerance of diversity. With a more positive view of cultural and other human disciplines, they are therefore more comfortable with engaging the broader culture while at the same time maintaining close communion with their religious communities.

Within this multivocal evangelical community, there are those who welcome the use of cultural and scientific approaches in the examination of their faith. In exploring the Christian life, evangelicals with liberal leanings accept the complexities of human personality and development. Although the Bible remains authoritative, they do not expect it to provide the solutions to all of the unique challenges of modern living. They feel free to evaluate life choices using other tools for analysis and moral reasoning that extend beyond obedience to religious authority or tradition. They welcome the help of clinical therapists, for instance, with difficult issues like abortion, marriage, sexuality, work, and various psychological illnesses. Attempts toward the integration of theology and psychology reflect the openness of modern evangelicals to a progressive approach to the study of human development. Examples of such undertakings are expressed in publications like the *Journal of Theology and Psychology* and the *Journal of Psychology and Christianity*.

Everson, William

Steven B. Herrmann
Oakland, CA, USA

After leaving St Albert's Dominican Priory, a Catholic monastery in Oakland, California, where he had practiced as a lay monk, poet, and spiritual counselor, under the name "Brother Antoninus" for 18 years, William Everson disrobed himself of his religious habit after an electrifying reading at the University of California at Davis (UCD) campus and donned the mantle of a traditional Native American buckskin vest and Lakota bear claw necklace, and when I took his celebrated course, "Birth of a Poet," in 1979 at the University of California at Santa Cruz (UCSC), this is the way I first experienced him: a *poet-shaman*. It was Everson's humility, I believe, as a post-Christian monk that enabled him to wear this sacred mantle with an attitude of reverence, an attitude of modesty.

I say this in my opening statement of this entry because it is important to provide for the reader a sense of the poet's *presence* when I knew him. By the time I set eyes on him, Everson had already gone through two religious conversions: the first when he found his master, Robinson Jeffers, and

the second when he had his experience of spiritual conversion to Catholicism. The third conversion, which I will speak about later, is his change into a poet-shaman following a dream that called him to wear this new regalia. It was in the Dominican Order, as “Brother Antoninus,” that Everson learned the art of silent meditation and its importance in evoking the call to vocation, as it is “voiced” through dreams, visions, and ecstatic experiences.

After divesting himself of his friar’s robes after the UC Davis reading, Everson began to pay careful attention to his dreams and visionary experiences. During his period of change from Catholic lay brother to University professor at UCSC, he heard a calling from the Self and surrendered to its powerful summons; new rhythms of the American earth were summoning him to provide an answer to the world on the verge of spiritual rebirth at the cusp of the new millennium: to respond to a problem of how to live more harmoniously with the earth. Everson would play a pivotal role in helping to usher a new way of living in. (Today, we would call him an ecopsychologist). Everson’s response to his inner/outer summons was to teach his celebrated course “Birth of a Poet” on the UC Santa Cruz campus, between the Fall of 1971 and 1981, where he taught on the “vocational archetype” – a destiny factor in the dreams and fantasy thinking of his students. Everson’s way into this dimension of the psyche was mythopoetic. In 1980, Bill asked me to be his Teaching Assistant and lead dream groups for his course, where the aim was to help students locate their calling to vocation. This is the way I got to know Everson personally. I remained his close friend, until his death in 1994.

Everson was born in 1912, so the year 2012 happens to be his centennial year, the 100th anniversary of his birth, an occasion to rejoice and give praise for his life and work. I write this entry from my home in the wooded hills of Oakland, on the edge of Joaquin Miller Park, above the Dominican priory where Everson lived as a monk, before moving to Stinson Beach with his wife Susanna, and stepson Jude, where he wrote wild poetry on the Pacific coast. Everson found his final quaint home in the mountainous terrain of

Davenport, California, near Big Creek where steelhead still run today, where there are plenty of hawks, right beneath twin towering *sequoia sempervirins*, two redwood trees he dearly loved.

From Everson’s empirical research into the nature of dreams on the UCSC campus, he arrived at a place of personal and cultural transformation, from whence he could see across the vast course of human evolution in a new way; from a vista in the Native American cultural psyche, where the drumbeat and rattle of the shaman are experienced as the heartbeat of the nation. From this vantage point, he set out to chart a Post-Jungian Journaling method that could lead University students to discover the central factor of religious experience: the Self. His notion of the vocational archetype provided the way in. Out of his spiritual center – the calling – Bill spoke to students at UCSC in an effort to reconnect them again to the creative element in everyone: the earth, the air we breathe, forests, our national parks, and the great solitude of Nature. Everson taught students that we have to follow the “star” of our destiny to our place of emergence, our place of manifestation as human beings, our place of *visioning*, if we are to survive as a species.

As his Teaching Assistant, I would observe students coming in to the class somewhat sleepy-eyed and they would either sit or lie down on mats around Everson in the center of the room. He was always standing upright and pacing about, with his hand beating against his blue jeans in a rhythmic motion (he had Parkinson’s disease); he would speak, read, and recite poetry at the center of the assemblage with the large circle around him. Often students were in half-dream states. Mainly they would be in a relaxed state, so that the psyche could have an opportunity to be stimulated by whatever he was saying. Sometimes, during his reading of poems, you would get this feeling of an incredible electrical current, an energy charge, coming right out of him. It was quite extraordinary, what Rudolph Otto called the “numinous” feeling state.

Everson had tremendous integrity and he held an empirical attitude towards the dream journals and the final essays of the students. He and I would read them together and they were

sometimes quite eloquent. Language was Everson's way to approach the unconscious. Journaling was his method. As a Post-Jungian, who was "analyzed" by Father Victor White, in the Dominican priory in Oakland, he looked at dreams from an in-depth religious angle. Vocational dreams hold a potentiality, he taught, and have a *telos*; they are goal directed. He learned this from Jung. It is the student's task to discover what the vocation to Selfhood is.

Many students had vocational dreams, but how to bring the *calling* forth, to birth it, was the big question Bill left students with. How does one manifest one's vocation in one's life and bring it to birth? "Birth of a Poet" is the name he selected for his course and the confirmation of the call was its central aim.

As I have said, Everson was very modest about what he was observing. It takes a long period of time to do deep psychological work and to manifest its fruits, its alchemical gold. But Everson did most of his work himself, without an analyst. He was basically self-analyzed. Victor White merely led him to Jung's work. Despite his being virtually unanalyzed, it is my view that Everson made a significant contribution to Post-Jungian theory and to the new religion of the West. He did this from the literary angle as a poet, writer, fine press printer, and teacher. I view Everson as a Post-Dominican/Post-Jungian teacher, really, who contributed to our understanding of the *vocational archetype*, which he, and the Post-Jungian Journal workshop guru, Ira Progoff, developed primarily as a way to apply analytical psychological techniques to work with large groups of people, outside analysis.

Everson and I held office hours together, and sometimes students would come in on their own initiative and speak about their dreams with one or both of us and I learned a great deal from him. Everson was a vocational counselor, a spiritual counselor, and a Post-Jungian teacher. He distinguished between vocation and career in the following way: *vocation is where your motivation is, career is the impact of your vocation on the world*. Vocation is where one's deepest source of motivation is and it comes from the Self (that part of one that allows one to truly

expand and experience the cosmos), with a capital S. "Where is the expansion point in your personality, the point of transcendence?" Everson asks us to consider. This is what he was seeking.

When Everson spoke about the vocational archetype and its impact on individuals and the world, he was really speaking about that innate expansive potential in each of us. The important distinction he made between vocation and career is the impact of vocation on the world. Career has to do with one's relationship to collectivity, group consciousness, culture, and the nation in which one lives; it is the impact of one's work on the outside. It is not an occupation. An occupation is really what we do for a living. It may not coincide with vocation, but it may be how one makes money. Vocation on the other hand relates to the notion of psychological and spiritual transformation because this is what vocational dreams do for us: they transform consciousness by *electrifying* us!

This electricity metaphor is basic to psychic energy, which, now with modern physics, we see that electromagnetic energy is present in atoms. Everson taught that one can access this source of psychophysical energy through writing, if one can find a way to tap into it. Everson's genius is that he had the intuitive insight to structure his course at UCSC so that he could open the way up for students at the early adult career transition to experience this. I experienced it first hand: Everson had an ability to activate the vocational archetype in student's dreams, in a way that was delightful. He had a unique ability to lead the active listener – the student – into a state of trance, or active visioning. As a Post-Jungian poet, Everson made transubstantiation through the vocational archetype transparent for us.

If one wants to know what one's vocation is, Everson instructed, look to the archetype. It is the archetype of vocation that makes all work sacred. All the great world religions and philosophical systems have their unconscious source in this archetype. Psychology is no exception to this rule, he taught. And all vocations, concerned with the preservation and protection of life on our planet, are ultimately united in a shamanic

ground of existence, an indigenous source. Whether in the field of politics, agriculture, or art, Everson believed all vocations are concerned with maintaining a connection to a shamanic mode of existence.

Everson maintained a Christian attitude of humility under the mantle of poet-shaman, yet, as I said, when he read poetry on platform, he was a lightning shaman (Herrmann 2009). I don't say this lightly! The presence of the man, when he stood on platform, was simply awe inspiring! I can only speak from my personal experience here: his voice was spellbinding. During such moments when he read the envoys of divinity spoke through him, I *felt* it in every fiber and fabric of my being. Everson was not only a religious poet; he was a teacher, who advanced Post-Jungian notions, based on his direct empirical experience, as an instructor and dream researcher. Some of his classes had 400 students enrolled at a time and by the time I took his course in 1979 I had to grab a class card from his hand so I could enroll. If I had not done that, my life would have taken a different direction.

I can remember, while sitting in a circle on the mats, with 100 students (UCSC eventually limited the number of students to 100) and hearing him read his poems, one in particular lit me through. This one was written during his Catholic period, and it is called "The Encounter." It describes his second conversion experience. Part of it reads like this:

.... My Lord came to me in my depth of dross;
I was as woman made and hung with shame.
His lip sucked up the marrow of my mind,
And all my body burned to bear His name.
Upon my heart He placed His pouring pain;
I hung upon him as the albatross
Hangs on the undering gale and is sustained.
My Lord came to me and I knew, I knew.
I was a uselessness and yet He came
Shafted of the center of the sun.
I was a nakedness and was of shame;
I was a nothingness and unbegun.
The look He leaned upon me lit me through.
(Everson 1998, p. 80).

The idea of being "shafted of the center of the sun" suggests an experience of being burned pure with the brilliant shaft of psychic energy, and this

I took to be equivalent to an experience of being struck internally by lightning, a direct experience of the Self.

This was Bill's second conversion. His first conversion came to him while he was a student at Fresno State University and pulled down by chance or meaningful coincidence (Jung's notion of "synchronicity" to which Everson ascribed) a book from the shelf, by the Carmel poet Robinson Jeffers. Everson speaks about this experience in depth in his book *Fragments of an Older Fury* as a type of "spiritual osmosis" that came over him suddenly, "something like the Oriental relationship of the sybarite to the guru":

What I sought was a presence, a spiritual and psychological substance. The force from his pages hit me as something almost physical... When I encountered Jeffers it was essentially a religious conversion, my first one. Not only so, it was the intellectual awakening. For the first time I grasped the corruptness of man and the reality of an Absolute against which that corruptness must be measured. For the first time I knew there is a God, and I knew where I was going to find Him – before my very eyes, as He is bodied forth in prime Nature. And I knew that place no longer had to be the Lake Country, or Nantucket, or fish-shaped Paumanok, or the Mississippi. The place was California, the coast. I saw that he was intensely, incredibly alive in my own region (Everson 1968, p. 4).

Everson's work in "Birth of a Poet" became his laboratory for an investigation into the nature of the vocational archetype. His research led him to make some chief discoveries, particularly in the area of one's spiritual calling. Today, looking back at his life 100 years after his birth, I would venture to say that after Whitman, Melville, and Dickinson, he was one of the most important poets America has yet produced. In many ways, Everson caught the spirit of Whitman's vision of the "poets to come" in "Song of the Redwood Tree" and created a sacred ritual for students to realize Walt's dream, each in one's own way. By recourse to the dream life and by listening, in silence, to the sequence of his meditations on the Santa Cruz campus, overlooking the Monterey Bay, beneath giant redwood trees and the open sky, students were open to a direct experience of the cosmos. What gave Everson the power to transmit his notion of vocation as a way to God

so clearly was the power of the West Coast as a region.

Archetype West: the West Coast as a Literary Region was written at Stinson Beach between February of 1970 and February of 1971. The reason this book is so significant for purposes of my entry is that it was written just before he taught “Birth of a Poet” in the fall of 1971. His idea of the Western archetype is a fascinating notion as it unites his views on Post-Jungian psychology and religion: what it *means* to be a Pacific Coast poet. *Archetype West* was not published until 1976, and Everson asks certain questions in it that are quite illuminating. Basically, he asks the following: “What does it mean to be a Western writer?” “What is the archetype of the West that is dreaming us?” “Who are its greatest literary exponents in California and Oregon?” and “What role has depth psychology, primarily the psychology of C. G. Jung, played in helping to define it?”

Everson wrote the book at the same time he wrote two pivotal poems: “Black Hills” in May 1971 and “The Scout” in June of that same year. This is an important period, because this was right before his teaching of “Birth of a Poet,” and as I say in our book (Herrmann 2009) this Post-Jungian course was essentially structured upon the pattern of the Native American *vision quest*.

Everson felt that his situation and that of other California writers, at the far end of the West, was the term of the Westward migration, which “places him [Western writer/poet/printer] at the center, rather than on the periphery, of the American experience” (Everson 1976, p. xiii). And pantheism “is not only the basic Californian or Western point of view, but is essentially American, is indeed *the* characteristic religious and aesthetic feeling” (Everson 1976, p. 7). Everson makes another point that is vital here in considering his contributions to this Encyclopedia of Psychology and Religion and, that is, that the Western writer is “more in line with the perspectives of the American Indian and hence closer to the roots of the land” (Everson 1976, p. 8). This explains Everson’s adoption of Native American artifacts in his religious persona – his bear claw necklace was quite impressive and the buckskin vest that he wore was also a beautiful artifact to behold.

Everson told me that after a dream, which took place in the Black Hills and forms the background for his third conversion experience – his calling to shamanhood – he went to a little shop in Mill Valley, after finishing *Archetype West*, and found these artifacts there and decided he was going to wear them during his teaching at UCSC. The calling to wear Native American regalia is something that was “in the air” in the collective psyche, as Everson pointed to Gary Snyder as perhaps the most popular California writer who answered the shaman’s call for a new breed of earth poetry.

Although Everson modestly claimed to have been unread on the subject of the Western American novel, he welcomed the publishing venture to write *Archetype West* as a personal opportunity for him to recover “taproot.” While living on the edge of the Pacific Basin, he says the root energies of his vocation as a Western poet were unleashed out of his instinctive foundation and what followed is some of the best writing America has produced. The essay claims to be nothing more than a tentative probe into the underlying ethos of the Western locale, after two centuries of national experience on this continent. The book proves, however, to be much more than that. I view *Archetype West*, now long out of print, as one of the most important literary documents in American literature; it defines the central characteristics of the Pacific Coast like no other book of its kind. In Everson’s attempts to define what is unique about the Far West as a literary locale, he chose the most powerful centering device available to him at that time, namely, the “symbolic configuration of archetypal force” (Everson 1976, p. x), C. G. Jung’s hypothesis of the *archetype* (p. xi).

Archetype West was Everson’s first significant book of prose signaling his emergence as a Post-Dominican/Post-Jungian writer. Everson was introduced to Jung’s writings in the 1950s. This was a time of momentous change in American poetry. Allan Ginsberg published his masterpiece “Howl” in 1955, during the centennial year marking the publication of Whitman’s *Leaves of Grass*, and the beat generation was about to emerge onto the San Francisco literary scene, with Everson as the movement’s most prophetic figure.

As I noted above, it was Robinson Jeffers who gave Everson his pantheism. “I thought: My God! How *pre-Christian* his mentality is!” (Everson 1968, p. 27) Everson hypothesized that the Western archetype can be *experienced* best by way of its emotional resonance, *energy*, radiance, or soul power (Everson 1976, p. xiii). Grasping the *root* forces of this realization he began to speak forcefully out of what he calls the “mystery of place” (Everson 1976, p. xiii), and this is the kind of root energy he brought to his teaching in “Birth of a Poet.” California writers feel their situation at the far end of the West, he says as the “*term* of the westward migration” (Everson 1976, p. xiii). Although *Archetype West* positions Whitman and Jeffers to appear as if they were opposites, Everson nevertheless reconciles their apparent contradictions by asserting: “Both in cosmic outlook and in originality of style they stand shoulder to shoulder, or rather back to back, since they look in opposite directions” (Everson 1968, p. 37). Everson viewed Jeffers’ apotheosis as the secret quest and inner impulse of democracy itself (Everson 1976, p. 15).

In literature, Everson wrote the archetype “is always trying to find its vehicle, its voice” (Everson 1976, p. 23). His intuition is that the Western archetype found its first voice in the epic poetry of Herman Melville’s *Moby-Dick* and Walt Whitman’s *Leaves of Grass* (Everson 1976, p. 23). In some ways, he writes, the Western archetype spoke in Melville and Whitman “more evocatively than it would ever speak again” (Everson 1976, p. 25). Everson’s central thesis, however, is Whitman’s vision of the “poets to come,” and he includes the writings of John Muir in this. It was “Muir fighting for the preservation of the Hetch Hetchy,” he says, “that elevated the implicit recognition of the divinity of nature to the most explicit testimonial.” “Dam Hetch Hetchy?” Muir asks in a widely quoted document that struck a keynote in the spiritual and psychological conscience of the nation, “As well dam for watertanks the people’s cathedrals and churches, for no holier temple ever existed in the heart of man” (Everson 1976, p. 53).

This is the historical moment, according to Everson, that marks the “main turning point in the spiritual life of the nation, perhaps the chief turning point, as far as the future was concerned” (Everson 1976, p. 53). For, according to Everson, this battle enabled Jeffers to take Muir’s intuitions about the divinity of Nature further. In Everson’s words: “he [Jeffers] assails all the American assumptions with the massive right of his invective consciousness—American optimism, American service, American wealth, American power” (Everson 1976, p. 69).

In concluding I do feel, as Everson’s friend and colleague and collaborator, that the most precious gift he left us with, as a nation and a world on the cusp of ecological spiritual awakening, is a method for realizing the Self, as an immediate religious experience, via the keeping of a dream journal. No doubt, Ira Progoff played a role in popularizing Post-Jungian Journaling techniques in America and across other nations of the globe, and he came to his hypothesis of the *dynatype* (or vocational enacting image) before Everson did, but Everson’s way of evoking this central archetype of totality in the personality was more immediate, more forceful, and more psychologically alive, in the sense that his presence on platform, while reading poetry, was more electrifying. Let us celebrate, in this 100th year of his birth (1912–2012), then, California’s great poet.

When I helped carry his coffin, at the Dominican cemetery, in Benicia, California, in 1994, with his brothers, students, friends, and family of all walks of life, hand in hand, I sensed, deep down in my bones, that I was walking in the living memory of a Holy Man. The great Oglala Sioux shaman, Black Elk, would have found in him a brother.

Evil

Lorna Lees-Grossmann
Department of Psychosomatic Medicine,
Klinikum Rechts der Isar, Munich, Germany

There are two commonly accepted types of evil: first, the cosmic or natural evils such as fire, flood, earthquake, hurricane or epidemic, the sort discussed in the Biblical *Book of Job*. Secondly, there is interpersonal evil, man's inhumanity to man, on an individual or a large scale, murder or genocide. The first sort has a metaphysical cause and blame cannot be ascribed: these things happen and one must accept them. The second has connotations of innate malignancy and is bound up with theology and psychology and is the one under discussion.

Evil has an archetypal quality: theistic religions have an inherent dichotomy between good and evil. Loki's malice brought down the Norse gods; Lucifer's hubris brought about his expulsion from heaven and man's expulsion from Eden. What characterizes the religious explanation of evil is that the agent chooses the course of action that leads to whatever undesirable result awaits. Evil requires deliberate choice and action, whereas accidents are caused by an unwitting, nondeliberate agent. We can see this echoed in legal circles today in the distinction between

murder and manslaughter and the relative leniency of sentencing for the latter.

Relativism

The modern convention is that evil is relative. As Hamlet says, "There is nothing either good or bad, but thinking makes it so" (Shakespeare, *Hamlet*, Act II, Scene 2). The question is whether evil is a necessary or a contingent attribute. Is it the person, or the action, which is evil? The social construction of evil permits anyone to perform an evil act, but whether that action renders that person irredeemably evil is open to debate. From social experiments like Milgram's experiment and the Stanford Prison experiment, we can see that ordinary people have the capacity to perpetuate evil acts and that the likelihood that they will do so is increased if they are given implied or articulated assurance that they will not bear responsibility. Authority may be diffused so that the giver of the order takes sole responsibility and thus absolves the actual agent of blame or the target group may be deindividuated ("the prisoners") or dehumanized, as with Rwanda's "cockroaches," as the Tutsis were labeled during the genocide. On the macroscale, genocide can be perpetuated through the socialization of the next generation to hate the target group and the dissemination of propaganda to ensure that hatred is continuous.

Necessary Evil

M. Scott Peck articulates this non-equation of evil actions with necessary evil. He defines evil not by the committing of evil actions – because if this were the case, he argues, we would all be evil – or by the magnitude of evil committed. What makes a person inherently evil is self-deception and a lack of self-control; in psychiatric terms – pathological or malignant narcissism – evil is a form of mental illness. It is doubtful whether evil can be so neatly pigeonholed, and there is an obvious case for labeling all psychopathology as entailing evil because it also entails deliberate and serious human suffering. The other problem with this

interpretation is that it does not allow for the possibility that a person who performs repeated and deliberate acts of evil may also be capable of performing repeated and deliberate acts of good.

A more humanistic interpretation can be found in Rollo May, who offers a construction of evil in terms of agency. There are contributory factors such as war and interpersonal relationships or pressure at play, and there may indeed be an inherent evilness in each human – Jung’s “shadow” or the daimonic – but what is key is the role the individual takes in choosing to perform the act. While psychopathology might entail evil as a necessary feature, human psychology allows for contingent, temporary evil.

Evolution and Religion

Zach Simpson
Philosophy and Religious Studies/Religious
Reconciliation, The University of Science and
Arts of Oklahoma, Chickasha, OK, USA

For many, the relationship between evolution and religion is either antagonistic or quietistic (cf. Barbour 1997). In the former category,

individuals and groups from both the sciences and religion treat the other as participating in a form of discourse that violates a core principle of either science or religion. Examples of such a relationship in popular discourse are sundry: from the outright dismissal of religious claims found in individuals like Sam Harris (2005) or Richard Dawkins (2008), to the dismissal of evolutionary theory or its foundational empiricist monism, found in, for example, the Southern Baptist Convention (1982). The latter category, quietism, draws on Stephen Jay Gould’s conception of religion and science as “nonoverlapping magisteria,” wherein both fields of discourse are seen as separate and distinct levels of inquiry, one metaphysical and one staunchly empiricist. Variants of such a relationship are found in thinkers as diverse as the German-American theologian Paul Tillich (2001), philosophers of religion such as Phillips (2001), or many believers themselves. Either form of relationship, though, does not see the interaction between science and religion to be either fruitful or desirable.

Insomuch as the antagonistic or quietistic models foreclose discussion between evolutionary theory and religion, they also do not provide constructive or interesting models for a possible relation between the two fields. In this spirit, many have proposed that there are at least two other potential modes of relation between religion and science, namely, those of appropriation and mutual dialogue. Both categories are capable of capturing a number of interesting and novel forms of dialogue between evolution and religion, either in the form of scientific explanations which include religion as their chief source of inquiry and data or religious explanations which employ scientific data (namely evolution) for religious reflection. These two forms of dialogue are given in the discussion below.

Evolutionary Accounts of Religion

In the past decade, considerable research has been undertaken to examine the evolutionary status of religious beliefs. Research from anthropology, sociology, neuroscience, game theory, and

psychology has attempted to explain both the individual and social role religion has played in human evolutionary development.

Paradigmatic individualist accounts of the evolution of religion can be found in the work of Pascal Boyer (2002), Scott Atran (2002), and Jesse Bering (2011). For both Boyer and Atran, religious beliefs are tied to the psychological capacity to imagine other agents which are both causally related to the world around us as well as possess the capacity to know relevant social information. In this way, religious belief acts in both an explanatory and socially significant way, altering the behavior of individuals in both small and large groups. This is reinforced by the way in which certain beliefs have “traction” with our brains; in a study conducted by Atran (2008), those beliefs which were “minimally counterintuitive” were found to have the greatest resonance in both memory and salience over time in small children. It is worth noting that, for both Boyer and Atran, religious beliefs did not evolve to meet an evolutionary need per se; rather, religious beliefs take advantage of evolved mental characteristics such as theory of mind and social transmission. This explanatory direction is furthered in the recent work of Jesse Bering, who examines the ways in which theory of mind allows for the formation of God concepts, the attribution of agency to otherwise banal events (he cites, for example, the French movie, *Le Ballon Rouge*, where the protagonist, a little boy, and the audience imbue a red balloon with mental characteristics), the creation of a narrative psychology, and the discovery of purpose within existence. As in Freud’s *Future of an Illusion*, God concepts – such as explanations for traumatic events – are seen as a form of wish fulfillment in the work of Bering, as they co-opt certain evolved mental capacities and the desire for explanation.

In these and other more individualist approaches, certain themes emerge regarding the interaction between science and religion. First, though with some differences, researchers see religious beliefs as stemming from, or dependent upon, evolved mental characteristics responsible for agent attribution, theory of mind, or anthropomorphism. Secondly, the beliefs generated through such mental processes generally serve the more

existential and epistemic functions of self and group enhancement, explanation, and narrativity.

Alongside such accounts are found hypotheses which examine the social dimension of religious beliefs and the ways in which religious ideas generate prosociality, solve problems of cooperation, or enhance in-group/out-group tendencies. A thought experiment using economic game theory conducted by Dominic Johnson and Jesse Bering (2006), for example, concluded that the concept of divine punishment may promote cooperation and prosociality in large groups, as God concepts provide the specter of both unlimited observation and punishment. Similarly, experiments by Norenzayan and Shariff (2008) found that individuals given religious cues in economic games were more likely to give money to others than participants given nonreligious cues. The same study also found that religious concepts often promote trust and cooperation between unrelated individuals.

Other prosocial aspects of religious beliefs, particularly with respect to group persistence over time, have been extensively examined by Richard Sosis (2004). In one study, Sosis found that groups with greater religious demands (e.g., prescribed prayer, dietary restrictions, sexual abstinence), which he terms “costly signals,” increased religious group persistence over time relative to groups with fewer or nonreligious ritual demands. In other work, Sosis found that the group performance of prescribed rituals, such as prayer, promoted cooperation and giving in economic games (similar to those performed by Norenzayan and Shariff) between members of Jewish *kibbutzim* (Ruffle and Sosis 2007).

The physiological dynamics of these collective aspects of religious belief are exemplified in recent studies which examined a fire-walking ritual in Spain. There, researchers demonstrated a phenomenon known as “collective effervescence,” wherein both spectators and participants experienced synchronous arousal (i.e., elevated heart rate) and common memory recall of the event (despite initially differing accounts; see, for example, Konvalinka et al. 2011). This research demonstrates that there is likely a physiological foundation for collective religious rituals which strengthen group dynamics and forge a common identity amongst participants.

Taken together, recent research on the collective value of religious belief demonstrates that religious concepts may have evolutionary utility inasmuch as they promote group cohesion, cooperation, cost-free detection of free riders, community persistence, and even outwardly directed violence. Taken alongside the more individually oriented evidence presented above, the relationship between evolution and religious belief appears to be one in which religious beliefs depend upon certain physiological and cognitive adaptations, which in turn confer positive social and selective benefits upon both individuals and groups.

Religious Interaction with Evolutionary Theory

Interesting forms of dialogue between evolutionary theory and religion can also be found within theology and the exploration of religious experience. Within the Abrahamic traditions, there is a clear history of theological reflection on the natural world, wherein natural phenomena are seen as indicating the goodness and providence of God. St. Thomas Aquinas, in his *Summa Contra Gentiles*, for example, made one of his “five ways” to see the existence of God dependent upon the revelation of the natural world, a proof he inherited from Muslim thinkers such as Ibn Sina (Aquinas 1999). Later, early modern scientists such as Robert Boyle saw the natural world as revealing of God’s handiwork (Boyle 1691/1692).

Though heavily politicized, I would argue that the recent intelligent design movement (e.g., Dembski 2002) draws on this natural theological tradition, inasmuch as it attempts to use evidence from the natural world to argue for the immanent creative activity of God. Similar to the natural theological tradition seen in Aquinas and Boyle, intelligent design does not deny evolution on the micrological or macrological scale; rather, it attempts to show that certain body forms could not have been created without divine influence, as they are “irreducibly complex.” This form of religious appropriation is consistent with much of the Christian theological tradition.

There are numerous other approaches, however, which have given even more epistemic

ground to the sciences. Recent work by Sarah Coakley (2008, 2009), in conversation with evolutionary game theory, examines the evolution of cooperation in animals and humans throughout evolutionary history. This history, she posits, shows a minimum providential plan for creation in which prosociality, love, and altruism are allowed to develop naturally over evolutionary time. Coakley’s theology (much like Aquinas), while clearly conceding considerable ground to the sciences, attempts to show the ways in which data from the sciences, particularly the evolutionary modeling of cooperation in large groups over time, points to the beneficent creative process envisioned by God.

Perhaps the clearest example of granting epistemic primacy to the sciences can be found in recent “emergence theologies,” exemplified by theologian Philip Clayton (2008). For Clayton, evolution is to be seen as revealing various scales of irreducible complexity, such that chemistry is irreducible to physics, biology is irreducible to chemistry, and so on. In this way, the natural world consists of multiple levels which are both dependent upon each other and yet also independent. Each level also exhibits causal agency. Clayton, employing this model, sees God as a “level” of emergence analogous to human consciousness. Or, in other words, God emerges out of (and is prior to) the world just as cells emerge out of complex chemical interactions.

Clayton’s theology represents an extreme along the continuum of theological reflection as it not only uses scientific data for theological reflection, but gleans the primary theological metaphors and intuitions from the sciences themselves. In this way, evolutionary theory becomes both the datum and foundation of theological reflection. As a result, and as Clayton concedes, as evolutionary theory changes, so too does theology.

There are, of course, other theologies which deal explicitly with the sciences, either through appropriation or mutual dialogue. Arguably, though, each exists along the continuum traced here between (a) the revelation of God in the operation of nature, (b) the use of evolutionary theory as evidence for God, or (c) the use of evolutionary theory as a store of metaphors

through which we can understand God. Each differs in the degree to which it accepts or allows for evolutionary theory to dictate the language and conclusions of theological inquiry.

Finally, the epistemic openness exhibited in the work of Philip Clayton can also be found in recent accounts of religious experience by Wildman (2011) and Taves (2011). For both figures, religious experience is no longer seen solely through the lens of either firsthand accounts or religious institutions, but is treated through a variety of perspectives, including phenomenology, sociology, and neuroscience. Such approaches, as Taves notes, contest the self-evidence of religious experience and open such experiences to multiple forms of interpretation, including evolutionary psychological accounts.

Conclusions

The relationship between evolution and religion is often seen as contentious or indifferent. Though for many this may be the case, there is considerable contemporary research which benefits from a mutual dialogue between the sciences and religion. In the sciences, research which takes seriously both reported beliefs and the perceived benefits of religion has allowed for religious belief to be seen as a multifaceted way of being that draws upon physiological, neurological, and social inputs. In religion, those theologies and accounts of religious experience which take seriously both the methodology and conclusions of the sciences have a greater store of forms of interpretation upon which they can draw for religious reflection. For both fields, an increase in what constitutes evidence has allowed for new insights into both evolution and religion.

Existential Guilt

Louis Hoffman

Saybrook University, Oakland, CA, USA

Existential guilt, which is sometimes referred to as ontological guilt, is a guilt rooted in one's existence that may take several forms. Rollo May (1958) identified four primary characteristics. First, existential guilt is universal, or something that everyone experiences. Second, it is not the result of cultural norms or prohibitions, but rather is rooted in the reality of self-awareness. Third, it is distinct from neurotic guilt, though holds the potential to become neurotic when it is denied or repressed. Fourth, it includes constructive potentials when engaged directly or creatively.

May (1958) identified three types of existential guilt connected to different modes of being-in-the-world: *Eigenwelt*, *Mitwelt*, and *Umwelt*. *Eigenwelt* refers to one's own world and is innately connected with one's potential for self-awareness. Existential guilt in this mode is connected with forfeiting or not utilizing one's potential. This form of existential guilt is the one most prominently addressed in the psychological literature.

Mitwelt is the mode connected to one's connection with other human beings and is related to the social or relational aspects of being human. It

should not, however, be confused with real or neurotic guilt. Real guilt results from an actual harm or transgression that impacts another whereas neurotic guilt often results from minor or imagined transgressions (Yalom 1980). This form of existential guilt is aptly summarized by Tillich (1957),

The citizens of a city are not guilty of the crimes committed in their city, but they are guilty as participants in the destiny of [humanity] as a whole and in the destiny of their city in particular. . . They are guilty, not of committing the crimes of which their group is accused, but of contributing to the destiny in which these crimes happened. (p. 58)

This form of existential guilt calls all people toward social responsibility to others, even though the person may not have control over the outcome. This guilt, too, may be connected with complacency or inaction in the face of harm or evil, or in the participation in a system in which harms are being perpetuated without recognizing what one ought to recognize or voice concern about what one recognizes but may not be able to change.

The third form of existential guilt, which is connected to the *Umwelt* mode, May (1958) describes as the “most complex and comprehensive aspect” of existential guilt (p. 55). It is rooted in physical dimension of the world and connected with separation from nature or the natural world. This form of existential guilt connects to living responsibly in accordance with nature, including one's own body and the entirety of the natural world. As such, it can be connected with environmental and ecological responsibility.

The Productive Element of Existential Guilt

May's approach to existential guilt recognizes the potentially constructive effects of this type of guilt (May 1958). He notes it can lead to “humility. . . , sharpened sensitivity in relationships [with others]. . . , and increased creativity in the use of one's own potentialities” (p. 55). Yalom (1980), similarly, notes that existential guilt may be necessary for psychological well-being. From the

perspective of existentialism, guilt is necessarily connected with responsibility. When a person remains open to the experience of existential guilt, then they are able to use this to guide their behavior in the direction of living responsibly in relation to the three modes of *eigenwelt*, *mitwelt*, and *umwelt*.

Existential guilt in the mode of *eigenwelt* may motivate a person toward actualizing their potential. This compliments the concept of the self-actualizing tendency of humanistic psychology. While humanistic psychology emphasizes the more positive aspect of being drawn toward growth, existential guilt addresses the negative feelings that may accompany the denial or forsaking of that potential.

In the *mitwelt* mode, existential guilt is connected with social responsibility and one's desire to make a positive contribution to others. This aspect of existential philosophy and psychology is often misunderstood. Frequently, existential thought is misinterpreted as being primarily, if not exclusively, focused on the individual and the individual's freedom without consideration for the freedom of others (Flynn 2006); however, many existential perspectives recognize that one's own freedom and well-being is necessarily connected to the freedom and well-being of others. Tom Greening powerfully advocated for the constructive potential bound with existential guilt in the *mitwelt* mode:

I finally went to a concentration camp for the first time in my life last August. . . I wanted to do that, and am glad I did. It was a very powerful experience. It sort of felt like paying one's existential dues. . . That if you are going to be alive in the 20th century or the 21st century, that you are going to claim to be alive and had lived in that time, then what should you be aware of, or in touch with? . . . There's a whole bunch of existential facts of life that one ought to really deepen, embrace, or acknowledge, even feel existential guilt about. (as cited in Claypool 2010, p. 110)

In Greening's conception, this type of existential guilt can drive one to becoming a better citizen of the world.

Although May (1958) viewed the *umwelt* mode of existential guilt as the most comprehensive, he did not explore it with as great of depth,

including the constructive potential of it. In the contemporary context of global climate change and fears of crossing a point of no return with the environmental destruction that humans have caused, this type of existential guilt warrants further consideration. An awareness of this form of existential guilt can prompt an individual to being more ecologically and environmentally mindful through being conscious of one's carbon footprint, engaging in good recycling habits, and speaking to environmental issues being faced by the world today.

Conclusion

Ernest Becker (1973) noted that "the best existential analysis of the human condition leads directly into the problems of God and faith. . ." (p. 68). While today it might be good to broaden this to include spirituality in the list of problems identified by Becker, it is evident that the analysis of existential guilt leads one to the questions of religion and spirituality in each of the modes of being-in-the-world. In the realm of the *eigenwelt*, one's potential is recognized as God-given or connected to one's spiritual nature. In the realm of *mitwelt*, the one's responsibility to others is rooted in their spiritual nature or religious values. Finally, the existential guilt in the realm of *umwelt* calls one to be good stewards of the world and recognize one's connection to the world. While existential guilt holds the potential to negatively impact individuals when denied, repressed, or not recognized, it also holds the potential to draw one into responsible living. Existential guilt, in this sense, can be embraced as a gift from one's human nature.

Existential Psychotherapy

Stephen A. Diamond

Center for Existential Depth Psychology Los Angeles, Los Angeles, CA, USA

Existential psychotherapy is based upon the principles of both humanistic and existential psychology, the latter being a movement with roots in the existential philosophy and writings of Heidegger, Husserl, Merleau-Ponty, Ortega y Gasset, Dostoevsky, Kafka, Camus, Kierkegaard, Nietzsche, Sartre, Tillich, Marcel, Buber, and others. Otto Rank, Medard Boss, Ludwig Binswanger, Karl Jaspers, Eugene Minkowski, Ronald Kuhn, V. E. von Gebattel, J. H. Van Den Berg, H. J. Buytendijk, and G. Bally were among the first to apply existential principles to the practice of psychotherapy (calling it *Daseinsanalyse* or existential analysis) in Europe, followed prominently by Viktor Frankl (Vienna), R. D. Laing (London), and Rollo May, J. F. T. Bugental, Thomas Szasz, Frederick “Fritz” Perls, and Irvin Yalom in the United States. It was psychologist Rollo May along with psychiatrist Henri Ellenberger who, in 1958, introduced the European existential analysts to American clinicians in their groundbreaking book, *Existence: A New Dimension in Psychiatry and Psychology*.

Existential therapy is often misperceived as some morbid, arcane, pessimistic, cerebral, esoteric orientation to treatment. But in fact, it is an exceedingly practical, concrete, positive, and flexible approach. On any given day, an existential therapist might deal with mundane matters such as the patient’s financial crisis, marital problems, health issues, addictive behavior, or psychopharmacological needs, while at other times working with dream material, archetypal motifs, spirituality, grief, anger, or the patient’s creative process – all depending on the practitioner, context, and what seems most existentially pressing in the moment. Existential psychotherapy, despite its popularity in the decades following importation to the United States, declined dramatically toward the close of the twentieth century, a victim of the psychopharmacological, cognitive, and managed care revolution in mental health. But as consumers are increasingly confronted with the very real limitations of what managed mental health care, psychopharmacology, and cognitive-behavioral treatment can provide, existential psychotherapy is quietly enjoying a recent renaissance.

While existential psychotherapy is commonly seen as synonymous with the brooding, dark, despairing, nihilistic, atheistic intonations of European existentialism, it is crucial to differentiate the two: Existentialism is a philosophical movement, whereas existential psychotherapy is a psychological treatment. Existential psychotherapy was never intended to be a specific school unto itself, but rather a pragmatic, humanistic, holistic, corrective orientation to psychotherapy in general. “Existentialism,” explains Rollo May (1986), “is not a comprehensive philosophy or way of life, but an endeavor to grasp reality” (p. 59). The existential movement in psychiatry and psychology arose as a reaction against the reductionism, determinism, dogmatism, and hyperrationalism of both psychoanalysis and behaviorism. As May (1986) indicates, whenever you perceive a person merely as a particular diagnostic disorder, biochemical imbalance, genetic predisposition, or “as a composite of drives and deterministic forces, you have defined for study

everything *except the one to whom these experiences happen*, everything except the existing person himself” (p. 25).

The objective and subjective revelation of one’s own existence, the “I am” experience or sense of self, is an integral part of the process of existential psychotherapy. While the techniques of existential psychotherapy can include Freudian, Jungian, Gestalt, cognitive, behavioral, or other methods, the fundamental technique shared by all existential therapists is *phenomenology*. Phenomenology is based predominantly on the philosophical work of Husserl and Heidegger and refers to the setting aside or bracketing off of preconceptions, interpretations, expectations, bias, and rote intervention in an effort to discover the patient’s actual, unadulterated subjective experience, his or her being-in-the-world, and existence or *Dasein* (being there). It is through this phenomenological refraining from forcing the patient onto a Procrustean bed of preordained theory or methodology that the true experience of the patient at any given moment can be understood and appropriately responded to by the therapist. In its purest form, “the existential-phenomenological view does not construct any explanatory models but tries to understand situations by exploring the immediate experience [of the patient]” (Cohn 1999, p. 43). Dogmatism and doctrine are excluded as much as possible, and the focus of treatment is primarily on the present, the here-and-now, and the current circumstance rather than on past traumatic or other formative influences, as in Freud’s psychoanalysis.

Choice, personal responsibility, integrity of the personality, and authentically facing rather than habitually avoiding existential or ontological anxiety and guilt (which results in what Sartre termed *mauvaise foi* or “bad faith” with oneself) are central features of existential psychotherapy. The existential therapist is not limited to the passive and interpretive role of the psychoanalyst, though such a stance may be taken when called for. But the *courage* and *commitment* to truly and genuinely *encounter* each unique patient is required by the therapist, who must not defensively avoid his or her own anxiety by hiding behind a rigid professional *persona* or distancing screen of

therapeutic technique. Carl Jung, who was quite existential in his own approach, acknowledged the inherent mutuality and crucial role of the therapeutic relationship, recognizing that “in effective therapy a change occurs in *both* the therapist and the patient; unless the therapist is open to change the patient will not be either” (cited in May: 22). In existential therapy, the human relationship between patient and therapist takes precedence over technical tricks and, as now confirmed by research, is the primary healing factor in any psychotherapy.

Existential Depth Psychology

Over the years, there has been a gradual theoretical trifurcation in the evolution of existential psychotherapy. Existential and humanistic psychology (sometimes so closely affiliated they become conjoined as “existential-humanistic”) developed simultaneously in America, under the influence of Abraham Maslow, Carl Rogers, and Rollo May, among others. Both humanistic and existential psychology object to the dehumanizing and reductionistic application of the psychiatric medical model in the diagnosis and treatment of so-called mental disorders, proposing a less mechanistic, biological and deterministic, more positive, humanistic paradigm for personal growth and psychotherapy. But Rollo May’s own philosophical worldview and depth psychologically informed psychotherapy differs fundamentally from the rabidly anti-psychoanalytic, overly optimistic, perhaps even naïve “human potential” movement embodied by Rogers and is best described as an *existential depth psychology*.

Otto Rank, a close disciple of Freud and one of the seminal figures in the development of existential depth psychology, “accepted the categories of Freud, Jung, and Adler – mechanisms, patterns, and types – but found them useful only up to a point, after which they impeded therapy and even theory” (Lieberman, cited in Diamond 1987, p. 10). “Depth psychology” (*Tiefenpsychologie*) addresses the phenomenology of the “unconscious,” the “not known” contents of the psyche. Existential and depth psychology seem

antithetical and incompatible to some (especially certain members of the Society for Existential Analysis in London, a third tributary led by Emmy van Deurzen-Smith, Ernesto Spinelli, and the late Hans Cohn, who practice a purist version of “philosophical counseling” or “clinical philosophy”), but are reconciled as complementary in existential depth psychology. The Freudian notion of the unconscious is eschewed and rejected outright by many existentialists as a fragmenting, reified doctrine that diminishes integrity of the personality, free will, and personal responsibility in ways inimical and antithetical to existential therapy. However, while fully cognizant of these legitimate theoretical and practical dilemmas, existential depth psychology recognizes the clinical necessity of acknowledging the phenomena of repression and unconsciousness. Therefore, the phenomenological fact of the *unconscious* is retained, albeit in modified form, by American practitioners of existential depth psychology such as May, Bugental, Yalom, Perls, Schneider, and Diamond.

For Rollo May, the *unconscious* is existentially redefined as “those potentialities for knowing and experiencing which the individual cannot or will not actualize” (1983, p. 18). Moreover, May, unlike Rogers and others in the humanistic movement, held that “constructiveness and destructiveness have the same source in human personality. The source is simply *human potential*” (in Diamond 1996, p. xxi). This conception of human potentiality as a double-edged sword informs May’s controversial theory of the *daimonic*: his own phenomenological interpretation of the unconscious, similar though not identical to Freud’s “id” or Jung’s “shadow,” and eminently useful for comprehending the inherent human potentiality for psychopathology, destructiveness, spirituality, and creativity (see Diamond 1996). The *daimonic*, as May (1969) defines it, “is *any natural function which has the power to take over the whole person*. Sex and eros, anger and rage, and the craving for power are examples. The daimonic can be either creative or destructive and is normally both” (cited in Diamond 1996, p. 65). In existential depth psychology, the daimonic is an existential reality, the dynamic ground

of being or existence, the indivisible source of vital, life-giving psychobiological energy or power. When chronically repressed, the daimonic becomes pathological but, when properly related to, contains valuable positive potentialities. Existential depth psychology embraces and makes therapeutic use of May’s model of the daimonic, encouraging its constructive integration into consciousness, *but never to the point of dogmatism*, and is not “defined by duration of treatment, technique or frequency of sessions *but rather by the degree to which it directly addresses the daimonic and the various other existential elements of life*” (Diamond 1996, p. 219).

As May, who was briefly a Protestant pastor prior to becoming a clinical psychologist explains, “I do not believe in toning down the daimonic. This gives a sense of false comfort. The real comfort can come only in the relationship of the therapist and the client or patient” (in Diamond 1996, p. xxii). Indeed, “it is only by moving through this suffering consciously, willingly, and developing a more philosophical or spiritual stance toward it, that patients approximate anything close to a ‘cure’ in psychotherapy” (Diamond in Hoffman et al. 2005, p. 197).

Nihilism, Anxiety, and Spirituality

Spirituality entails the capacity to see life as it is – wholly, including the existential realities of evil, suffering, anxiety, and the daimonic – and to love life nonetheless. This *amor fati*, as Friedrich Nietzsche phrased it, “is a spiritual achievement of the highest magnitude” (Diamond in Hoffman et al. 2005, p. 197). It is in this regard, and in some of the striking parallels between phenomenology, Taoism, Hinduism, and Zen Buddhism, that existential depth psychology can be correctly called a secular spiritual treatment for the postmodern *condition humaine*. While not inherently a religious approach, and indeed in some ways anti-religious, existential psychotherapy addresses many of the basic questions and problems that concern traditional religions of all kinds: death, meaninglessness, loneliness, loss, suffering, imperfection, finitude, insecurity, anxiety, guilt,

freedom, responsibility, evil, etc. These are the bare existential facts of life, what existential theologian Paul Tillich called “ultimate concerns.” *Nihilism* – the rejection of religion, spirituality, meaning, purpose, and value in life due in part to the presumed negating finality of death – is often associated with existentialism. Yet, nihilism is clearly neither the goal nor intended consequence of existential psychotherapy but, on the contrary, its starting point.

Equally important to the practice of existential therapy in general is the phenomenon of anxiety, in both its normal or ontological and neurotic or pathological aspects. Kierkegaard (1844) called anxiety “the dizziness of freedom” that inevitably accompanies recognizing our human potentiality and responsibility. Following Kierkegaard and Tillich, May defines anxiety as the “*experience of Being affirming itself against Nonbeing*” (1977, p. xxi), positing that when we chronically avoid existential anxiety, it only becomes more neurotic, destructive, and debilitating. In existential psychotherapy, *neurotic anxiety* is a pathological product of *normal anxiety*, and both are utilized in the therapeutic process rather than merely chronically suppressed psychopharmacologically or otherwise. To a significant extent, existential psychotherapy is the psycho-philosophical treatment *par excellence* of postmodern nihilism, anxiety, and existential crisis manifesting as depression, stress, addiction, anger, rage, and other all-too-ubiquitous symptomatology. Viennese psychiatrist Viktor Frankl’s idea of neurosis resulting from an “existential vacuum” which human nature abhors due to a deeply rooted “will to meaning” is particularly relevant here. Fulfilling the will to meaning is one way of counteracting nihilism: “Meaning – given, found or created – enables one to love life and live it. We create meaning because we cannot exist without it” (Lieberman, cited in Diamond 1987, p. 2), thus the strong emphasis on the sense of *meaning* and *purpose* in existential therapy.

Creativity, Courage, and Acceptance

Creativity can be another antidote to the toxicity of nihilism and provides a constructive

channeling of anxiety. Hence, the purposeful focus in existential psychotherapy on creativity and the creative process: the creation of meaning, the creation of art, and the creation of self. The existential spotlight on “will” as central to the creation of self and a constructive, meaningful life was presaged by Rank, who held in his notion of the *artiste manqué*, that “the individual creates his own personality by creative willing, and that neurosis is due precisely to the fact that the patient cannot will constructively” (May, cited in Diamond 1987, p. 2). And, whether or not one concurs with Yalom’s (1980, p. 482) premise that “meaning, like pleasure, must be pursued obliquely,” his clinical focus on *engagement*, encouraging the patient’s commitment to and investment in life, is well taken: “Engagement is the therapeutic answer to meaninglessness regardless of the latter’s source” (Yalom 1980, p. 482).

Finally, existential therapy encourages the patient’s heroic acceptance of life’s inevitable tragedy, anxiety, suffering, and death’s inexorable reality. “Courage,” writes Paul Tillich, “is the power of life to affirm itself in spite of. . . [its daimonic] ambiguity, while the negation of life because of its negativity is an expression of cowardice” (cited in Diamond 1996, p. 309). Sigmund Freud’s own existential (but not traditionally religious) attitude can be seen in his misunderstood, seemingly cynical, pessimistic comment that the goal of psychoanalysis is to transform neurotic misery into common unhappiness: like death, some suffering in life is existential, ontological, and inescapable. “Nowhere in religious. . . [symbolism] is this spiritual principle of accepting life’s suffering and acceding to one’s divine destiny more dramatically, movingly and elegantly illustrated than in the Crucifixion” (Diamond in Hoffman et al. 2005, p. 199). But, with or without religious faith, whether like Kierkegaard or Sartre, one can still freely choose the attitude taken toward such stark existential facts of life, a “willing affirmation of the must” to employ Rank’s felicitous phrase, which is itself a type of spiritual transcendence. “It is,” says Tillich (1952), “the happiness of a soul. . . ‘lifted above every circumstance’” (cited in Diamond 1996, p. 292). Paradoxically, along with the courageous affirmation of existence and its vicissitudes, including

anxiety, alienation, insecurity, suffering, finitude, meaninglessness, and death, comes a deeper appreciation of life; a fuller capacity to care, feel, and love; and a heightened sensitivity to joy, awe, and beauty.

Existential Shattering

Louis Hoffman¹ and Lisa Vallejos²

¹Saybrook University, Oakland, CA, USA

²The Humanitarian Alliance, Denver, CO, USA

The term existential shattering was coined by Tom Greening and initially developed through his teaching and scholarly presentations. The development in the scholarly literature emerged from students and colleagues who began applying and researching the concept (see Hoxie 2013; Vallejos 2015). Existential shattering is the sudden and unexpected dismantling, or shattering, of one's self-conception and worldview as a consequence of an event or process that the individual has experienced. Existential shattering can be further described as a “devastating, unexpected, irreversible event, a trauma, in which one's fundamental systems of meaning and relating are irreparably shattered” (Vallejos 2015, p. 6).

Although there is an evident relation with trauma and posttraumatic stress disorder (PTSD), existential shattering should not be

reduced to PTSD and, instead, may help distinguish between different types of traumatic reaction (Hoffman et al. 2013). An individual who has experienced existential shattering needs to rebuild their identity, self-conception, and worldview as a result of the shattering experience that caused ontological insecurity or the understanding that the foundations upon which one has built their life is inherently unstable, uncertain, and can be obliterated at any time. Individuals who have survived existential shattering and successfully restored their psychological well-being learn to live with the inherent instability of life and to create a life and meaning systems that are flexible, malleable, and open to change.

An existential shattering has implications for one's identity and experience of being-in-the-world. Following the shattering, the individual may experience a general sense that the world is no longer safe, or no longer what one thought it was, which contributes to a feeling of disillusionment and not being at-ease. Similarly, one may begin to question their understanding of themselves, including their values and worldview. This is a shattering of how one experienced and understood their existence. Addressing existential shattering requires an honest facing of what occurred and the consequences of this along with consideration of rebuilding one's worldview and meaning structures. It is not possible to restore the previous worldview or identity in any genuine way as these have been shattered. Rather, one must rebuild these inclusive of the reality of the shattering and different experience of oneself and the world in which they live. This process of accepting the contingency of life is what van Deurzen (2002) described as "coming to terms with life" (p. 166).

Applications

Existential shattering has a number of important applications in contemporary psychological research; however, this is just beginning to be explored in the psychological literature. A few important considerations are essential, such as its relationship to moral injury and trauma, as well as

the occurrence of an existential shattering outside of a readily identifiable traumatic event.

Existential Shattering and Moral Injury

Moral injury is also a relatively new concept that may help differentiate different types of PTSD. Castro and Bruning (2018) noted that, "Although scholars, clinicians, and researchers have struggled to define moral injury, a core element that is universally recognized is a transgression from one's deeply held beliefs and values or betrayal from those entrusted with authority" (p. 119). Not all potentially traumatic experiences that result in PTSD or similar traumatic reactions include a moral injury; however, if a moral injury occurs, it may increase the likelihood that the potentially traumatic event will result in PTSD. Furthermore, when a moral injury is part of a traumatic experience, this may have implication for treatment. For example, Dursun and Watkins (2018) note that the presence of a moral injury increases the likelihood that responses to the trauma will be less predictable. Both moral injury and existential shattering complicate the treatment process and may indicate that many standard treatments for PTSD may not be adequate to address the full consequences of the traumatic experience.

Moral injury is more narrowly defined than existential shattering, including having a more restrictive definition of what may cause a moral injury (i.e., it is connected to some betrayal of one's values or betrayal from an authority figure). Conversely, existential shattering focuses on the individual's response to an event or experience and may be triggered by events that are not necessarily considered traumatic in the traditional sense. However, existential shatterings are more likely to occur following a potentially traumatic event; the presence of a moral injury as part of or concurrent with potentially traumatic event may further increase the likelihood of an existential shattering.

Existential Shattering and Trauma

Not all trauma is the same, nor can it be treated the same in a therapeutic context. When considering PTSD, the co-occurrence of existential shattering with PTSD may introduce a level of complexity to

the traumatic response. Many trauma treatments focus on cognitive and behavioral strategies that target specific symptoms. These interventions are not as effective at addressing issues connected to meaning, identity, and worldview. Following an existential shattering, therapeutic modalities that are inclusive of helping individuals with issues of identity, meaning, and worldview construction may be necessary for a deeper resolution of the challenges related to the shattering (Hoffman et al. 2013). Greening (1997) described existential shattering as an event that causes one to experience “a fundamental assault on our right to live, on our sense that the world (including people) basically supports human life” (p. 125) and, as such, treatment ought to consider how to assist individuals in re-constructing life in a manner that includes examination of the implications of the loss of one’s sense of safety in the world.

Beyond Trauma

An existential shattering may occur without the occurrence of a readily identifiable potentially traumatic event, at least as these are typically conceived. For example, it is possible that one’s theological or scholastic explorations could cause one to confront contradictions in one’s worldview leading to an existential shattering. Thomas Moore (2002) discussed how many religious individuals in theological or religious studies programs often have been disillusioned by their learning and discoveries leading to a dramatic questioning of their religious beliefs and broader worldview. Similarly, the pervasive experience of racism or other forms of discrimination may gradually cause one to rethink their experience of the world and worldview, particularly as they become more aware of the prevalence of prejudicial attitudes. These experiences may be more gradual than what is typically identified as a potentially traumatic experience but can result in an impactful existential shattering nonetheless.

Commentary

Although existential shattering is a relatively new concept, it has important implications for

future research and clinical practice. Existential shattering represents an aspect of an individual’s suffering that often goes unseen and unrecognized because it falls outside of what clinicians are often trained to focus on and identify in psychodiagnostic interviews and assessments. When only the symptoms are treated while the underlying causes are neglected, individuals may struggle to progress in therapy or only give the appearance of progress through symptom reduction while deeper aspects of their suffering remain untouched. Wong (2008) suggested helping people with “meaning management” by identifying the “feelings, desires, perceptions, thoughts . . . inner voices and secret yearnings, and all the ebbs and flows of or consciousness” (p. 70). Meaning management “capitalizes on human capacities for awareness, reflection, imagination, symbolization, self-transcendence, creativity, narrative construction, and all sorts of meaning-based processes” (p. 70). Wong suggested supporting clients via meaning reconstruction, which is needed when the client struggles to assimilate events that challenge their assumptive world or worldview.

There is a need for continued research and clarification of the concept of existential shattering. Ren et al. (2018) conducted one of the few studies that sought to clarify the construct of existential shattering. They identified “a lack of meaning, emptiness, burnout, loneliness, uncertainty, self-doubt, secondary trauma, and uncontrollability in life” as connected with existential shattering in their sample, which was comprised of mental health relief workers working with individuals impacted by the 2008 earthquake in Sichuan Province in China. While many of these fit with Greening’s original conception of existential shattering (i.e., a lack of meaning, emptiness, uncertainty, self-doubt, and uncontrollability in life), others may be more likely to be connected with this particular sample (i.e., burnout and secondary trauma).

Further consideration is also warranted pertaining to treatment considerations. While it is logical to assume that therapeutic modalities that give more attention to the existential dimensions of life, such as existential, humanistic, constructivist, and Jungian psychotherapy,

would be more appropriate for working with clients who have experienced an existential shattering, this needs further investigation and consideration.

Existential Unconscious

Duygu Dincer

School of Education, Department of Counselling Psychology, Ibn Haldun University, Istanbul, Turkey

Definition

The existential unconscious is a term offered by Mercurio for coming to light the wisdom that lies within individuals and differs from Freudian psychological unconscious in some ways (Bonvecchi 1999). First of all, in counterpart to Freudian psychological unconscious that puts stress on early childhood period, the existential unconscious focuses on the period from the intrauterine to adolescence (Mercurio 2009). Secondly, the existential unconscious is a place where not only our greatest painful and traumatic experiences but also pleasing and satisfying things that influence ourselves and our acts are stored (Mercurio 2009, 2011a), whereas the psychological unconscious is a place where individuals' repressed motives, unwanted desires, and memories reside (Muckenhaupt 1997). Thirdly, the existential unconscious composes of four components, the factual unconscious, reactive unconscious, decisional unconscious, and creative unconscious (Mercurio 2009, 2011a) (see Fig. 1), while Freudian unconscious is not separated into parts; it is also a part of mind (Muckenhaupt 1997).

According to the theory of the existential unconscious, the factual unconscious is related to positive and negative events, facts, perceptions, and experiences that have happened in individuals' lives from the moments of birth to the present time; the reactive conscious is relevant to reactions (e.g., the

Existential Unconscious, Fig. 1 The existential unconscious

reactions following the behavioristic law of Stimulus-Response) to these events that have occurred in personal life; the decisional unconscious is related to personal decisions based upon conscious or unconscious love and hate experiences of individuals, and finally, the creative unconscious is relevant to beauty and immortality. From the perspective of Sophia-Analysis, creativity and “absolute beauty” are the main characteristics of God (Mercurio 2011b, p. 44) and seeking for beauty through art is a way of reaching God.

The existential unconscious also differs from Jungian collective unconscious. Jungian collective unconscious is the part of psyche including archetypal and mythological themes shared by all humanity (Jung 1949), whereas the existential unconscious does not include them even though it has an existential personalistic anthropological framework including the evolution of the human being. Similarly, the existential unconscious also differentiates from noetic or existential-meaning unconscious offered by Viktor Frankl, who is the founder of Logotherapy, although they have some similarities. For instance, Frankl indicates that the existential unconscious includes hidden or potential meanings of life (Lantz 1992), but Mercurio points out that the existential unconscious is the key of “a dialectic process of liberation” (Bonvecchi 1999, p. 79). This dialectic process encourages people to make and carry out their own “syntheses of opposites” within life and relationships (Mercurio 2011b, p. 11).

The existential unconscious is related to the concept of freedom that is one of the premises of being Person (Mercurio 2011a). Human beings have to make decisions based on free will to actualize themselves. But this freedom is very different from Sartrean thought assuming that people are “condemned to be free.” According to Sartre, people are condemned to be free because “they were cast into here and they did not create themselves” (Sartre 2007/1947, p. 29). So, being here is not their choices. In contrast, Sophia-Analysis assumes that life is a gift given by God and people can recreate themselves as Persons by transforming their lives into works of art (Mercurio 2011a).

Existentialism

Todd DuBose

The Chicago School of Professional Psychology,
Chicago, IL, USA

Early Foundations

Existentialism began in the early nineteenth century with the writings of Søren Kierkegaard (1813–1855), though forerunners of existential themes can be traced centuries earlier to Sumerian mythology, Judaic wisdom literature, and early Greek philosophy. Existentialism arose and continues to address and challenge dualisms, abstract, and mechanical ways of addressing human concerns, as it focuses on agency, accountability, and the discovery and/or creation of meaning. Although many histories have been written about existentialism, in this entry I will focus on the religiosity inherent in the tradition that extends beyond the typical differentiation between theistic and atheistic existentialism. I argue that even within atheistic existentialism lies the religious question as disclosed in the dance of nihilism and meaning.

Søren Kierkegaard proposed the rallying flag for existentialism with his pronouncement and commentary on truth as what is experienced, not systematically thought out, when living subjectively in the world. Addressing the experience distant abstraction of Hegelian systemics, as well as the institution of the church, Kierkegaard called for more authentic accountability for one's beliefs and comportment in everyday existence. What matters, for Kierkegaard, is the lived experience of individuals in their lived situations, rather than any presumptions about life discerned through abstract objectivity, particularly those of rationalism, empiricism, and/or speculative metaphysics.

These themes were furthered by existentialists too numerous to cover completely. One of the difficulties presented to any researcher in this field is that existentialism is notoriously slippery when one tries to define it as a movement. Walter

Kaufmann, perhaps the most well-known commentator on existentialism, aptly noted that by definition existentialists resist collapsing or subsuming uniqueness into generic systems of creeds and other canons of civility (Kaufmann 1975).

Kierkegaard (1813–1855), Friedrich Nietzsche (1844–1900), Martin Heidegger (1889–1976), and others warned against the fade into an undefined existence, co-opted by the crowd, the “herd,” or the “They.” One escapes to the crowd to avoid facing the call of existence to define oneself, to “stand out” in Heidegger’s language. Standing out in existence includes face-to-face encounters with dread, boredom, alienation, the absurd, nothingness, as well as freedom, and commitment. Through such encounters one comes to understand the significance of one’s life, not an easy task, and either accepts or rejects calls to more meaningful and fulfilling relationships and projects in life. Life is meaningful as we live it out. We do not first find meaning and then decide to live out our lives. Our “essence” is discerned only in our “existence,” as Jean-Paul Sartre (1905–1980) noted (1943/2003).

Existentialists are divided among themselves as to the authenticity and legitimacy of belief in God as well as to what one means by the term “God.” Theistic existentialists highlight the inevitability of our inherent tendency toward Otherness and understanding of ourselves in our situations in life in light of those encounters. Atheistic existentialists argue that displacement of one’s responsibility onto an external entity in hopes for deliverance from the complexities of contingent existence is a manifestation of moral cowardness.

Existential Approaches to Psychology and Religion

Existential approaches to the field of psychology and religion have attempted various ways of resolving what they see as an unnecessary antagonism between atheism and theism. Paul Tillich (1886–1965), known primarily as a theologian, wrote extensively on the existential condition as

well as on the psychotherapeutic care within those conditions (1952, 1957, 1966). Most particularly, Tillich called for our “courage to be” in spite of anxiety or our impending nonbeing and call to freedom. Erich Fromm (1900–1980) and Rollo May (1909–1994) furthered these concerns, albeit in different ways (Fromm 1941; May 1972). Viktor Frankl (1905–1997) established Logotherapy as a result of his own lived experience within a concentration camp in which he saw how the power of the will to live if there were a reason or person for whom to live. Karl Jaspers (1883–1969) wrote of “boundary situations,” “the Encompassing,” and communication almost in a sacramental way. R.D. Laing (1927–1989) brought the insights of existential phenomenology to humanize modes of psychiatry’s more instrumental qualities. Contemporary existential psychotherapist, Emmy van Deurzen (1998), has written of the *Überwelt*, or the spiritual and encompassing world in which we discern our meaning. One could say that each one of these individuals above addressed the notion of “God” in less than orthodox ways; they all nonetheless saw the centrality of spirituality as essential to a meaningful life, albeit a spirituality that found within existence, rather than as an escape from it.

Commentary

One of the misconceptions to clarify about existentialism is the claim that it is too individualistic. No doubt schizoid ways of being-in-the-world have bolted onto the existential tradition, which is understandable given a central theme of inherent loneliness. When existential thinkers refer to such concepts as subjectivity, loneliness, “standing out,” and so forth, one must understand these concepts as calls to distinctiveness and ownership of one’s lived, conditioned existence and comportment in the world rather than as statements about physically measured isolation. Subjectivity does not mean an isolated privation of existence, but a committed risk of being “all in” a particular situatedness, exercising agency amid and released by inherent

limitations. What truly matters is experienced when taking this stance in relation to others. A true and authentic encounter comes from shared “all-in-ness” that is nonetheless respective of the incomparable stances taken by communal participants. A call to living a distinctive, differentiated, and accountable life is not an opposition to living a relational life. The existential position is not opposed to the sociology of others, but warns against a qualitative erasure of unique “callings to be” amid the counter pull to forfeit one’s incommensurability. In fact, we are ontologically relational. Our existence is foremost and forever a “being-with-ness.”

Another issue meriting commentary is the apparent antagonistic relationship between existentialism and religion. The relationship between existentialism and religion is more integrated than one may presume. Certainly the Nietzschean hammer against slave morality, as he saw reinforced by Christian morality, and even the theist Kierkegaard’s attack on Christendom have led to suspicion of the institutionalization of the spirit.

Theistic or not, however, freedom, transcendence, and meaning are cornerstones of this tradition. In spite of theistic existentialists throughout the history of this philosophical position, this approach to human meaning and significance is seen by some readers of this tradition as carrying an inauthentic and irreconcilable oxymoron. One can point to the broad strand of atheism or emphasis on the human person’s responsibility to create his or her own meaning, so often expressed in existential literature, as cases in point. Yet, theistic and atheistic existentialists would agree that transcendence is not an escape from existence and impossible to accomplish anyway. The project of doing so discloses a “bad faith” (Sartre 1943/2003), “inauthenticity” (Heidegger 1962), and foreclosure on accountability for the burden of one’s existence. Nevertheless, the counter challenge has its legitimacy as well: movement into the mystery of Otherness, even if paranormal, may be the most challenging Kierkegaardian leap of faith. Not being open to what is beyond our comprehension and control is another form of retreating into anonymity or herding.

I suggest an existential understanding of psychology and spirituality holds possibilities for the field's deepest foundation and most promising future. As human beings we are *homo religiosus*, or inherently religious, in which life *is* transcendence, meaning, purpose, and significance. Doctrinal and creedal statements of belief and ritual practices found in religious traditions are expressions of, or creations of, such experiences of meaning (Gilkey 1976). The absence of propositional assent to God as an entity need not nullify atheistic intentionality and "about-ness" that motivates movement through situations in one's daily existence – a secular faith. Moreover, an existential-phenomenological understanding of Otherness is nonetheless still an existential *human* experience. This point grounds an understanding of existentialism as religious. This is an experience that is neither otherworldly nor merely created by the "thrown" person in the situation; we find ourselves in situations partly due to our agency and mostly a convergence of an infinite number of decisions and comportments beyond our control (van den Berg). Furthermore, emphasizing Otherness as the context of meaning and relationship as the necessity of self-understanding incarnates Otherness within existence. An existential-phenomenological understanding of religious experience as encounters with Otherness from situated stances testifies to the radical immanence of transcendence (Driver 1985). Transcendence, then, occurs with each possibility of transformation within the graced limitations of our coexistence.

Exodus

Ingeborg del Rosario

Emmaus Center, Quezon City, Philippines

The Exodus is the second book of the Jewish Torah and of the Old Testament of Christian Scriptures. From the Greek word *exodo*, which means “a road out,” the Exodus refers to the journey of the Israelites who were led out of Egypt by Moses after many years of oppression and slavery. While rooted in historical events, the Exodus story is primarily a foundational faith experience, the core memory upon which the spiritual identity of the people of God is formed. Crucial to this testament of faith are the experience of a living, liberating God who hears and answers the cry of the poor, enslaved and oppressed, and the faith commitment of a people who live in remembrance of the divine redemptive activity.

The story of Exodus as a journey of moving away from enslavement and oppression into greater freedom and fullness of life also provides a template and guiding narrative for the individual in the continuing process of a search for identity and authenticity of self, wholeness and integrity, and healing and transformation. The beginning of the journey is marked by the recognition of the magnitude of suffering, the coming to consciousness of the intolerability of the anguish and agony of enslavement, and the deep longing for an end to its ruthlessness and devastation. In the *Book of Exodus*, the story of divine activity begins with the cry of the Israelites, who “groaned under their slavery and cried out” (Exodus 2:23), and of the divine response, God who “remembered . . . looked upon . . . and took notice of the Israelites” (2:25). The experience of enslavement can be external in nature, of an economic, political, social, or cultural dimension. Enslavement can also be internal, intrapsychic, and relational in nature. Depression and anxiety can enslave. Inadequate developmental environments and

neglectful or erratic attachment dynamics in childhood can create psychological impoverishment and hardship in adult life and relationships. Trauma and abuse can grossly impede freedom of self-attunement and quality of engagement with others. Individuals can live many years without a conscious awareness of their being constricted by significant formative experiences in the past. They are unfree, estranged, and alienated from a sense of their true self, reacting from the protective defenses of the false self, relating consistently from a place of pain, an internal space of emotional vulnerability, psychic distress, and spiritual emptiness. The process of beginning the exodus journey of self-transformation involves the emergence of this pain and distress into consciousness, the “groaning and crying out” that expresses an overwhelming longing to be freed from this enslavement, thus signaling the genesis of a commitment to the process of inner change and liberation.

The process of moving towards freedom, authenticity, and transformation will naturally meet internal resistance, especially after years of having lived with restrictive yet familiar dynamics and behavior patterns. The Israelites, after leaving Egypt and wandering through the wilderness, expressed this longing for the familiar ways of enslavement. When faced with fear and anxiety that accompanied the unknown, they complained to Moses: “What have you done to us, bringing us out of Egypt? Is this not the very thing we told you in Egypt, ‘Let us alone and let us serve the Egyptians’? For it would have been better for us to serve the Egyptians than to die in the wilderness” (14:11–12). Relational ways are long standing, habitual, and familiar. Even if they have become maladaptive and self-damaging, they had provided a sense of security and comfort. New ways of perceiving, feeling, and doing involve venturing into a space of uncertainty. While health sustaining and life nurturing, these ways may paradoxically feel frightening and disorienting, seemingly overwhelming and out of control. The desire for newness and freedom can meet repeatedly with the yearning for the old and familiar.

The pull to authenticity and health can oscillate with the wish to return to what is accustomed and habitual.

While the process towards freedom and wholeness involves ongoing inner work and effort towards engaging newness, it also presumes the need for active waiting that allows healing to happen. The words of Moses to the Israelites respond to their fear and anxiety around the demands of the exodus journey: “Do not be afraid, stand firm, and see the deliverance that the LORD will accomplish for you today; for the Egyptians whom you see today you shall never see again. The LORD will fight for you, and you have only to keep still” (14:14). The exodus journey calls for determined movement and committed effort towards greater freedom and authenticity of self. At the same time, the exodus journey necessitates the capacity for steadfast and quiet presence, the strength of reflective stillness that enables insight to be internalized, change to be metabolized, and self-transformation to take root. The process of healing from inner enslavement and oppression to authentic freedom and liberation of self happens with both movement and stillness, the dual dynamic of active and passive strength that both enables change and trusts the healing process to evolve, allowing transformation to happen in oneself.

The Exodus story teaches that the journey out of enslavement into freedom does not happen with immediacy. Traumatic wounding is multi-dimensional and extensive. The movement from psychic oppression and constriction takes the gentle respectfulness of time and patient hopefulness in the promise and imminence of newness and liberation. This process of healing from brokenness towards living from a space of authenticity and coming to a firmer sense of self-identity and fulfillment unfolds over one’s years. The Israelites, freed from slavery in Egypt, travelled for 40 years, wandering in the wilderness and sojourning to the land promised them. Their evolution of spiritual and communitarian identity as a people began with the liberation from slavery. Its shaping, consolidation, and development continued over time.

As the myriad challenges of journeying with hope towards wholeness and freedom are faced,

the role of remembrance is essential. The story of Exodus began with the Israelites crying out to God who remembered the covenant and heard their cry. With their liberation from Egypt, their spiritual identity as God’s people is grounded in their remembrance of this saving act. The commandment and laws of the covenant have their wellspring in this redeeming memory: “I am the LORD your God, who brought you out of the land of Egypt, out of the house of slavery; you shall have no other gods before me” (20:1–2). The act of forgetting, of denying this foundational experience, creates internal fragmentation and spiritual disconnection from the space of self-authenticity and identity. When the Israelites did not remember their redemptive experience and their liberation by God from slavery in Egypt, they fashioned a golden calf (Exodus 32). Remembering the experience of redemption keeps alive hope and enduring trust that one’s cry will not go unheard, that the suffering from one’s past will not eradicate the promise of change and newness in the future. Forgetting brings a loss of trust in and connection to one’s self and the consequent despair when journeying through the demands and challenges of life. Remaining connected to the integrity of the true self and holding on to the belief that healing into life and authentic relationship are possible, in spite of the bondage of internal oppression and psychic enslavement, is the contemporary psychological echo of the redemptive memory that is the heart of the Exodus story, the pulse and energy that fuels the human journey to freedom of life.

Extrasensory Perception (ESP)

C. Harry Hui

Department of Psychology, University of Hong Kong, Hong Kong Special Administrative Region of the People's Republic of China, Hong Kong, People's Republic of China

Extrasensory perception refers to the alleged processes of precognition, telepathy, and clairvoyance that take place via channels other than the sensory system that biologists and psychologists have been researching with scientific means. Precognition is the knowledge of future events obtained not through logical reasoning but through dreams or other psychical awareness. Telepathy is the sending and receiving of message over a distance, through nonphysical means. Clairvoyance is the perception of an object that is out of normal sight. Some records exist of people who have such experience of anomalous information transfer. Goulding and Parker (2001) claim that 25–45% of the western population may report some form of ESP or other paranormal experiences.

Some clinical psychologists regard such experiences as delusion and therefore associate them with mental disorder, while the more new-age-oriented psychologists do not agree with this correlation (Targ et al. 2000). Besides the psychopathological explanation, some cognitively oriented experimental psychologists attribute the experience to the experient's cognitive bias or defective probabilistic reasoning. Biological psychologists, on the other hand, search for brain dysfunctions. Needless to say, the ESP experience can also be veridical.

Besides anecdotal evidence reported in the popular press, empirical evidence of the phenomenon is being gathered in more rigorously controlled conditions (Bem and Honorton 1994). Using the “ganzfeld procedure,” the researchers shielded participants from visual and auditory stimuli. They then asked some to “send” to others one of four images, which was correctly received about one-third of the times. Bem and Honorton (1994) regarded this as better than chance, which

is 25%. However, a more recent meta-analysis that included additional studies suggests that the effects are small or statistically nonsignificant (Milton and Wiseman 1999).

Déjà vu experience is sometimes included in the class of ESP. This strange sense of familiarity with a place or event apparently new to a person (“been there before”) is regarded by some as evidence that people have previous lives before the present one (an idea that originated from eastern religious beliefs in reincarnation). According to some psychologists, this phenomenon can be explained naturalistically. Brown (2004) listed at least 34 psychological explanations that are rested on neither parapsychological nor psychodynamic presuppositions. These explanations include subliminal exposure (in which a person had actually been there before but was never made aware of that) and differential neural transmission (in which there is a slight separation between two messages of the event received through two channels).

Besides investigating ESP in its own right, some researchers are interested in measuring people's belief in ESP. Paper-and-pencil instruments have been developed (see, e.g., Goulding and Parker 2001; Tobacyk and Milford 1983). We do not, however, know much about how belief in ESP might correlate with other psychological constructs. Future research may examine Myers' (2006) suggestion that the belief in ESP despite the lack of evidence could be due to flawed processing of information and a hunger for wonderment.

Extraversion

Adele Tyler
Life Journeys, Nashville, TN, USA

A psychological term formulated by Carl Jung in his book *Psychological Types* to describe the flow of psychic energy toward the outer world of people and things or “object.” The word extraversion comes from the Latin words *extra* and *vertere*, meaning to turn outward. Jung theorized extraversion and its opposite, introversion, as two fundamental, innate, and equally valid attitudes of people toward the outer world. Extraversion and introversion describe theoretical polarities on a continuum, with all persons using some degree of both attitudes in reality. Jung defined extraversion as a movement of

psychic energy, or libido, outward from the subject to the object, with one’s energy and interest being drawn as if by magnetic force from oneself to the outside world. People with a preference for extraversion both use and renew their energy by focusing outward and can feel drained by too much time alone or in reflection. Some general characteristics of an extraverted attitude include talkativeness; speaking quickly and with confidence; being demonstrative, expressive, and gregarious; and a tendency toward boredom and distraction. Extraverted forms of religious expression seek God in communion with other people through practices of group worship, oral teaching and study of the spoken word, discussion of religious concepts, and acts of service. Extraversion, like introversion, offers both gifts and challenges, and self-awareness of one’s preferred attitude can enable a person to function more in accordance with his nature and better achieve his potential.

Facing Death

Duygu Dincer
School of Education, Department of Counselling
Psychology, Ibn Haldun University,
Istanbul, Turkey

Physical Death Versus Psychological Death

In the book titled *The Denial of Death*, Ernest Becker (1975) says that “the idea of death, the fear of it, haunts the human animal like nothing else; it is a mainspring of human activity – activity designed largely to avoid the fatality of death, to overcome it by denying in some way that it is the final destiny for man.” (p. ix). So “we admire most the courage to face death” (p. 11). These explanations are right, but they are not enough to understand the truth of death. Because the physical death is not the only way of dying; another way is the psychological death. It also haunts human beings. But this haunting is not paralyzing; rather it is essential to born as a Person. From this point of view, we will focus on why “facing the psychological death” is a commendable activity, and we will search for the answer from the perspective of Sophia-Analysis.

Psychological Death in Sophia-Analysis

According to Sophia-Analysis, not only the idea of physical death that is in us but also the psychological death influences our actions in every stage of our lives, and we need to face these two types of death effectively. For this reason, Antonio Mercurio, who is the founder of Sophia-Analysis, proposes a new way of facing death and says that this new way is one of the essential steps to become a Person. In this step, we must meet six kinds of death: The first death is related to the acceptance of the choral group will and the abandonment of one’s own will during the Sophianalytical group experience. The person experiencing this kind of death does not consciously or unconsciously impose own wishes, needs, or demands, and he/she does not make other members of the group do anything against the group will. The second death is the deaths of narcissistic I and Ideal I (these structures are the parts of Psychological I). Both the narcissistic I and the Ideal I ask to be God, and they do not need building meaningful bonds with other people. So, they create a person like Narcissus who only loves himself and needs his mirror image (Mercurio 2011a). But after the deaths of narcissistic I and Ideal I, “I is transformed, and the SELF can emerge” (Mercurio 2009a, p. 22). The third death requires to reconsider the tragic Oedipus

myth. In the Oedipus myth, the son chooses to kill the father because of the desired love object whereas during the Sophianalytical group work, one metaphorically prefers own death rather than the other. So, one consents to share desired love object with the other and begins to approach the love object as a Person, not a private property. The fourth death is to renounce the ideal of perfection. When a person abandons the ideal of perfection, he/she is not afraid of showing his/her own weak or negatives traits or qualities to the others anymore. One believes that the beloved people will continue to love him/her although he/she has negative sides. The fifth death is associated with the loss of the ideal love object. Having the ideal of perfection, people search for a perfect love object which has all beauty and goodness, and they believe that one day they will find this ideal being. But in the real world, each person has weak or negative sides, and they are not the complete beings. During the Sophianalytical group work, one is aware that only God is perfect and human being is not God. So, searching for a perfect human being is not a reasonable demand. The sixth death is related to the loss of the real love object. Both in the actual life situations and the Sophianalytical group work, people are confronted with the losses of their real love objects, and they experience pain and suffering. These pains are the inevitable parts of human life. When people accept to suffer due to these deaths, they have a chance to create themselves as Persons (Mercurio 2011a).

As mentioned above, there are six ways of facing death and overcoming it in Sophia-Analysis. These deaths contribute to creating a new way of acting although they bring sufferings. In other words, pains and sufferings are new deaths and new births that people face (Mercurio 2011b). As stated by Mercurio (2011a): “there is no authentic birth without an authentic death” (p. 94). “Death allows one to give oneself to oneself” (Mercurio 2011c, p. 143). That is to say, one can “free oneself” (Mercurio 2011c, s.107), have an opportunity to “contact the SELF” (Mercurio 2009a, p. 103), and open “the doors towards a new life” (Mercurio 2009b, p. 60) through facing the psychological death.

Fairbairn, W.R.D.

Pamela Cooper-White
Union Theological Seminary, New York, NY,
USA

W.R.D. (“Ronald”) Fairbairn was born in Edinburgh in 1889, an only child. His father Thomas was a Scottish Presbyterian, and his mother Cecilia was Anglican but raised him strictly according to the Calvinist beliefs of his father. Surprisingly for a child, he enjoyed the lengthy sermons and mandatory church services, and after a serious and scholarly youth, he enrolled in Divinity studies at the London University and then his ministerial training in Edinburgh. His study was interrupted by the outbreak of WWI. He fought in Palestine and North Africa

throughout the war years, and after observing numerous cases of “war neuroses” (PTSD), he returned to Edinburgh determined to change his focus of study to psychiatry. He read the works of Freud and Jung, and the Swiss analyst-pastor Oskar Pfister. He entered analysis with E.G. Connell, an Australian Anglican whose beliefs in a “full-blooded Christianity” rather than doctrinal preoccupation deeply influenced his view of both faith and psychoanalysis.

He began practicing psychoanalysis in 1924 and worked at the Clinic for Children and Juveniles where he treated “delinquent” youth who suffered from sexual abuse trauma. In 1927, he became a specialist and lecturer on adolescence at Edinburgh University. He joined the British Society as an associate in 1931 and a fully certified analyst in 1939. He was already highly regarded in Scotland in 1931, when he was elected a Fellow of the Royal Society of Edinburgh. He resigned from teaching in 1935 order to devote his time to full-time psychoanalytic practice. Although it is often observed that he was geographically isolated in Edinburgh, and he mostly refrained from engaging in the “Controversial Discussions” between the Freudian and Kleinian factions in the 1940s, he was involved in strenuous mutual critique through his papers and international psychoanalytic conference presentations, and his work was influential on the development of British psychoanalysis and the whole school of “object relations,” a term he introduced. His theory is in many ways unique and did not evolve into a further line of theoretical innovations, but his contributions to the concept of object relations have been influential on subsequent generations of psychoanalysts from several separate schools of thought (from the classical analyst-theorist Otto Kernberg, to object relations specialists David and Jill Scharff, and some contemporary relationalist psychoanalysts.) In the 1930s, Fairbairn became fascinated with the work of Melanie Klein, and although he joined the “Independent” or “Middle Group” of the British Psychoanalytical Society after Anna Freud’s arrival in 1938, “Klein’s notion of an inner object world freed Fairbairn to elaborate an entirely new notion of psychic structure” (Rubens 1996, p. 430).

Fairbairn was married twice, first to Mary Ann Gordon, the mother of three children including the Conservative MP Sir Nicholas Fairbairn (1933–1995), whose reputation was eventually tarnished by sexual misconduct and addiction. After Mary Ann’s death, he married Marion Frances Archer (1907–1995). Fairbairn died on New Year’s Eve, 1964, at his home in Edinburgh, at the age of 75, and is buried with both his wives. Shortly after Fairbairn’s death, his biographer John Derg Sutherland wrote of his character,

It would be quite wrong if any impression were to be given at this point of Fairbairn as taking the human scene with a kind of puritanical sense of duty. Quite the contrary. This concern for, and care of, others, for the dignity of the individual, were deeply spontaneous in him and he combined them with a marked feeling of enjoyment and a good sense of humour. . . . [He] had a great feeling for beautiful things. . . . Art and religion were for him profound expressions of man’s needs and for which he felt a deep respect. . . . Ronald Fairbairn was a full man – a rich personality, a man of great integrity, and, in the best sense, of great dignity. He valued the worth of every human individual and he would fight for, and go into the wilderness for, his convictions. (Sutherland 1965, pp. 245–246)

Fairbairn’s theory of human motivation is summed up by the phrase “object-seeking.” His thought developed and changed subtly over the course of his career; his book *Psychoanalytic Studies of the Personality*, published in 1952, represents a mature summation of his settled theoretical edifice (Fairbairn, 2001/1952). In deliberate distinction from Freud’s drive theory, Fairbairn stated that the primary drive of life, retaining the term libido but completely redefined, was the need for other persons. This need is simultaneously biological and psychological. Contra Freud, there is no separate Helmholtzian packet of energy operating within the psyche and creating pressure for discharge. The sexual aspect of the libido is a process of maturational development from a natural oral expression in early childhood (a mouth seeking a breast, and then a whole mother) to genital expression in adulthood (a person seeking a whole person with love expressed through genital eroticism). For Fairbairn, there was no distinct anal phase between oral and genital – only a phase of

transitioning from mother to other love objects. Further, Fairbairn believed that the drive of aggression, much elaborated from Freud by Klein, was not innate but was instead a by-product of frustration due to a failure of the parent(s) to meet the child's needs. The Oedipus "situation" (as he termed it), so central to Freud's theorizing, and adapted by Klein to the first months of life, Fairbairn believed was an instance of the social nature of development and object-relating. Neurosis would arise from this phase, not because of unresolved pent-up pleasure-seeking aimed toward the mother and thwarted by the father, but rather, a much more relational and complex "theory of the personality conceived in terms of relationships between the ego and objects, both external and internal" (Fairbairn 2001, p. 153). "For Fairbairn, internal objects are not (as for Klein) essential and inevitable accompaniments of all experience, but rather compensatory substitutes for the real thing, actual people in the interpersonal world" (Mitchell and Black 2016, p. 17). Health, for Fairbairn, was not autonomy or "individuation," but with respect to object relating as the universal motivating force of human life, health was characterized by mature dependence: "a relationship involving evenly matched giving and taking between two differentiated individuals who are mutually dependent, and between whom there is no disparity of dependence" (Greenberg and Mitchell 1983, p. 145).

The initial impetus for Fairbairn's theory-building was his thorough exposure to Freud's works through his psychoanalytic training, and from the 1930s on, the theorizing of Melanie Klein (which saturated the British Society in the 1930s). The works of a contemporary member of the British Society, John Bowlby, and the Hungarian émigré, Michael Balint, the first exponents of "attachment theory," were also centrally important to his developing theory of "object seeking" and separation anxiety as central factors in children's development. An equally important influence was his clinical work with patients. As he himself observed, classical psychoanalytic interpretation simply did not seem to meet patients' real needs (Fairbairn 2001/1952, p. 137). He wrote,

[T]he ultimate principle from which the whole of my special views are derived may be formulated in the general proposition that libido is not pleasure-seeking but object-seeking. The clinical material on which this proposition is based may be summarized in the protesting cry of a patient to this effect – "You're always talking about my wanting this and that desire satisfied; but what I really want is a father." (Ibid.)

In particular, his exposure to the terrors of war and "war neuroses" among his comrades, as well as his work with abused youth who were considered "delinquent," caused him to think beyond the theoretical foundations of his training, and to bring the impact of real relationships between parents and children, the outer world and the inner world, back into the psychoanalytic discourse (picking up a thread Freud had long left behind when he abandoned the "seduction theory" of hysteria). The systematic nature of Fairbairn's model of mind also reflects the early influence of his fascination with philosophy in his youth.

Fairbairn's metapsychology revolves around his concept of splitting of the ego. He proposed that a central ego (more analogous to a self than to Freud's embattled ego) is present from birth but soon begins to split. This splitting of the ego occurs when the ego identifies with two main types of external object: the "libidinal" or "exciting" object, which stimulates desire and tantalizes (and in Winnicottian terms also impinges), and the "antilibidinal" or "rejecting" object, which frustrates and denies gratification. As these are cathected by the ego and internalized, the ego itself in a sense is torn apart as it identifies with these two objects, creating in turn a libidinal ego and an antilibidinal ego (or "internal saboteur"). The central ego is thus alienated from parts of itself, which are conflicted between desire and repression – now not repression of internal drives but repression of the self and its desires for growth and satisfaction. In this way, everyone is "schizoid" (a term he redefined from Klein), because splitting of the ego is inevitable due to the inevitability of imperfect parenting. The super-ego is no longer formed from parental prohibitions (Freud), but from a combination of the ego-ideal (the goodness of the parents) and the antilibidinal ego. Contra Freud, he posited that

the Oedipus situation is essentially built up around the internalized figures of the exciting mother and the rejecting mother. However, in his attempt to adjust to two ambivalent relationships at the same time, the child seeks to simplify a complex situation by concentrating on the exciting aspect of one parent and the rejecting aspect of the other...; and in so doing the child really constitutes the Oedipus situation for himself. (Fairbairn 2001/1952, p. 175; see also p. 150.)

Psychopathology, according to Fairbairn, is a result of two dynamics within internal object relations. The first has to do with his conception of the super-ego as a complex of the ideal object/ego-ideal, the antilibidinal ego (internal saboteur), and the antilibidinal (rejecting/frustrating) object. A harsh super-ego, internalized from a harsh parental milieu, can create obsessional and even paranoid neurotic tendencies. The second and more generalized theory of pathology has to do with his conception of splitting and projection, adapted from Klein. As in Klein, the individual projects his or her internal world of objects onto external relationships, mobilizing defensive techniques formed during the transitional period of early ego development between the oral and genital stages: paranoid, obsessional, hysterical, or phobic (e.g., Fairbairn 2001/1952, pp. 146, 162). These four techniques were all “schizoid states,” characterized by a neurotic sense of being trapped in one’s habitual self-defeating patterns. Following fairly closely to Klein’s formulations, Fairbairn assigned the more serious psychopathologies of schizophrenia and depression to disturbances in the earlier oral period, with schizophrenia arising from problems with feeding (= loving) and depression related to biting (= hating). He also made a distinction between two general personality types, the “schizoid” (or introvert) and the depressive (or extrovert) – paralleling Klein’s paranoid-schizoid and depressive positions, but for Fairbairn, both could be maladaptive. The schizoid person neurotically fears a repeat of earlier pain from others; the depressive person neurotically fears inflicting pain on others (Fairbairn 2001/1952, p. 164).

The patterns and dynamics inherent in real relationships with real other people (external objects) were internalized by the child from

infancy onward, to form enduring patterns and dynamics of unconscious expectation. Internal conflict in Fairbairn’s model (in contrast with Freud’s conflict model of repression of impersonal mechanical drive energies) refers now to conflicts between the neediest split-off parts of the self contained in the internal exciting object/libidinal object and the most punitive split-off parts of the self contained in the frustrating/antilibidinal object. Repression now is the mechanism by which the central ego is pulled apart by these opposing objects, and intolerable aspects of early childhood relations are preserved and encapsulated in the unconscious, in unconscious identification with the tantalizingly good and frustratingly bad aspects of the real parents. Because children cling to their attachment to early caregivers, in spite of neglectful and even abusive behavior, and they will develop means of coping that are not necessarily helpful in later social interactions (or even antisocial at the extreme), Fairbairn believed that they grow up to “persist in their maladaptive behaviors, because such a repetition maintains a[n unconscious] connection to early caregivers” (Hoffman 2010, p. 142). The extent and quality of pathology depend upon a complex interweaving of external and internal dynamics, including. . .

the extent of bad objects and degree of badness of objects; the extent of the ego’s identification with the bad objects; and the nature and strength of the defenses protecting the ego from objects. . . [T]he severity of psychopathology was understood to be contingent upon the extent of this splitting. . . how much of the ego is still available for real and potentially fulfilling relationships with others and how much is bound up with ungratifying, unreachable aspects of the parents which have become enshrined internally. (Greenberg and Mitchell 1983, p. 171.)

Greenberg and Mitchell summarize by stating, “Perhaps the most broadly characteristic feature of all psychopathology is its self-defeating quality” (Ibid., 72).

Fairbairn did not write extensively about clinical technique. However, his empathy for war veterans, “delinquent” youth, and persons suffering from “borderline” states suggests that, like Winnicott, he created a safe and containing space for patients by listening attentively and with

emotional attunement. It is likely, given his training in London, that he was aware of his contemporaries' discussions of countertransference, and was able to notice what feelings were being invoked in himself, and the patterns of relating that were developing in the analysis through projective processes and projective identification. The goal of therapy for Fairbairn would be to allow formerly sealed-off parts of the self that were preserved in the form of the exciting and frustrating/rejecting internal objects to come to conscious awareness so that the patient's habitually unhelpful patterns of relating could gradually become less rigidly enacted, and eventually change. "Fairbairn located analytic change not in the dawning of insight" (as with Freudian reliance on accurate interpretation), "but in a changed capacity for relatedness, an ability to connect with the analyst in new ways" (Mitchell and Black 2016, pp. 22–23).

Of particular interest for psychology and/of religion is Fairbairn's case, "Notes on the Religious Fantasies of a Female Patient (1927)," published in (Fairbairn 2001/1952, pp. 183–196). In this case (which eventually failed, and the patient died), Fairbairn shows how the patient's hysterical fantasies and psychotic hallucinations reflected her inner object world, with split off exciting and rejecting aspects of both father and mother. This is an early paper which still reflects a considerable influence from Freud, but also shows Fairbairn's increasing interest in schizoid phenomena and internal object relations as the etiology of pathology. This case likely represented an undiagnosed condition of PTSD resulting from childhood sexual abuse by the patient's alcoholic father, who was eventually banished from the household and never spoken about in the family.

Marie Hoffman's research into the influence of Christianity on Fairbairn and Winnicott provides some interesting insights into the possible degree of congeniality between Fairbairnian psychoanalysis and pastoral theology/spirituality. Hoffman considers that Fairbairn's emphasis on the infant's "innate inclination to seek the parent – born object-seeking not simply for survival in the Darwinian sense, but for relationship" stems from Calvin's emphasis on God's love (not only God's sovereignty), and the nature of human

love as a "mirror of God's own desire for relationship" (Hoffman 2010, p. 139). In addition, she sees in Fairbairn's model of psychopathology an echo of the Fall from a state of perfection (impossible for real human parents to provide). The internalized battle between good and bad objects would then create a state of "alienation" (Calvin again) from other persons, and theologically, from God (the state of "human depravity" and inability to save ourselves.) "For Fairbairn as for Calvin, the endpoint of humanity's fall from grace is the fall from relationship" (Ibid., 144).

Given Fairbairn's rather dour Scottish Presbyterian upbringing and worldview, then, it stands to reason that while he had a rather dim view of human nature in general – in which badness is pervasive – he had a corresponding longing for a humane and non-dogmatic Christianity, which he experienced with Connell. His attraction to Pfister's writings suggests that he would have viewed analysis, even if he never spoke of it directly to his patients or wrote about it in his professional works, as a kind of *Seelsorge* in which the patient could attain some hope as his/her condition of internally imposed alienation from self and others was gradually transformed by the experience of a relationship with a "new object" with the analyst. Like Pfister, Fairbairn also wanted to help people with harsh and over-weening super-egos to find a more mature and less self-punishing form of personal morality, more governed by the central ego and the ego ideal than the unconsciously object-driven super-ego. In existential theological terms, if sin is alienation, then healing is a form of restoration to faith and trust in grace – which can come in and through other human beings in mature object relations.

Faith

Philip Browning Helsel

Pastoral Care and Counseling, Boston College
School of Theology and Ministry, Chestnut Hill,
MA, USA

Faith, *fides* in Latin and *pistis* in Greek, can be understood within a spectrum ranging from the content of a particular set of beliefs to the act of trust, usually in a particular community, doctrine, or Deity. In fundamentalist religions, the understanding of faith leans toward an emphasis on the content of belief, especially one's assent to a

certain set of *beliefs*. In these contexts, faith has a noetic quality and is fixed within boundaries to define what is inside or outside its scope. To assent to the appropriate propositions of religion means to have faith, and to be outside these limits is to be unfaithful (or an “infidel,” a term which derives from the Latin root of *fides*).

On the other side of the spectrum, faith is simply characterized as synonymous with trust, an attitude of believing, and thus refers more to the act of trusting than to the specific content of one's beliefs. Within this pragmatic emphasis, the psychological effects of comfort and release from anxiety and insecurity seem to be highlighted, even to the extreme of a marked absence of noetic content.

Most expressions of faith seem to exist in the middle, including an act of trust, with the corollary of the promise of hope, and some particular content in which one's trust is placed (i.e., Deity, religious community, and sacred text). For both religion and spirituality, faith seems to have some particular, specific content that is reflected in the trust of believers. In Buddhism, the believer takes the “refuges,” stating that “I take refuge in the Buddha, the *dharma* (Buddhist teaching), and the sangha (the community of monastics).” This tri-fold affirmation of faith points to the importance of the divine figure, the doctrine, and the community as the component location of spiritual strength and protection. In this affirmation, the individual/community dichotomy is addressed, in that the individual makes the affirmation of faith, placing trust in that tradition, in the midst of the tradition and in continuity with it.

Commentary

Freud explained belief in a Deity as meeting the needs for a projected father figure, in service to cultural ideals of control and manipulation (Freud 1928/1961, pp. 21–22, 1957). Freud was critical of the potential for faith to be used as denial and suggested that the more mature person would face fate (which he personified as the Greek goddess *Ananke*) without recourse to divine escapism

(Rizzuto 1998, p. 170). Jung more positively identified with faith, but without an emphasis on its social or doctrinal aspects. He understood it primarily in terms of *gnosis* (literally “knowledge”), as directly apprehended spiritual knowledge which the individual encounters and which brings about psychic healing through reconciliation of the opposite poles of one’s experience (Melanson 2002, p. 168). Object relations theorists modified Freud’s theories about projection and understood faith as arising from the liminal space between the mother and child in which the child creates and is grasped by transitional objects.

Perhaps no one used Freud’s theories with a more sympathetic eye to faith than Erik H. Erikson, whose developmental theories, formulated from his work with children and based upon a revised Freudian schedule of child development, led him to conclude that basic trust was the result of a positive resolution of the first childhood developmental struggle, between trust and mistrust. He concluded that an adult who had developed basic trust in this first stage would be more likely to have faith than one who did not. Therefore, the early experience of a child set the stage for a positive experience of religious faith in adult life.

Understood as a transformative experiential encounter of the individual, faith had strong significance in William James’ influential *Varieties of Religious Experience*. He suggested that persons who were divided, or troubled by psychic conflict, were more likely to experience surrender of oneself to an outside “something MORE” (James 1902/2007, p. 441). Faith can be seen, in Jamesian terms, as a resolution of a divided self through self-surrender, and thus a source of contentment and joy.

However, faith often occurs alongside doubt, and it could be suggested that the two belong in a dialectical tension. If these are seen in fruitful tension, faith can often be an expansive, life-giving experience. However, faith can also include a great deal of anxiety, about the potential for continuing in the faith and about being outside the limits of faithfulness. The Protestant Reformation can be seen as a way that this anxiety was

addressed historically, with profound cultural and religious implications.

Faith Development Theory

Curtis W. Hart

Weill Cornell Medical College, New York, NY, USA

Faith Development Theory: An Overview

Faith Development Theory is an interdisciplinary approach to understanding the evolutionary process of the development of religious/spiritual values and behavior in the human life cycle. The articulation of faith development theory began in the 1980s with the work of James Fowler and colleagues, and it has found a significant place in theological discourse and in some cases cultural

studies as well. Its genesis took place when Fowler was involved in his doctoral studies and was immersed in the work of theologian and ethicist H. Richard Niebuhr. Niebuhr's prototype of a faith development paradigm had in turn been stimulated by his contact with a portion of the work of Alfred North Whitehead. Fowler's theory is typically taught to theological students and is shared with practicing clergy and interested laypersons as a means of providing a process-based understanding of the way that faith changes and transforms in the lives of individuals. Feminists and others have criticized Fowler's theory for its perceived patriarchal bias and its dependence of on an exclusive Christian framework and anthropology. Application of faith development theory arose originally in the analysis of important historical figures and the life narratives of individuals who undertook to describe how their own religious/spiritual perspectives, values, ideals, and ethics had evolved over the course of time. Faith development theory has also been the subject of cross-cultural study investigation and comparison as well. It has been of considerable value to religious educators and pastoral supervisors for seminarians, both of whom are engaged in offering guidance and promoting insight in matters pertaining to spiritual formation.

Framework of the Theory

The framework of faith development theory is organized along developmental lines and phases. It actively employs Erik Erikson's epigenetic principle, Lawrence Kohlberg's theory of moral development, and Piaget's theoretical observations regarding cognitive function and development. Briefly stated, the process of faith development must be understood both theoretically and functionally as different from "belief" as that term denotes assent to propositions, traditions, rituals, ways of thinking, and hermeneutical approaches to sacred texts of a more or less consistent and often sectarian character. Faith, according to Fowler and colleagues, is a process that may or may not draw on a number of resources within and outside a tradition. It may

have a traditional theistic focus or it may not. Faith development theory may be understood as a highly naturalized concept of revelation that attempts to describe how a person moves through a series of psychospiritual conflicts and challenges needing to be engaged, if not resolved, and sometimes revisited. It is best understood as fluid and organic as it evolves over time in the direction of a nonstatic, though coherent, whole. While not teleological in a formal sense, faith development theory retains a retrospective epistemological methodology that may sometimes uncover patterns and intentions that are at once illuminating and may also be viewed as ontologically significant.

It is important to note that Fowler's theoretical framework has been modified over the years and yet has maintained its essential character. The theory begins with what Fowler calls "undifferentiated faith" that occurs in infancy. It is felt to be a pre-stage in that it is pre-conceptual and largely pre-linguistic. Fowler here relies on Ana Maria Rizzuto's description of the way self knowing first experienced in infancy shapes the information of consciousness and awareness of the other. Its conceptual value lies in its locating the basis of mutuality, strength, autonomy, and hope or their opposites that underline or undermine what takes place later on in the life cycle. It mirrors Erikson's understanding of *basic trust* and Winnicott's notion of *transitional space*. Stage 1 in the faith development paradigm is called Intuitive-Projective faith (ages 3–7) and is a fantasy-filled period whose emergent strength has to do with imagination. Stage 2, Mythic Literal faith, is identified with childhood until adolescence and is the occasion for the enhancement of the child's imagination through storytelling. It often demonstrates a tendency toward literalism and a moral sense that sharply divides "good" from "bad." Stage 3 is called Synthetic-Conventional faith and is identified with growth into adolescence. In fact, some individuals may not progress much beyond this point. Here persons form an individual "myth" in self-understanding in relation to both self and world. It is understood as a "conformist" phase where a person becomes more or less comfortable and

avoids looking critically at their motivations, attitudes, values, and religious/spiritual commitments. Stage 4, Individuative-Reflective faith, describes the transition from late adolescence to young adulthood. Here relationships to others and commitment to vocation become central, and there may be a necessary reevaluation of values and attitudes rooted in the thinking and behavior of adolescence. Perspectives of other traditions on matters of spiritual and ethical significance may likewise become important. Conjunctive faith (stage 5) represents the potentially transitional experience of mid to late adulthood where one reviews, reworks, and rediscovers one's past. There may emerge, according to Fowler, what the philosopher Paul Ricoeur calls a "second naivete" which requires a fresh look at symbols and stories formed during earlier periods of life. It is highlighted by an opening to the voices of a deeper self. This review and reworking of symbolic meanings and commitments resembles some of what William James meant by one's becoming "twice born." It results in a willingness to expend oneself in actions and relationships that embody the ethical norm of "respect for persons" and in an overarching responsibility in the caring for others. The last phase is what Fowler calls "universalizing faith" (stage 6) and it is extremely rare. Persons who reach this stage become "universalizers" of ideas and movements that come to have lives of their own. "Universalizers" become persons endowed with a "special grace" that makes them even more revered once they have died or passed from the world scene. And they often die or are eliminated by those they most wish to save or help. Their number might include such persons as Malcolm X, Dietrich Bonhoeffer, and Martin Luther King.

Conclusion

Even though faith development theory is transparently psychological, it remains possible to connect Fowler's stages to religious/spiritual terms, ideas, symbols, texts, and historical figures outside the boundaries of its Protestant and Christian origins. The challenge to faith development theory is to

help persons from a wide variety of backgrounds and traditions make these connections. The theory is both pragmatic as a tool or "map" though the life cycle even as much as it is a methodological and theoretical challenge to more traditional and academic theological anthropologies.

Faith Healing

Benson A. Mulemi

Department of Social Sciences, Anthropology Unit, The Catholic University of Eastern Africa, Nairobi, Kenya

Faith healing refers to processes of restoration of well-being through religious rituals and submission to divine intervention. It involves the conviction that mystical power can remedy mental and physical affliction either through material medicines or without them. Private or communal rituals and devotion intended to influence supernatural beings to miraculously counteract affliction are key features of faith healing. However, the afflicted may or may not actively solicit the mystical healing as their faith makes them take for granted the solicitude of God or other divine beings. Believers may expect divine beings to reciprocate people's trust, faith, and obedience

with compassion and well-being. Similarly, human agents such as doctors or faith healers may not necessarily mediate the healing process (Dickinson 1995, p. 97). Faith healing is therefore a type of religious, magical, or symbolic healing resulting from direct or indirect ritual manipulation of supernatural forces (cf. Dow 1986, p. 57). Faith in an authority within a religious system defines quests for wellness and confidence in divine intervention (Sykes 1976). Faith has mental (cognitive) or intellectual and emotional or affective components that compel afflicted people to engage in religious actions to protect or restore their health (Levin 2009). The relationship between faith and expected positive health outcomes may be unintelligible, uncertain, and not be easily knowable (Clarke 2003). However, faith underpins the conviction that something ordinarily incomprehensible, such as miraculous healing, can materialize.

Healing

Healing denotes a process of restoring and sustaining wellness (Mulemi 2010). The process reestablishes physical, psychological, social, and spiritual health and growth. It repairs and regenerates body organs and neutralizes forces that may undermine soundness or normal function (Dickinson 1995). Beliefs and religious practices related to healing shape the complex interactions between lived experiences of suffering and faith in mystical restoration of health. Therefore, healing provides a means for expression of suffering and hope, which may elude articulation in ordinary language. The expression brings to the fore concrete, physical, psychological, and social effects of therapeutic practices. Therefore, healing processes may help in determining what counts as illness requiring treatment and when health restoration has been effected (cf. Csordas 2002, p. 11).

Healing practices and beliefs manifest the reality of health as both a subjective and objective reality, which goes beyond wellness of the body to include vitality of the psyche. These aspects involve psychological dimensions in conceptualization of *salutogenesis* (Antonovsky 1979; Levin

and Mead 2008). Salutogenesis constitutes a paradigm for comprehending and harnessing underlying causes of comprehensive health and well-being, with regard to the body, soul, and spirit. Salutogenesis may account for why some people fall ill under stressful conditions while others do not (Billings and Hashem 2010). In this sense, healing provides coping resources that people may effectively use to prevent or deal with a variety of subjective psychosocial and objective physical stressors.

Belief in the agency in faith healing practices of divine forces and entities is ubiquitous because many forms of healing across cultures are religious (Csordas and Lewton 1998). This implies that healing is a prominent universal aspect of religious experience, and it is the most significant symbol in any religion (Sullivan 1987, p. 226). However, both religious and secular belief systems in most cultures primarily attribute a natural capacity for healing to biological processes in organisms. Cure of the body and the quest for wholeness through healing is an important expression of beliefs and attitudes about the invisible powers of the universe (Sullivan 1987). Adherents of religious traditions often extend beliefs about therapeutic power to ordinary agents and institutions associated with representation and transmission of supernatural healing power.

Where people anticipate or perceive delays in objective natural healing processes, they actively or passively pursue divine intervention. The quest for expedited healing and cure shapes people's patterns of resort to different forms of healing, including faith healing. However, medical reference to healing restricts its meaning. The biomedical use of the term refers to empirical signs of wound recovery and granulation of lesions. In this sense, healing denotes the biomedical perspective of treatment; attempts to stop the pathogenic process and the quest to prevent further tissue and organ damage (cf. Levin 2009). However, healing per se entails comprehensive restoration of health by reversing or neutralizing the pathogenic process, restoration of prepathogenic states of health, or attainment a complete state of physical, psychological, and spiritual wellness. This constitutes

the milieu in which faith healing as a process of reestablishing holistic equilibrium is embedded.

Faith Healing and Equilibrium

Belief in miraculous power intrinsic in both medical and nonmedical resources characterizes faith healing. For Christian faithful, for example, a doctor may draw on God-given and divinely effective resources of wisdom and skill. Healers and patients use the resources to restore or preserve bodily or mental health and vigor necessary for active and purposeful life (Dickinson 1995). Faith healing thus provides an opportunity for people to assign meaning to their experience of suffering and recovery. In relation to this the inexplicable hidden power of healing and curing mechanisms are often the subject of faith and religious awe. Believers attribute the power of both medical and nonmedical processes to definitive divine sources. Curing results from technical work drawing on the esoteric knowledge of how to harness and utilize medicines. The medical expert – a physician, surgeon, or traditional herbalist – may enjoy divine favor of privileged access to cure and healing power, and this may present their work as an aspect of faith healing.

Faith healing is a long process involving interaction between human beings and among individuals with the community, environment, and divine beings. This implies efforts to reinstate stability in strained relationships between humans and fellow humans, environment, ecology, and the supernatural. The equilibrium people seek in healing activities includes physical, emotional, social, and spiritual dimensions (Appiah-Kubi 1981, p. 81). Belief and trust in as well as commitment to safeguarding health through the agency of supernatural beings, environmental elements, and fellow human beings typify faith healing. The putative power that underlies healing derives from belief in invisible therapeutic energy in the universe, which flows through and is mediated by mind-body interactions. Hope about the efficacy of faith healing derives from the convergence of belief, trust, and submission to God or the authority of a mystical entity.

Faith Healing Behavior and Activities

Rituals of communal or private prayer, offering, sacrifices, laying on of hands, and ecstatic chanting characterize faith healing. These activities produce possibilities of healing through suggestion, which may counteract health inhibitions in the body or mind. The healing activities may also induce varying degrees of altered states of consciousness. The hypnotic effect, for example, contributes to self-sooth psychological adaptation, which mitigate pain and malaise. Healing activities affirm the conviction that participants can increase contact, communion, and personal relationship with supernatural beings that protect health and counter illness. Healing rituals reflect the belief that patients and their caregivers can effectively harness mystical power to restore health. The faith healing practices may also enhance believers' resiliency in the face of daily life stressors that burden and drain the mind.

Faith healing sessions and practices grant an afflicted person the opportunity to resolve issues that affect mental stability, body function, and immunity to illness. Communal faith healing sessions may facilitate disclosure of personal needs, pent-up emotions, and experiences to God or other divine beings and fellow believers. Healing communities, such as Pentecostal Churches, emphasize the practice of claiming healing. Believers not only experience healing privately but also have the obligation to testify about it publicly (Peacock 1984, p. 41). The declaration of healing reinforces it; hence faith healing activities may be expressions of psychological dispositions.

Transactional symbols such as sacred ideas, divine beings, and objects mediate faith healing. This relates to the belief that mystical entities can bestow different agents including human beings – with power to promote health miraculously. Faith particularizes the symbols from generalized figurative media in cultural mythic worlds that link the social and the self-systems (Dow 1986, p. 63). Religious symbols shape hope and positive illusions that enhance health. The illusions affect physical and mental health through faith and their ability to control undesirable events through

submission to supernatural authorities (Taylor 1983). In this sense faith healing practices contribute to composure that facilitates behaviors that improve both physical and emotional well-being in spite of stressful events.

Faith healing practices produce expected results through behavioral events (Kleinman 1980). Perceived efficacy of healing events materializes by uniting individual (psychobiological) and collective (sociocultural) aspects of the healing process (Peacock 1984). Consequently, faith heals through at least five mechanisms. First, it induces behavioral or conative processes that stimulate health promoting behaviors, such as therapeutic acquiescence. Second, an interpersonal mechanism ensues to connect the sufferer to people who encourage him or her and offers material and emotional support. By involving other participants apart from the patient, faith healing transforms private experience of affliction into collective experience (Peacock 1984). This results in action that partakers of the healing events believe can expedite healing. In the third place, a cognitive mechanism establishes a mental framework that strengthens the natural ability of the human mind and body to heal through self-renewal. Fourth, the affective mechanism links faith to healing by stimulating self-soothing emotions, which may prevent or ease pain and negative effects of stress. Finally, faith contributes to healing through a psychophysiological mechanism, which underpins hope. The psychosocial mechanism is an important aspect that defines resilience and endurance that make health-seeking behaviors meaningful and beneficial.

Conclusion

Faith healing connotes processes, actions, and experience of health restoration drawing on religious rituals and belief in divine intervention. The congruence in faith, trust, and hope in the power of the supernatural and its agents motivate adherence to faith healing practices, behavior, and beliefs. This facilitates subjective experiences of health restoration, which essentially materialize by psychophysiological means. However, the

Supreme Being and other divine agents demand believers' submission in exchange with the promise of mystical or miraculous healing. Faith healing is in effect consistent with the notion of "healing of the whole person" (Berg 1980). It addresses the complex interdependence among mental, social, spiritual, and physical aspects of well-being.

Fall, The

Jill L. McNish

United Theological Seminary, Swedesboro, NJ,
USA

Orthodox View

The term given to the mythical event described in Genesis 3:1–24 in which God cast Adam and Eve out of the paradisaal Garden of Eden because they had disobeyed God in eating the fruit of the tree of the knowledge of good and evil. In casting Adam and Eve out, God said that in so eating the forbidden fruit, humankind had become “like one of us, knowing good and evil.” Although God had told the primal couple that if they ate the forbidden fruit they would die, instead God banished them from the Garden of Eden declaring that thenceforth Adam would have to work hard to produce food from the earth and Eve would be subservient to her husband and undergo great pain in producing offspring. The orthodox Augustinian interpretation of this event is that Adam and Eve’s condition in the Garden of Eden was one of paradisaal perfection but that their rebellion against God led to a separation from God and hence a “fall” into sin, pain, and death. This theology understands the present reality of sin, evil, suffering, and death as flowing from this first dramatic rebellion – the

exercise of the first humans’ God-given “free will” in disobedience of God. In a related line of thought, Augustine also developed the theology of Original Sin, contending that sin was transmitted from generation to generation through the act of procreation, beginning with Adam and Eve. It is often contended that Paul’s writings (Romans 5:12–21; 1 Corinthians 15:21–22) lend scriptural support to Augustine’s understanding of the fall of humankind.

Feminist Reframing

Because Eve was first tempted by a serpent to eat from the tree of the knowledge of good and evil, with Adam eating the fruit only after Eve had already done so and offered it to him, ancient Christian fathers blamed Eve – the first woman – for original sin and hence all evil, sin, suffering, and death since the Fall. This reading of Genesis 3:1–24 has been zealously contested by contemporary feminist theologians who contend that this is a misogynist reading of the story of the primal couple. Rosemary Ruether lambasts Augustinian theology of the Fall and Original Sin as “patriarchal anthropology” (Ruether 1993, pp. 94–99). Reframing the story of Adam and Eve has sometimes led to an understanding of Eve’s action in eating the fruit as being a sign of creativity, curiosity, and initiative and the beginning of culture (see generally Susan Niditch 1992, p. 14 or Mary Daly 1973, pp. 44–68).

Other Views

Although the orthodox theology of the Fall and original sin have descended from Augustine through Aquinas to Catholicism and into Protestant orthodoxy, there have been many other detractors and alternate lines of thought. For example, Irenaeus, the second century Bishop of Lyons (c. 130–202) saw Adam and Eve not as perfect beings who “fell” into sin, but rather as imperfect, immature creatures who were at the very beginning stages of a long process of moral development which would eventually be

brought to perfection by God. This approach was later developed by the German theologian Friedrich Schleiermacher who believed in a progressive development of God-consciousness in humankind from a mere potentiality to a reality in the future. A prominent contemporary proponent of this line of thinking is John Hick (1977), who contends that humankind, “created as a personal being in the image of God, is only the raw material for a further and more difficult stage of God’s creative work. . . . God’s purpose for [humankind] is to lead [it] from human *Bios*, or the biological life of [humankind], to that quality of *Zoe*, or the personal life of eternal worth, which we see in Christ. . . .” (pp. 256–257).

Paul Tillich saw the mythical eating of the fruit by the primal couple as the end of “dreaming innocence.” Prior to the Fall, he contended, “freedom and destiny are in harmony, but neither of them is actualized” (Tillich 1957, p. 35).

Psychological Perspectives

Harold Ellens points to the array of Freudian symbols in the story of the Fall: “the serpent, virgin, flaming sword, nakedness, anxiety, shame, the phallic deity, and the initially non-phallic humans.” However, Ellens’ primary interest is in the use of developmental models of Piaget, Kohlberg, Erikson, and Fowler to understand the story of the Fall as paradigmatic of “human growth from the childlikeness of Eden to mature kingdom building and cultural responsibility. In that growth process, the story plays the role that has equivalents in the human growth process of birth and adolescent disengagement from parents, both inherently healthy processes, and the subsequent independent adulthood” (Ellens 2004, p. 32).

Another line of thinking regarding the mythical significance of the Fall is that the mythic episode of Genesis 3:14–24 represents the developing human animal’s first experience of the *shame* affect which, through the process of evolution, became part of humankind’s hardware script (McNish 2004).

Family and Religion

David C. Dollahite and Loren D. Marks
School of Family Life, Brigham Young
University, Provo, UT, USA

Scholarship documents close connections between psychology and religion, as well as between psychology and family, manifest in part by the existence of two journals sponsored by the American Psychological Association, namely *Psychology of Religion and Spirituality* and the *Journal of Family Psychology*. Yet there is no APA journal at the nexus of family and religion. However, hundreds of scholarly

articles (see Mahoney 2010) and a few scholarly books (see Marks and Dollahite 2017) indicate that religion and family are also closely connected. Space will not permit mention of all the ways that family and religion are deeply entwined, based on psychological research. Here we mention only a few of the most important recent findings.

Religion can be powerful and religious involvement has been shown to have both positive and negative effects on marriage and family life. There are various dualities at the nexus of religion and family life that create the potential for religious involvement to be beneficial, harmful, or both across families and in any given family (Dollahite et al. 2018).

Religion and marriage. A large and growing body of scholarship indicates that religion has a number of important associations with marriage. Across many studies, a positive relationship between shared religiosity and marital quality, marital stability, and marital satisfaction has been documented (Mahoney 2010); however, there are both exceptions and complexities. For example, when more religious husbands enjoy good mental health, the couple enjoys higher marital satisfaction, but when a religious husband has lower psychological functioning, the marital quality of his wife suffers (Sullivan 2001). Further, those in interfaith marriages typically report higher levels of conflict and lower levels of marital stability (Curtis and Ellison 2001) – in some faiths, the interfaith divorce rate at the 5-year mark is double or even triple the within-faith divorce rate (Lehrer 2008).

In summary, married couples who take their faith seriously are more likely to report being emotionally close, more likely to say they have resources to draw on to resolve marital conflicts, less likely to abuse each other, less likely to be unfaithful to each other, and are more likely to remain married (Marks and Dollahite 2017). Even so, these benefits appear to be constrained to same-faith marriages. Recent work indicates that not only shared denomination but similar levels of spousal commitment to a faith tend to yield positive marital outcomes (Marks and Dollahite 2017).

Religion and parent-child relationships.

Longitudinal studies have found that religion can benefit family relationships across generations and that the religious lives of parents have a significant influence on the lives of their children (Bengtson et al. 2013; Spilman et al. 2013). Many parents and children have meaningful conversations about religious matters (Boyatzis and Janicki 2003). Both mothers and fathers influence the religious identities of their children, sometimes in different ways and to different extents. Parental influence is based on parental identity and behavior but is especially influenced by the warmth and closeness of the parent-child relationship. Indeed, various studies have shown that in families with greater warmth in parent-child relationships, it is significantly more likely that children will remain in the faith of their parents (Bengtson et al. 2013; Kim-Spoon et al. 2012; Petts 2014).

Divorce and the religion-family nexus. Even in the event of divorce, parents continue to have an influence on their children's lives, either toward or away from faith (Uecker and Ellison 2012). Indeed, parental divorce typically has a reported affect on the religious identity of children of divorce, as they are more likely to either leave their faith community or switch to another religious group (Uecker and Ellison 2012). On average, adults whose parents divorced are less likely to attend religious services, although some children of divorce become more religiously involved than their parents were (Marquardt 2005). Divorce does tend to disrupt the involvement that children of divorced parents enjoyed in their faith community life, with divorced fathers playing an especially large role in whether or not their children remain involved in a faith (Marquardt 2005). Thus, in addition to the disruption of their parents' marriage, many children of divorce also experience the disruption of their involvement with their faith community. Since this second disruption is often harmful to children of divorce and so rarely discussed in the scholarly literature and in the public discourse, this separation from a supportive faith community has been called both a "spiritual trauma" and a "second silent schism" (Mahoney et al. 2010). On the

other hand, some children of divorce turn to God and to religious communities to help them heal from the pain and loss of their parents' divorce.

Religion and parenting style. Despite religious parents often being negatively portrayed in popular media, empirical research has shown that religious parents are more likely to spend time with their children, more likely to manifest warmth toward their children, more likely to monitor their children, less likely to abuse addictive substances, and less likely to abuse their children. In other words, more religious parents are more likely to manifest a more positive style of parenting, often called authoritative parenting, although Evangelical Christian parents are more likely to consider corporal punishment to be an appropriate disciplinary technique. The research indicates that more religious fathers tend to manifest a range of positive parenting approaches, leading one prominent scholar of religion and parenting to argue that religious men are more likely than non-religious men to manifest the characteristics of the idealized, gentle, and highly involved "new father" that many have called and hoped for (Wilcox 2004).

Religion and family processes. One important intersection of religion and family is regular family prayer, a practice that reportedly influences family relationships in various ways (Chelladurai et al. 2018). Religious belief and practice can also help families to reconcile following normative conflict and distance (Dollahite et al. 2019a). Religious belief and involvement can help couples engage in "transformative processes" that can serve to allow couples to self-correct without clinical intervention (Fincham et al. 2007b; Goodman et al. 2013). Preceding adulthood, religious beliefs, practices, and communities can significantly influence adolescent development (Hardy et al. 2019). Many parents draw on religious teachings and faith communities in their efforts to help their children develop moral principles and practices (Hardy et al. 2019). A growing body of research indicates that religious beliefs and practices help to facilitate relational forgiveness in the face of relational harm in marriages and families (Fincham et al. 2007a).

Religion and coping in families. When families experience stressors and strains, many turn to prayer, seek help from their religious community, find solace and predictability in religious ritual, or seek counsel from religious leaders (Marks and Dollahite 2017; Pargament 1997; Schafer 2013). Research has found that religious coping can have either positive or negative outcomes depending on the type of coping employed. Pargament (1997) identified three major approaches to religious coping which can be applied to families. A *self-directed approach* would involve a family that believes in God deciding to try to cope without any divine assistance; a *deferring approach* would involve a family passing the burden to God and doing little themselves; while a *collaborative approach* would involve a family combining active belief in God with family efforts to find ways to cope with the stressful situation. Recent studies (e.g., Chelladurai et al. 2018; Schafer 2013) have found that, in efforts to cope with the vicissitudes of life, individuals and families engage in a variety of types of prayer, including petitionary prayer (asking for specific outcomes for oneself and loved ones) and intercessory prayer (praying on behalf of someone else without asking for anything for self). A large body of research has found that during stressful times and situations, many people also find significant social support from their religious communities.

Calls for greater diversity. There are important similarities and some important differences in the ways different religions influence families among various religious, racial, ethnic, and cultural groups – and recent empirical work is increasingly exploring these realities by pushing beyond the white, middle to upper-middle class, Christian samples that have historically dominated the psychology of religion literature (Dollahite and Marks 2020). Since at least the turn of the century, leading scholars have called for more research on religion and family that focuses on minority faiths and ethnic minority families. Given the tremendous diversity across and within world faiths, it is important to better understand how families of various faiths go about living out their faith in their marriage, parenting, and family life (Dollahite and Marks

2020). And given that the vast majority of research that has been done on religion, marriage, and family life has been done with samples of majority faiths (e.g., Christianity in the USA), it is important for research to also study religious minority individuals and families in context (Marks et al. 2019). In addition to more study of ethnic and religious diversity, we need greater understanding of how spiritual beliefs, religious practices, and faith communities intersect with families reflecting various structures and compositions (e.g., single-parent families, remarried families, gay and lesbian families).

Clinical implications. Well-informed psychologists will bear in mind that serious religious involvement can promote both psychological and social benefits for individuals, couples, and families as well as psychological and social harms depending on how religious beliefs are applied and lived out relationally (Burr et al. 2012). Thus, scholars have encouraged clinicians who work with religious families to remember that both potentialities are possible both across families and within the same family.

Family Therapy and Pastoral Counseling

Loren Townsend
Louisville Presbyterian Theological Seminary,
Louisville, KY, USA

Every religious tradition attends to family life through sacred texts, codes of behavior, community memory, and practices of spiritual care. These organize gender roles, sexual practices, intergenerational relationships, and how power and resources are allocated. How a religious tradition understands “family” is dependent upon its history and its perceived social problems, social and economic structure, and local mores. Historically, religious and spiritual care of families has taken the shape of moral instruction to reinforce a tradition’s ethical vision for family life. This pattern changed in the early twentieth century, particularly for Jewish and Christian traditions in Europe and North America [The pastoral counseling movement emerged primarily as a North American Christian and Jewish phenomenon in the twentieth century (Townsend 2009)]. New knowledge from social sciences provided religious leaders with expanded knowledge about families that informed religious care of families. In the mid-twentieth century, family therapy was an important part of this new knowledge. Pastoral counseling developed as a professional specialty during the same time and benefitted from family therapy’s concepts, theories, and treatment methods. Contemporary pastoral counseling

embraces family therapy as a significant model of treatment. It is common today for pastoral counselors also to be licensed as marriage and family therapists.

Contemporary professional pastoral counseling developed as clergy counselors pursued training in psychiatric contexts influenced primarily by psychoanalysis (see “► [Supervision in Pastoral Counseling](#)”). For much of the twentieth century pastoral counseling was defined as theologically informed individual psychotherapy (Townsend 2009). In contrast, family therapy evolved as a dissident movement within the medical psychiatric establishment. Prevailing psychoanalytic and early humanistic models of treatment assumed that psychological problems often were related to neurotic conflicts and subjective beliefs patients had about their families. However, psychotherapeutic orthodoxy required that therapists follow Freud’s dictum: treatment is always an individual process. Therapists must have no contact with a patient’s family. Between 1930 and 1960, this insular paradigm was challenged by “pioneers, iconoclasts, and great originals who somehow broke the mold of seeing life and its problems as a function of individuals and their psychology” (Nichols and Schwartz 2001, p. 13). Examples include Paul Popenoe (family planning specialist, Los Angeles), Emily Hartshorne Mudd (social worker, Philadelphia), and physicians Abraham and Hanna Stone (New York), all of whom opened counseling centers for married couples in the early 1930s. By 1940, child psychiatrist Nathan Ackerman was attending to family emotions in treatment and later experimented with therapist-family contact (Ackerman 1958). In the early 1950s, psychologist John Elderkin Bell developed a model of therapy that regularly included family members in treatment. Research in schizophrenia (1950s) prompted anthropologist Gregory Bateson to question the epistemological foundations of psychoanalysis. In its place, he proposed an ecological, interdisciplinary approach to psychological problems and their treatment based on communication theory and cybernetics. Research in schizophrenia also led psychiatrist Murray Bowen to develop natural systems theory as a replacement for psychoanalysis.

By 1970, family therapy represented a substantial paradigm shift away from traditional psychoanalysis and individual therapy. Family therapists rejected traditional views that (1) psychological problems are internal and personal, (2) relational problems are a result of individual pathology acted out in relationships, and (3) individual psychotherapy is the treatment of choice for most problems in living. Instead, family therapists claimed that problems must be evaluated and treated in the context of family and other human relational systems. All treatment – whether a single individual or an entire family was present in the therapy room – used and influenced relational systems. Family therapy rested on a multidisciplinary foundation that produced new models of therapy, strong leaders, and several influential training centers. Gregory Bateson, Jay Haley, and others founded the Mental Research Institute in Palo Alto where they applied communication theory and cybernetics to brief psychotherapy. Murray Bowen taught natural, intergenerational family systems at Georgetown University’s medical school. Child psychiatrist Salvador Minuchin developed structural therapy at the Philadelphia Child and Family Therapy Training Center and highlighted the importance of family organization in human problems. Carl Whitaker (Emory University and University of Wisconsin-Madison) taught symbolic-experiential family therapy. Ivan Boszormenyi-Nagy (Philadelphia) developed Contextual Therapy based on intergenerational relational ethics. Through the 1980s and 1990s, family therapy became a vigorous discipline maintained by accredited academic programs and regulated by state licenses. Family therapy theory has evolved to accommodate new research, changing social conditions, multicultural understanding of the family, postmodern epistemology, and integrative theoretical models. Today, family therapy is a licensable discipline, an interdisciplinary approach to human problems in a relational context, and a constellation of diverse treatment methods.

Pastoral counselors have a history of concern for marital and family problems. However, prior to 1980, most central teaching texts interpreted pastoral counseling exclusively as individual

therapy guided by variations of psychoanalysis (Wise 1951, 1980), Rogerian client-centered therapy (Browning 1966; Oates 1962, 1974), or humanistic growth therapies (Clinebell 1966). Premarital counseling, marital counseling, and intervening with family problems were based on models of “enrichment” suggested by these individual therapies. One exception was Clinebell’s (1966) *Basic Types of Pastoral Counseling* which described new resources emerging from the family therapy movement that might be helpful to pastoral counselors. By the end of the 1980s, most pastoral counselors were aware of family therapy. Many saw it as a helpful secondary method of counseling, useful when counseling couples or families with problems. Pastoral counselor training programs began to require at least rudimentary knowledge of family theory and couple or family intervention. Some pastoral counselors enrolled in family therapy training programs mentioned in the previous paragraph. For these pastoral counselors, family therapy became a primary commitment rather than an occasional alternative to individual therapy. This paradigm shift was not universally welcomed by the pastoral counseling community. First, it challenged a theological preference for individual experience found in the liberal protestant theology that supported pastoral counseling theory (particularly Tillich and Niebuhr). Second, it questioned the ethics of a theology and psychotherapeutic approach to care (psychoanalytic and Rogerian) that prioritized depth, individual psychological analysis available only to the socially and economically privileged and which tended to ignore relational systems. Though willing to use some family therapy techniques for specific couple or family problems, most pastoral counselors resisted this significant shift from their historic and theological roots.

For pastoral counselors, interest in family therapy as a paradigm shift increased with publication of Rabbi Edwin Friedman’s book *Generation to Generation: Family Process in Church and Synagogue* (Friedman 1985). Friedman’s elegant application of Bowen’s intergenerational family systems theory to congregational life showed that family systems theory could be a

sophisticated, theologically informed alternative to individual psychological models. This text quickly became a standard for clergy training. It provided pastoral counselors an accessible introduction to “systems thinking” and lent legitimacy to assessment and treatment that was not based in depth psychology. In the 1990s, systemic epistemologies gained enough momentum to challenge long-standing preference for individual psychological paradigms. For example, feminist and LGBT pastoral counselors found contextual, systemic models helpful for evaluating power structures, challenging patriarchal systems, and deconstructing pathological concepts like the “schizophrenogenic mother” (Fromm-Reichman 1948). Multicultural family therapy (Hardy and Laszloffy 1995) offered pastoral counselors new ways to interpret gendered, racial, class, and sexual orientation differences in social context. Systemic family theory also began to influence the pastoral theologies that supported pastoral counseling (Graham 1992).

Since 2000, pastoral counselors have constructed important integrative connections between postmodern family therapy and postmodern theologies. These theological and therapeutic models pay careful attention to how all social meaning, including family interactions and beliefs, are constructed in specific social contexts. Instead of universal principles of counseling that fit all people or families, these postmodern integrations use, for instance, narrative and collaborative family therapy to interpret care of women (Neuger 2000, 2001), stepfamilies (Townsend 2000), and lesbian couples (Marshall 1997). They also directly critique pastoral counseling’s historic bias toward long-term and individualistic models of therapy (McClure 2010; Stone 2001).

Perhaps the greatest stimulus to connect family therapy and pastoral counseling was political. As healthcare changed in the mid- to late 1990s, payment for services required that a counselor be licensed. In all fifty states, family therapists lobbied successfully for licensure. Pastoral counselors gained licenses or certifications in only five states, which meant that most pastoral counselors needed a license in another discipline to

qualify for jobs in interdisciplinary counseling centers or to receive payments from health insurance companies. Many sought training that would allow them to obtain a marriage and family therapy license. Several theological seminaries and freestanding pastoral counselor training programs developed educational models that were theologically integrated and license eligible in marriage and family therapy. Increasingly, pastoral counselors are finding a vocational home by integrating pastoral values in their work as licensed marriage and family therapists.

Professional pastoral counseling is a discipline that has always borrowed psychotherapeutic theory and reflected theologically on its application to ministry (Townsend 2004). Today, pastoral counselors may choose a family therapy technique as an auxiliary to individual-oriented therapy practice or see marriage and family therapy as their primary theoretical commitment. In either case, theological or spiritual integration will define the pastoral counselor’s work. Pastoral counseling guided by family therapy will at minimum: (1) frame individual life in a family context; (2) assess and treat problems as systemic (a product of family and social systems) rather than individual psychopathology; (3) observe how families and problems are structured and maintained through intergenerational patterns, repetitive interactional sequences among family members, organizational/structural patterns, or the shape of family narratives within specific cultural contexts; (4) attend carefully to the family life cycle in assessment and treatment; (5) consider the entire family as the unit of treatment in counseling; (6) describe change as ecological – that is, it is intricately related to changes and influences in the whole family, community, and cultural system; and (7) expect the therapist to be a facilitator of systemic change rather than a psychological healer.

Family-Based Religious Abuse

Sana Loue

Faculty Development and Diversity, Department of Bioethics, Case Western Reserve University School of Medicine, Cleveland, OH, USA

Partner abuse may be physical, psychological, emotional, sexual, and/or spiritual in nature. In addition to any physical injuries, abused individuals may experience both short-term and longer-term emotional and psychological effects. Initial psychological responses may include shock, denial, confusion, fear, and depression. Resulting longer-term effects may include anxiety; fatigue; sleeping and eating disorders; feelings of loss, betrayal, and helplessness; and, in some cases, suicide. The injuries caused by physical violence, which may lead to disability and chronic physical pain, may intensify and/or prolong the psychological effects.

The relationship between religion and partner violence may not be easily apparent. Some scholars have speculated that individuals who adhere to a literal reading of scripture may be more likely to abuse their partner in some form. Numerous scriptural passages from the Old and New Testaments and the Qur'an, when taken out of context, have been used to explain or justify physical violence against a partner. As an example, Ephesians 5:22 provides "Wives, be subject to your own husbands, as you are to the Lord," and, when read literally, suggests that wives owe obedience to their husbands. While this might suggest that those with more fundamentalist religious beliefs would be more inclined to endorse and/or to utilize physical violence against their partners, research has not found this to be the case. In fact, weekly church attendance has been found to be associated with lower rates of partner violence.

In other instances, a partner's refusal to perform or respect a religious ritual may constitute a form of emotional or spiritual abuse. As an example, a husband's prevention of an Orthodox Jewish woman from visiting the mikveh (the ritual

bath) following a period of menstruation or his insistence on engaging in sexual intercourse before she has had an opportunity to attend the mikveh may be emotionally abusive. Similarly, a refusal by the wife to attend the mikveh following menstruation may be emotionally abusive of a religiously observant Orthodox husband who, according to religious precepts, may not engage in sexual relations with his wife following her menstruation until after she has attended the mikveh.

Researchers have found that abused individuals who are members of religious communities appear to be more vulnerable than abused individuals who are not members of religious communities. Victims of partner violence who are members of religious communities may turn first to their clergy and other religious leaders for support and guidance. However, many clergy are ill-prepared to address the violence effectively or to intervene and may respond to such requests for assistance by reference to scriptures and their understanding of scripture. Consequently, the victim of the abuse may be told to forgive the perpetrator of the violence and return to their marriage because marital vows are for life, to better adhere to the precept of the male headship of the home, and/or that he or she must have provoked the violence. A clergy member may also “spiritualize” the problem, suggesting that the violence was visited upon the victim as a punishment from God for his or her transgressions or moral failings.

Religion and/or spirituality may aid the recovery of survivors of partner violence. Researchers have found that institutional religious involvement by survivors of partner violence is associated with a higher quality of life, lower levels of depression, lower levels of posttraumatic stress, and reduced risk of suicide. A number of non-denominational interventions that incorporate elements of spirituality have been developed to support individuals as they recover from partner violence. In general, such interventions may incorporate elements that focus on the individual’s areas of strength, their image of God or a higher power, spiritual connection, spiritual struggles, and their spiritual journey and transformation. Interventions that are more rooted in a

particular religious perspective may also incorporate religious passages that provide support for recovery.

Fantasy

Aditi Dirghangi

Department of Humanities and Social Sciences,
National Institute of Technology Rourkela,
Rourkela, Odisha, India

The world of fantasy in general is believed to be an imagined “other” world created by an individual inside his mind. The individual is also the

protagonist in this world who accomplishes all his desires, new situations, possibilities, personal role, or a pattern of behavior in the inner framework of his mental screen. According to the Oxford dictionary, fantasy is a faculty of mind which indulges into an imaginative activity produced for the fulfilment of repressed desires and needs or future possibilities by an individual. The set of perceptions the subject envision are conscious or unconscious wishes, and fantasy acts as a mediator in articulating these images which are improbable in reality. The word fantasy is derived from the Greek word "*phantasia*," literally meaning "to make visible" and is also spelled as "phantasy." Fantasy and phantasy can be used interchangeably but the latter is used more in the psycho-analytic discussions. In one hand, fantasies are referred as the conscious wishes which are the part of everyday stream of thought, conscious day dreams, fictions, and so on which one creates and recounts in waking state. Whereas on the other hand, the term "phantasy," adopted into Freud's writing, entirely meant of the unconscious wishes which remain repressed in our unconscious and is not much in control.

Consequently, the term phantasy is placed in contrast with reality, and the importance of phantasy is undervalued as something only imagined or unreal. In general, reality is characterized by objective facts; likewise, phantasy reflects the psychical reality of the mental processes. But, Freud understood that the inner world of the mind has a reality of its own, with specific characteristics and laws, different from those of the material reality. The term psychical reality appears in Freud's *Interpretation of Dreams* (1990) which means a subject's resistance to material reality. In simple words, the psychical reality overpowers the material reality and the elements which overpower the reality are the subject's internal imagination which pictures the fulfilment of the both unconscious desires, controlled by the libidinal and aggressive instincts, and conscious desires like future possibilities, basic needs, and desires. Therefore, fantasies are an alternative reality which arises against the adversary situations of the material reality. It is also regarded as one of the defense mechanisms in psychoanalysis,

when a person uses fantasy as a motivation and an act of escape against unpleasant situations occurring. The concept of defense mechanism is originated by Sigmund Freud in his works, *The Neuro-Psychoses of Defence* (1894) and *Further Remarks on the Neuro-psychoses of Defence* (1896), and was later propounded by his daughter Anna Freud in her seminal work, *The Ego and the Mechanisms of Defence* (1937). It creates an "as if" world where the individual animates his wishes. For example, after being punished by his parents, a child may fantasize about running away from home as an act of retaliation against her parents.

The term phantasy is also significantly found in the works of Melanie Klein, she refers to phantasy as a prime motivator during a child's early stages of development. According to her, phantasies originate from genetic needs, drives, and instincts and appear in symbolic form in dream, play, and neurosis. Phantasy in an infant is modified by emotions in reaction to the internal and external reality and is projected in relation to the imaginary or real objects. Phantasies allow the ego in establishing object relationship and the infants make sense of the external world through introjection and projection, of the relatable object. Therefore, phantasy allows the infant to create an identity of their own and of the other, constructed through projection and introjection. Mitchell (1986) describes Klein's concept of how phantasies are the mental expression of instincts and phantasies derived from them are both physical and mental phenomena; "phantasy emanates from within and imagines what is without, it offers an unconscious commentary on instinctual life and links feelings to objects and creates a new amalgam: the world of imagination. Through its ability to phantasize the baby tests out, primitively 'thinks' about, its experiences of inside and outside" (23). Furthermore, Phantasies does not underlie only in dreams but also shapes the mental and physical activity and also modify the expressions of internal object relation and external event. Phantasies continue through infantile stage to adulthood offering an important part in identity formation. Klein (1975) expounds this statement as, "Infantile feelings and phantasies leave, as it were, their imprints on

the mind, imprints that do not fade away but get stored up, remain active, and exert a continuous and powerful influence on the emotional and intellectual life of the individual” (290).

Fantasy for infants takes shape in the symbolic form of play like pretend and pretense. Both are mental activities of imagination which creates an alternative identity projecting onto the reality. Pretend play is a physical and behavioral manifestation of pretense, and pretense is a mental activity. Few examples of the symbolic form of pretense are self-pretense, object substitution, animation of objects and pretending about imaginary other, pretending to be someone else, object substitution. Pretend play is a universal occurrence and pretending about imaginary other or fantastical being is one common pretend play exhibited by children across cultures. In this pretend play, initially the family provides themes for young children’s pretense but later as they grow up, they create the play themes of their own. Both adults and children are equally involved in the creation of the fantastical beings. Similarly, few cultures also create fantastical characters and introduce them to the children. In Western culture, there are several event-related beliefs in which fantastical characters become important. Few examples of such are, Santa Claus and the Tooth Fairy or some other fairies or monsters. Children involve in these rituals which are culturally supported by fantastical beings like hiding cookies for Santa Claus and believing that Santa will secretly leave gifts for them on Christmas Eve or searching for Easter eggs. By participating in such rituals serves a purpose for both the children and parents like, Santa ritual may serve as a behavioral control for parents, as in, if the child does not behave accordingly, the Santa will not give him any gifts. Many researchers believe that a child’s experience with these fantastical beings play an important role in the development of the faith and religiosity. Because through involvement in the rituals children start believing these fantastical or imaginary beings which cannot be seen, but through stories and myths they can be experienced. This idea of believing the fantastical is thought by many researchers as a facilitator to the belief in gods and other religious entities in the later growing stages of children.

William James in his work *The Principles of Psychology* (1981) was the first to identify the fantasy processes occurring within the stream of thought of an individual. He explicated this further as an image appearing in response to the recently perceived object, which triggers a set complex processes in the ongoing stream of thought. In earlier days, people believed that day dreams and fleeting imageries on the mental screen are actual visions, as omens or appearances of deities (Jaynes 2003). Few researches explain that prophetic visions like John’s “Apocalypse” or Eizekiel’s “wheel” are expressions of fantasies. But with the development in the field of modern psychology, fantasy is perceived as a mental faculty which serves as a mediator for wish fulfilment. Likewise, faith, divine beings, and rituals also become a symbolic medium of wish fulfilment. Religious traditions and rituals are imaginative mode of expression for wish fulfilment. Critics such as Paul Avis in his book *God and the Creative Imagination* (2005) postulates that Christianity is an imaginary religion by deducing the works of thinkers like Feuerbach, Marx, Nietzsche, and Freud. He further moves on to claim that beliefs and rituals in Christianity are nothing but illusion, projection of unconscious psychological tensions or conflicts. For example, Nietzsche asserts in his book *The Anti-Christ* (1968) that Christian ethicality and devotion has no contact with the reality, “. . . Imaginary, occult causes (god, spirit, soul) were supposed to produce imaginary effects (sin, redemption, forgiveness) within the framework of an imaginary purpose or teleology (kingdom of God, last judgement, eternal life)” (125). Therefore religion, like an imaginary process of mind, works as a compensatory for wish-fulfilment. The rituals, sacraments, and other traditions are a medium for bestowing god’s grace in the impression of wish-fulfilment.

Fate

Todd DuBose

The Chicago School of Professional Psychology,
Chicago, IL, USA

The concept of fate is as old as there is recorded literature about human interactions with the gods, crossing multidisciplinary boundaries. Whether natural phenomenon is anthropomorphized as shapers of life directions, or belief in supernatural providence as an explanation for wonders and woes, the experience of how one's life unfolds and of who or what (if anyone or anything) orchestrates it must certainly rank as the most primary of questions for human beings across history and culture. Embedded in any account of fate, Homeric, Shakespearean, sacred literature, or otherwise, is an accompanying declaration or puzzlement about fate's relationship to choice, agency, and freedom (Anonymous 2150 BCE/1960; Eliade 1959; Homer 600 BCE/1999; Shakespeare 1623/1937). Moreover, fate is usually discussed with a melancholic intonation signifying the limitations of averting tragedy, perhaps a hasty conclusion that could overlook liberating factors that ease the burden of existence when fated in the world.

Fate was originally understood as the pronouncements of the gods about how one's existence was to proceed. Along with this preordination of task and vocation came a melancholic resignation believing that fate equaled doom. Fate was either discerned through premonition, such as in dreams, or was an interpretation of one's life offered retrospectively, the latter process, of course, establishing a frame of reference for understanding future projections of existence.

There are several important points to explore about fate that are central to the field of psychology and religion. Some of these points of discussion include the place of freedom in fate, the possibilities of alternative views of fate other than despair over impending doom, and the relationship of ancient understandings of fate to more contemporary expressions of fate. The latter issue necessitates addressing whether or not existence is fated by macrosystemic, biochemical, or genetic determinants: our postmodern pantheon of gods.

An original pondering on whether or not we have freedom in the face of fate is what the ancient world considered as the "idle argument" in relation to illness and remedy. One can seek the care of a physician by choice, but if one recovers or not, the seeking of the physician is irrelevant. Recovery or illness is fated, no matter what one does in response to it. The same conundrum can be found in various theological positions related to predestination and providence and in how one views developmental theory. Are events the result of random chance or are they predetermined? Are they *absolutely* determined, even if one's development includes tragedy and suffering, and, if so, what would this imply about the gods? Is development and the place of divine – read as Otherness in various ways – intervention in that development a compromise between moderate determinism and free will?

These are ancient questions. Wisdom literature, Homeric literature, the Muslim will of Allah, Shiva's dance or Vishnu's Maya, ever-present and directing God, and the will of God the Father are only a small list of fateful descriptions that include wrestling with what seems to be fated. Struggling with what seems to be fated presupposes, as disclosed by the struggle itself, that one can argue with God, disobey the gods, or accept one's fate.

The latter advice is what came to be known as *amor fati*, or the admonition to love one's fate. Acceptance, though, is a choice, even if the aftermath of one's choice is inevitable or not. Fate, though, need not be explained as the effects of historical causality and, instead, can be described as the factual givens of our "thrownness" in any given situation, to use Martin Heidegger's (1889–1976) language (1962). Our existential givens as human beings situate us in each moment of our lives.

One may think that since the rise of scientism and logical positivism, and thus, the jettisoning of imaginal worlds populated by the gods as dictators of our daily happenings, we must be rid of external controls of freedom. On the contrary, causal displacement continues in full force. We are who we are as a result of our neurochemistry, our familial upbringing, our social construction, and our unconscious, among other unmoved movers and newer gods in our present situation. Moreover, there are fated aspects of choice itself. Jean-Paul Sartre (1905–1980) speaks of the condemnation to choose and the inescapability of deciding (1943/2003). Martin Heidegger (1962) wrote of the omnipresence of the call of conscience and the necessity of response, even if the response is an inauthentic privation of our projected being-in-the-world. Most importantly, for Heidegger, we are fated to die, which paradoxically invites a choice to live more fully. Life becomes full in our embrace of our situatedness.

It is paradoxical indeed when that which is given brings forth one's ownmost possibilities. Hence, despair need not be the only attunement to one's limitations and doom need not be the only outcome. Situatedness relieves us of our aspirations to be as the gods, which may be where most of the frustration lays for those whose like in kind projects are frustrated by fate. Even the gods fated to be as gods struggled with wishes for "more than" what was available to their situation. The irony, then, is that perhaps the most fated aspect of our lives is the inescapability of our freedom.

Resoluteness, for Heidegger (1962), is a comportment of agency within fated thrownness. Yet, fate, from this perspective, is not a causally driven phenomenon. It is created in my very resoluteness. I commit with openness, thus authentically

embracing my historicity. We are fated by our thrown situations in history, but we are also "fating" in our decisive and authentic commitments to and Sartre allegiances with our given *existentialles* as human beings. This kind of *fait accompli* is not merely an acknowledgment of where I find myself as a recipient of thrownness but also as one called to respond and thus historicize ones accomplishments. To be fated is to be historical, and to be fating is to be free and able to own our ownmost possibilities amidst our limitations as well as to co-create our situatedness through our resoluteness.

Commentary

The central aspect of discussions about fate related to the field of psychology and religion rests on the ancient understanding and critical redaction of how fate is a quality of relationship between the gods and humankind. Misunderstanding the meaning of being in this mythology and reducing these interactions to bicameral mindedness, as Julian Jaynes (1920–1997) (1976/2000) saw it, have not ceased politics with the gods – now understood as any external force that is presumed to determine one's destiny – neurology and macrosystemic influences being the two most prominent gods today. We now know of the plasticity of the brain and that its dendritic branching rewires itself throughout our lives, particularly in dialogue with how we make sense of situations. As much as we find ourselves fated by existential givens, we can also create fate that is not there, as when we disown accountability for our moment to moment decisions in co-construction of our various situations. Liberation from oppression would not occur at all without the capacity to descend, overthrow, or cease participation in hegemonic patterning.

Therapeutic responses to fatalism need not find themselves pinned between the false dilemma of free will versus determinism. Theologically, those in therapy speak of providential intervention in their lives and most often not explicitly using that word. Instead, we hear statements signifying varying degrees of providential influence with comments such as "there is a reason for

everything,” or “why did it have to happen this way, and why me?” or “this is simply not fair,” and, finally, “it’s all my fault.” We are still talking with the gods. When all is said and done, however, we are recipients of fate as much as we shape it. One could say that fate is surely co-constructed, even in each novel occasion’s invitation to create life as Alfred North Whitehead (1861–1947) would put it (1929/1979). Moreover, there are more available responses to us regarding our situatedness and historicity than hopeless resignation to impending tragedy, an interpretation made by our ancient predecessors to retrospectively make sense of traumatic experience. Even in the worst of traumatic experiences, we still have the burden or beauty to respond, and in doing so we find ourselves phenomenologically – though paradoxically – fated with freedom.

School of Theology and Ministry, Chestnut Hill,
MA, USA

Ancient Significance

Symbols of male and female parentage have been connected with the structure of the universe in religious and mythical imagination. In the understanding of many ancient cosmologies, the sky is seen as the father and the earth the mother, corresponding to the impregnation of the ground with rain and the earth’s generative capacities in producing plants (Jackson 1983, p. 88). In other ancient mythologies, the sun represents the male figure, while the moon represents the female (Jung and Kerényi 1949, p. 130). This identification of the terrestrial and heavenly forces with parental figures shows the importance of the original imprint of the parent upon the psyche of the culture.

However, the influence of the father has also come under close scrutiny. In discussions of pre-historical understandings of parenting, the debate has centered on questions about the father’s role in procreation. On the one hand, some scholars suggest that the father had no understanding of his role in the conception of children, and women were seen as having mythical powers which

sustained humanity, and that “man’s part in this process was not as yet recognized” (Stone 1976, p. 11). Such a perspective is reflected in the Christian narrative about the birth of Jesus, in which the ostensible human father plays no procreative role. On the other hand, some scholars insist that the lack of understanding about biology in ancient times lent itself to the interpretation that men were the sole progenitors of children, women being simply receptacles for the man’s creative powers (Morton 1985, pp. 35–36). This interpretation is reflected in Zeus’ conception of Athena from out of his head or the birth of Aphrodite from a severed phallus. As speculative as these debates have been, they reflect the ambivalence surrounding the relationship of the male parent to his progeny.

The Changing Images of Fathering

In modern times, the father’s role in the family has been equally uncertain. Moving away from a unified idea of masculinity, the current period is experiencing flux as traditional patriarchal societies around the world come under challenge (Morgan 2002, pp. 280–281). The significance of the father has changed with the shifting involvement of fathers with their families and the cultural conditions in which the father interacts with a particular family. Psychology and culture are interrelated, as repeated patterns of fathering have psychological effects that produce sons who father in similar ways (Chodorow 1978, p. 36). Nevertheless, significant shifts have also occurred over the last several centuries in how men in the United States father their children (Lamb 2000, p. 338).

In the early history of the United States, the father’s primary responsibility was “moral oversight and moral teaching,” namely, the cultivation of education for the purpose of studying of Scripture (Lamb 2000, p. 338). Many Asian cultures continue to retain the image of father as moral guide and authority, with strong meanings associated with fatherhood and obedience (Zhao 2007, pp. 72, 128). In the United States, this vision of fatherhood changed as industrialization moved

fathers out of the home with their primary role becoming that of providing financial support. As many Black American men had to travel long distances to work in northern cities, this created a “father absence” for the sake of this breadwinning role (Lamb 2000, p. 338). The 1940s brought a new understanding of fathering which depicted the necessity for fathers to be a “sex-role model, especially for [their] sons” (Lamb 2000, p. 338). This interpretation, and the literature which it spawned, highlighted the “presumed or declared inadequacy of many fathers” (Lamb 2000, p. 338). Finally, as a result of the feminist movement, there has been a stronger emphasis on the nurturant roles of fatherhood. This has corresponded with more actual involvement of fathers in the lives of their children, especially when both parents work outside of the home (Lamb 2000, pp. 338–339).

All four of these images of fatherhood continue to play significant and often interchanging roles in the actual practices of fathering. Fathers often feel pressure both from within themselves and from the wider culture to exhibit aspects of these fathering styles that are consistent with cultural expectations of fatherhood.

Psychological Views of Father and Religion

Freud believed “God” reflected the projection of a wished-for father figure, so that “the longing for the father was the root of the need for religion” (Freud 1927/1961, p. 28). Freud calls God a “father substitute. . . a copy of the father as he is seen and experienced in childhood,” before one’s ideal image of one’s father is challenged (Freud 1923/2001, p. 46). This need for a father substitute came with a great deal of ambivalence, as can be seen in the mythology that Freud proposes. He suggests that in ancient times the “primal horde” of brothers conspired together and killed the father and that his power entered a totem animal that was sacrificed and shared so that his power could be distributed to all participants (Freud 1927/1961, pp. 28–29). In a similar vein, Freud suggested that Moses, as the father figure of the

Jewish faith, was actually murdered by the Israelites and that his invention of monotheism was the great act of religious genius through which the image of the “repressed” primal father who had been killed could again be returned to consciousness (Rizzuto 1979, p. 20). This theory was a direct reflection of the oedipal drama, a “competitive sexual and aggressive conflict” in which the boy desires to take the place of the father in the family constellation (Mitchell and Black 1995, p. 47). The ambivalence which attended the psychic representation of God the Father required that the “Devil” appear to absorb those qualities of envy and fear which were not adequately addressed in worship of a single God (Rizzuto 1979, p. 20).

Freud’s original hypothesis has been revised in a variety of directions by subsequent psychoanalytic thinkers. Most agree that the father becomes represented in the psyche in an important manner which is reflected in the person’s image of the Divine. In one case, David Bakan highlighted the father’s ambivalence about his children, including his fear of being rejected by them, suggesting a hidden theme of infanticide in the book of Job (Bakan 1968, pp. 110, 116). Ana-Marie Rizzuto claimed that Freud’s religious ideas were based upon the projection of his own disillusionment with his father and described how the God representation should be able to transform beyond the image left by a particular parent (Rizzuto 1979, pp. 46–47; Rizzuto 1998, pp. 51–52). In a quite different approach, Jung saw the male element and female element as universal oppositional principles within the personality that needed to be reconciled (Jung and Kerényi 1949, p. 130). For Erik Erikson, the absence of a father to idealize led to his emphasis upon identity and the challenges that interfere with its formation, a theoretical agenda which found its fullest expression in his treatment of Martin Luther’s father complex (Capps 1997, p. 210; Erikson 1958, p. 70).

With the advent of ego psychology and object relations theory in the middle of the twentieth century, the emphasis within psychoanalytic psychology shifted from the oedipal phase to the preoedipal, and increasing significance came to

be placed upon the mother (Mitchell and Black 1995, p. 47). The significance of the shift cannot be separated from the sociocultural factors of the postwar period, in which the enshrinement of “motherhood” was connected with an effort to preserve the stability of the nuclear family within society (Chodorow 1978, p. 5). One result of this was that fathers were seen to have little place in actual caregiving but were a “third” element, which introduced the child to the outside world, establishing the gender identity of sameness with the boy child (Mitchell and Black 1995, p. 257). Recent psychological discoveries have shown that fathers may have a more important role in the development of children, even in the preoedipal period (Phares 1999, p. 26; Lamb 2000, p. 340).

Implications of Changing Views of Father

The Judeo-Christian religions have traditionally portrayed God as a male father figure, but the hegemony of this imagery is breaking up. Accordingly, fathers are in the midst of a shifting position, both in terms of their gender roles and self-definitions. As cultural trends continue to move toward equality between genders, fathers are increasingly providing care for children (Lamb 2000, p. 339).

The historical legacy of fatherhood has emphasized competence and power outside the home but immaturity, weakness, and volatility at home. Fathers are frequently portrayed as incompetent in their fathering by the media, and they often seem to struggle with an internalization of this image (Mackey 1985, p. 126). Fathers also contend with issues of rage and abuse, as the cyclical patterns of violence are handed down disproportionately by men (Cooper-White 1995, p. 165).

With all of these indictments admitted, not enough attention has been paid, especially in depth psychology, to the significance of the father’s expanding caregiving role in the lives of his children or the manner in which this caregiving becomes a part of the father’s identity (Lamb 2000, p. 339). Positive psychological outcomes are associated with high involvement of fathers in

caregiving practices (Lamb 2000, p. 340). With the increase of caregiving behavior among men in our society, along with a refashioning of traditionally patriarchal religions through an encounter with feminist thought, it remains to be seen whether the personal influence of fathers in the home will lead to a transformation of both psychoanalytic theory and the forms and symbols of religion.

Fear

Glenn H. Asquith Jr.
Bethlehem, PA, USA

After a brief definition of fear, this entry will explore functions of fear, spiritual and psychological meanings of fear of God, and religious responses to fear of death. It concludes with a summary of how religious ritual addresses fear.

Definitions of Fear

The medical dictionary definition of fear is “an unpleasant often strong emotion caused by anticipation or awareness of danger and accompanied by increased autonomic activity” (Merriam-Webster.com 2012). This raises several concepts that require further examination and discussion. The first is that there is a difference between fear and anxiety.

Fear is a normal and healthy response to a real threat to one's life or well-being. If I am walking in the woods and I am confronted by a bear, my aroused alertness allows me to make a response for survival or protection. Anxiety is the fear of something that may or may not happen. If I never go hiking in the woods because of the fear of confronting a bear, I am controlled and limited by my anxiety.

Fear is processed in the human brain's amygdala, which controls memory and emotional reactions. This means that fear is a learned or conditioned response; certain stimuli raise the emotion of fear based on past associations with those stimuli. We learn what is dangerous to us, and certain events, objects, and situations become associated with fear. If fear of a certain stimulus is a conditioned response, it can be reduced or extinguished by techniques such as systematic desensitization.

A frequent goal in pastoral counseling is helping persons to discern the difference between fear and anxiety and to decide upon a healthy response to each. A person might be afraid of the reaction of parents, spouse, siblings, or co-workers to their opinions, decisions, or behavior. The task is to move toward a realistic perception of these threats and thus be less controlled by unnecessary fear in living their life.

Another example is the fear experienced by persons with posttraumatic stress disorder (PTSD). A post-combat soldier with PTSD reacts with fear at the sound of hometown holiday fireworks because the sound takes him or her back to the battlefield, with all of the attendant feelings and fears associated with that experience. A person who has been physically or sexually abused will react to an aggressive individual with the feelings associated with the abuse instead of the present reality that is faced. A goal of therapy is to help the person develop skill and perception in staying "in the present" and thus make a realistic distinction between present situations and situations that trigger fear based on past experiences.

Functions of Fear

As suggested above, fear, like anger, can function as a positive emotion. Anger that is not managed well becomes destructive to relationships and health, but it also functions as a motivator to correct an injustice. Likewise, overwhelming fear can cause paralysis and an inability to act, whereas healthy fear is necessary in order to

function effectively and decisively in the face of real danger; it is a necessary component of survival.

Austrian skydiver Felix Baumgartner, nicknamed "Fearless Felix," recently completed an 18-mile skydive in which he reached a free-fall speed of 536 miles before deploying his parachute and landing safely. This was done in preparation for a 23-mile jump from space that will break all records for skydiving, including reaching a free-fall speed that will break the sound barrier with his body. To complete this, he will be using a newly developed space suit that must remain completely airtight in order to prevent his blood from boiling in the rapid descent. Baumgartner, a very experienced skydiver, is fully aware of the dangers and risk of life involved in this dive. When asked if he was afraid, "Fearless Felix" responded that of course he is afraid but that healthy fear is necessary in order to properly prepare. He went on to say that his fear is overcome by courage – the courage to contribute to the successful development of a suit that will make space travel more safe for future astronauts (ABC News 2012).

Fear of God

In psychology of religion, "fear of God" might be seen as the same positive force in one's life as Baumgartner's healthy fear that literally spurs him to greater heights and contributions in life. Wisdom literature in the Hebrew Bible viewed fear of the Lord as the source of wisdom and knowledge; it leads one to depart from evil (Prov. 1:7, Job 28:28). In Christianity, the Apostle Paul used this phrase in 2 Corinthians 5:11 to refer to the believers' faith and devotion to God in the same way that it was used to describe the postexilic faithfulness of the Israelites. It reflects a full awareness of the majesty and power of God, who promotes justice, opposes wickedness, and expects accountability. Like Baumgartner, living "in fear of the Lord" means respect for the power of God that motivates one to do the

right thing and take seriously what is required of us.

German theologian Rudolf Otto (1958) was among the first to clearly articulate the relationship between nonrational feeling and ethical practice in religious experience. He referred to the nonrational awareness of the tremendous, the awful, and the mysterious as the *numinous*, the *mysterium tremendum*. *Tremendum* (tremor or fear) contains the element of awe or dread of the demonic-like wrath of God that can destroy enemies or those who disobey God; this is the primary basis for the Hebrew understanding of “fear of God” as described above. *Tremendum* also involves an overwhelming sense of the majesty of God as described in Psalm 8. Otto (1958) notes that this is akin to Schleiermacher’s understanding of “creature-feeling” or feeling of dependence upon the Creator for one’s very being and existence. It is the mystical awareness of the self in relationship to a transcendent reality. It is an awareness of a divine Energy that can powerfully love or powerfully destroy in the same fashion as Goethe’s view of the demonic.

A primary dimension of Otto’s view of *mysterium*, or mystery, is God as “wholly other.” This wholly other is a divine being, a divine presence that is beyond human rational comprehension. That which we don’t understand invokes fear in the negative sense; the phrase “knowledge is power” infers that we are less afraid of that which we understand. Especially in the Western world, any supernatural power, involving spirits or “ghosts,” is feared for its possible connection to evil or the demonic. Christianity reframed the cultural view of “spirits” with the concept of the Holy Spirit as an aspect of the nature of God. The Holy Spirit functions to defend one in time of trial or danger (the Paraclete in John 14:26) or to empower individuals or the body of believers (Acts 4:31). The transcendent but empowering nature of this wholly other God is felt but not fully understood; it inspires ethical practice in the positive meaning of “fear of the Lord” (Otto 1958).

Fear of Death

A primary fear in human experience is fear of death or, perhaps more accurately, fear of one’s mortality. Fear of mortality can cause compulsive work or activity, with the mistaken assumption that the more we do or produce, the more we have discounted the power of our mortality. Compulsive work is fueled by a religion that believes in salvation and righteousness only through works, through which one can maintain an illusion of omnipotence. Wayne Oates pointed out that this illusion “tends to erase awareness of personal death and leaves us with the assumption that we are not only all-powerful but immortal” (Oates 1971).

In psychology of religion, religious ritual and practice serve as a buffer against the fear of death. Wink (2006), in a study of 155 Christian men and women in their 80s, found that traditional, church-centered religiousness, as opposed to deinstitutionalized spiritual seeking, served to allay fear and anxiety about death. This raises the question debated in psychology of religion as to whether fear of death brings people to religious belief. Citing several studies on this question, Fontana (2003) concludes that “there is no strong evidence that religion is particularly sought as a defense against fear of death, even by those who have been or currently are close to death.”

Related to fear of death is fear of eternal damnation as a basis for religious practice. The Roman Catholic Church developed an elaborate doctrine related to the fate of souls after death. Catholics were required to receive the sacrament of last rites before death as a last chance to repent and receive forgiveness before their postmortem journey. However, this practice still did not guarantee direct entry into heaven; most souls would spend time in a state of purgatory to expiate their sins. The faithful would gather after death for a mass of Christian burial, asking God to mercifully shorten this purification period (Garces-Foley 2010). In the Middle Ages, the misrepresentation and selling of indulgences to speed this process was one practice that led to the Protestant Reformation.

Following the Reformation, the Puritans who settled the early colonies of the United States lived in anxious fear of eternal damnation, fueled by the Calvinist teaching that all humans are utterly depraved and only the elect would be saved. Because no human knew who the elect were, vivid teachings of hellfire and damnation dominated religious practice in the early colonial period as people made every effort to be spiritually prepared for death, still uncertain of their ultimate fate. The evangelical revivals of the early nineteenth century proclaimed that salvation was available to all who repented, not just the elect, and death became seen as a homecoming, where all could enjoy the presence of the Lord and other loved ones who had died before them (Garces-Foley 2010).

Fear and Religious Ritual

Although Freud famously proposed that religion was a neurotic defense against fear and other feelings and impulses, Fontana (2003) cites other evidence to show that “far from being neurotic, ritual is an inborn psychological propensity, shared by all cultures, to mark life’s transitions, to strengthen social relationships, to cope with misfortunes, and to respond to life’s mysteries.”

This conclusion is reinforced by multiple studies of the use of religious ritual across cultures and faith traditions. In the Jewish tradition, life’s passages as well as a person’s relationship to God and to family are celebrated with careful observance of regular rituals such as the Sabbath, Passover, and Yom Kippur, the Day of Atonement. Yom Kippur is the holiest day of the Jewish calendar, in which Jews prepare for the inevitability of death by taking account of their life and making restitution with God and with other persons for misdeeds of the prior year (Alpert 2010).

In the Hindu tradition, the death ritual is considered the most important life cycle event. The death ritual confirms the Hindu belief that death is a part of life that happens to everyone. These rituals facilitate the deceased soul’s transition from this world to the next and ensure the continuity of family lineage. As in other traditions, the rituals are performed for the living as well, so that

they can go on with their lives in the assurance of this continuity and transition. Finally, the rituals allow Hindus to maintain their cultural identity, even in the midst of primarily non-Hindu societies (Murata 2010).

Feeling

John Ryan Haule

C.G. Jung Institute Boston, Chestnut Hill, MA,
USA

The conscious registration of an emotion or affect. Emotion is a physiological state of arousal governed by the brain's limbic system that places the body in an attitude of fear, rage, lust, disgust, etc. Emotions are automatic responses that occur before an individual has a chance to think about what is going on. Feeling occurs as the conscious recognition that an emotional state is already in effect.

In Jungian psychology, feeling is – along with thinking, sensation, and intuition – one of the four “psychic functions” for apprehending the two worlds: inner and outer. While “sensation” (the five senses) determines that something is there before me and “thinking” determines what it is, feeling *evaluates* the people, situations, and objects that I meet. Feeling establishes that something is attractive or disgusting, benign or threatening, gratifying or enraging, etc., and it does so on a hierarchical basis, determining which object is more lovable or inspiring than another. Because it sets the world in order, Jung calls feeling a “rational” function, along with thinking. Sensation and intuition are “irrational” in that they only register the psychic facts that come before one, establishing no order among them.

In using the rational, ordering capability of feeling, an individual may remain self-possessed and take charge of the circumstances that present themselves in the moment. By contrast, emotion occurs as a psychological “shock” that lowers the level of mental functioning and narrows the field of awareness. Adequate everyday living, therefore, requires a capacity to use one's feeling in order to survey in detail the full world picture unfolding before one without the distortion of an overwhelming emotion. A differentiated and dependable “feeling function” is essential for satisfying and nuanced interpersonal relations and for social behavior, in general.

All schools of mysticism devote significant attention to training their students in differentiating the “introverted” aspect of the feeling function – that is, in applying the feeling function to make accurate assessments of one's own states of consciousness. Eastern schools take prominent note of the fact that an unmitigated emotional response always involves an attachment to a certain outcome or favored states of affairs. In training for detachment and the cultivation of equanimity, they make the differentiation of the feeling function possible. Meanwhile, most Western mystical traditions place “discernment” among the most valuable tools for advancement. For example, St. Ignatius of Loyola's “rules for the discernment of spirits” employs a detached feeling evaluation of one's own recent mental states – whether they are relatively “consoling” or “desolating” – to assist one in removing obstacles to advancement and in determining “the will of God” for one in the present moment.

Feeling is arguably the most important psychic function for every religion, from the decisive experiences of its founders to everyday decisions in the lives of its adherents. Longing for succor and transcendence; awe, fascination, and trembling before that which is wholly other; bliss in union; and abasement in shame, guilt, and unworthiness – at bottom, it is feelings like these that characterize religious attitudes and inspire mythic narratives, theological constructs, and ethical codes.

Female God Images

Annette Peterson
Riverside, IL, USA

Female God images can serve to balance the predominantly male God images of Western monotheism. Women who have not been equally supported to see themselves in personal relationship with the divine may need to express anger at the dominant religious paradigm and explore alternative images that express their sense of connection to the divine as female.

The lack of feminine God images in contemporary Western society is a common stumbling block for women's spiritual development. Religious historians wonder why God is so commonly depicted as male when feminine God images are as prevalent throughout history and may actually precede masculine ones (Baring and Cashford 1991; Leeming and Page 1994; Billington and Green 1996). Those who seek images of the feminine divine discover an abundance of goddesses and female archetypes in the historical record. Ancient images of the divine are frequently primitive art celebrating generativity and birth. Archaeologists have uncovered pottery and cave art of the round fecund female figure, earthy and full of life. In countless early paintings, a pregnant female body gives birth to the family tree. Finds like these substantiate the claim that the divine feminine was worshipped prior to a shift towards masculine images of God (Edinger 1996).

In Eastern religious traditions, goddess images are still abundant. In Hinduism, there is Devi, Shakti, and Kali. In Buddhism, the goddess Tara

has a variety of faces and traits. In the ancient West, the Egyptian goddess Isis and Sophia, the Gnostic goddess of wisdom, enjoyed popular appeal. In the modern West, female God images have dwindled. As the West coalesced into the major monotheisms, Judaism, Islam, and Christianity, God became a unified male figurehead.

The lack of female God images in the Judeo-Christian West dates back to Biblical times. Female references to God in the Bible never occur as names or titles for God. They occur only in the form of similes (Isaiah 66:13), metaphors (Numbers 11:12; Deuteronomy 32:18), analogies (Isaiah 49:15), or personifications (Proverbs 8).

It appears that although the goddess Sophia had a rich lore surrounding her, Jesus and the male Logos later supplanted her identity and role. In *Mirror of His Beauty: Feminine Images of God from the Bible to the Early Kabbalah*, historian Peter Schafer (2002) asserts that both Jewish and Christian traditions have wrestled with the question of God's feminine nature from the time of the Scriptures throughout the Middle Ages. Schafer argues that Jewish mystical conceptions of wisdom and God's femininity share attributes with Gnostic Christian writings and even reveals cross-pollination of ideas between the religions. He identifies similarities between the Christian cult of Mary and the Jewish Bahir, which stresses the feminine nature of Shekhinah, God's earthly presence.

Female God images tend to focus on the maternal role, rather than other sexual/personality gender differences. Propagation and nurture are emphasized. For example, Virgin Mary is preserved as a maternal rather than a sexual female figure. Erich Neumann (1955/1963), a Jungian analyst, believed that there were two major characteristics intrinsic in the archetype of the Great Mother: the elementary (belly/womb) and the transformative (breast). These images call to mind the fertility icons of ancient civilizations and do little to bring sources of feminine identification outside the traditional role. Women have been traditionally linked with the body and the earth, thus representing humans' lower functions. Because of this, women have often been

associated with the dark, irrational, or corruptible aspects of our personalities, such as the Genesis story depicting Eve's role in the Fall of Man. Yet it seems appropriate and natural to link feminine images to the earth and to God's indwelling presence in the world. Fecund and sensual, women and earth share generative capabilities in acts of creation and renewal, giving birth and bearing fruit.

Although feminine God images have likely existed for as long as religion itself, in Western culture they represent an undercurrent rather than the mainstream. Cults of the Goddess thrive in pagan or nature religions. Goddess imagery is willing to acknowledge the sexual power of women and the sex that leads to motherhood.

Feminist authors have provided resources for the exploration of the divine feminine in books such as *The Feminine Face of God* (Anderson and Hopkins 1991) and *A God Who Looks Like Me* (Reilly 1995). These authors challenge our indoctrination into a masculine theology. Reilly proposes that the masculine God image, culturally dominant for centuries, leaves a damaging legacy for women. That legacy is a learned belief in the exclusion, inferiority, and dependency of their gender. Girls imprint these cultural mores at an early age: Boys can be like God; girls cannot. Girls can be part of mankind, but not the part that is mentioned. Without available identification with God, girls can grow up feeling second rate. This legacy of male religious privilege enjoys mutual reinforcement with patriarchal political and familial power dynamics, perpetuating a culture of gender inequality.

For example, in the Catholic Church, where exclusively male priests preside over the Mass, girls and women are deemed unfit for the Church's highest calling. Traditions of male leadership serve to reinforce the maleness of Jesus and God the Father, who together are the ultimate creator, authority, and redeemer. In contrast, the female Catholic icon, Virgin Mary, is in a comparatively peripheral support role, valued mostly for her maternal function. Since both the Father and Son of the Holy Trinity are male, girls may learn to believe that females need men to save them. When these girls become women, they may chafe under

these gender dictums and seek the balancing, corrective experience of female God images.

Many find that female God images offer a warm acceptance that sets them at ease, feeling cosmically protected and cared for. Good mothering makes children feel nurtured and accepted, and as adults, we can derive a sense of safety and security from a protecting maternal God. Some people have replaced the doctrinal male God with a warmer, more maternal personal God. Perhaps surprisingly, this shift often occurs without leaving the community offered by their organized religion; instead, a quiet internal knowledge of the feminine nature of God is carried within. This occurs either consciously, for women who are tired of bearing an indirect image of God, or unconsciously, as men and women call upon God for maternal comforting and understanding.

Commentary

When a person cannot feel a sense of identification with her God image, her sense of self is weakened. Many women have been raised with a masculine God image that may have felt patriarchal, distancing, and demeaning. A God image with characteristics of both genders is part of a healthy, balanced spirituality. The preeminence of masculine God images can be dangerous and destructive to religious culture as well as our larger society.

While a man can relate to a male God by identifying with an idealized God image, a woman's relation to the deity is more indirect and even implicitly sexualized. There is a once-removed complexity to being a woman in relation to God when God is a gendered male, requiring a mother, daughter, or lover relationship instead of a simple identification. In the Gospels' Jesus narratives, women such as Mary Magdalene are hailed for their support roles, but not for their leadership. These traditional examples are offensive to many contemporary women for the way they influence current and future gender roles.

It is interesting to examine the roots of this gender inequality. In *The Alphabet versus the Goddess: The Conflict between Word and Image*,

author Leonard Shlain (1998) proposes that the written word is essentially a masculine enterprise, based on its “linear, sequential, reductionistic and abstract” characteristics; thus, all “writing subliminally fosters a patriarchal outlook.” In contrast, our mental images are perceived wholly all at once, as a synthetic gestalt, which Shlain identifies as essentially feminine. Evidently, our methods of perceptions and communication are as influential as its content.

Do writing and the alphabet cause or reflect the masculine skew of the collective psyche? Shlain argues that his causal theory is the most plausible explanation for the correlations he reveals between alphabetic writing and patriarchy. Although it would be extreme to suggest that language is a tool of the patriarchy, Western language patterns reflect a clear masculine skew that affects all people’s psychological constructs.

In therapy, if gender issues are behind a woman’s negative relation to her God image, it is helpful to examine the sources of this alienation on the larger culture. The therapist can then point out some alternative images, examples of the divine feminine that are present in the culture of the individual experience of the client.

Culture and religion, whether consciously or unconsciously, are engaged in mutually reinforcing gender bias. Influences of the ambient culture shape the individual’s religious expression. This helps us understand why many Christians unconcernedly attribute feminine traits to the male-gendered God images, subsumed under a masculine Godhead. A common example is the tendency to credit a masculine God for acts of creation and generativity, ignoring the feminine nature of these important roles. Rather than subsuming feminine traits within the masculine identity of God, it is psychologically healthier to acknowledge and celebrate the presence and contribution of both the male and female aspects of the divine.

Femininity

Elizabeth Welsh

Fuller Graduate School of Psychology, Pasadena, CA, USA

Introduction

Femininity or womanliness refers to the physical and behavioral qualities characteristic of and considered appropriate for women. In recent years, these attributes have fallen under the label of socially constructed “gender” and as such have been distinguished from the biologically

determined features of the female sex. This view has attempted to argue for an androgynous psychosocial quality of human nature and to relocate masculine and feminine functions in all human persons. However, in Western cultures femininity and masculinity have been treated as the two opposite ends of the spectrum of human personality and furthermore that the former resides in females, while the latter resides in males.

Current Views on Femininity

In general, the popular understanding of femininity is made up of an amalgam of factors. In the biological category, femininity or femaleness consists of genitalia, high voice, less body/facial hair, less muscle mass and more fat (though thinness has become a new desired characteristic), and more estrogen than testosterone. In the category of parenting roles, femininity is associated with mothering which consists of providing nurturance, warmth, and care. In the social sphere, femininity is associated with the public role of worker (as opposed to boss) and the private role of wife and mother. Finally, in the personality category, feminine behavior has been associated with emotional expressiveness; feminine attributes have been generally classified as soft, tender, and vulnerable; and feminine attitudes have been characterized by more subjectivity than objectivity. While these comparative differences between femininity and masculinity are relative, Western cultures have generally reinforced conformity to these dichotomous norms.

The fact that some of the above characteristics of femininity are purely biological, while others have clearly been socially designated, has had a confounding effect on colloquial designation of what is female (or male). Thus, beginning in the 1970s, the term “gender” has been used in psychological and sociological research to refer to the nonbiological traits, norms, and stereotypes that are considered typical and desirable for those who are designated as female or male. Since then, the academic literature has made efforts to clearly separate the terms “gender” and “sex” although colloquially they frequently continue to be used

synonymously. While it may not be possible to fully separate the biological aspects of human identity and experience from the social, cultural, and psychological ones, many attempts have been made to discriminate between them so as to understand the relationships between them and to correct the misrepresentations of women and men that have been at the root of much of history of oppression and violence towards women.

While some of the representations of femininity can vary from culture to culture, such as the specific physical features as well as behaviors that are considered desirable, certain common themes, such as beauty, gentleness, and nurturance, appear to underlie its diverse expressions. In recent years, the concept of femininity has come under the close scrutiny of feminists who have pointed out that the cultural prescriptions for ideal feminine qualities have been carefully scripted to serve the perpetuation of the patriarchal order. As such, the complex aspects of the feminine gender which appear to be mysterious and threatening to the established male order are split off and rejected and replaced with seemingly benign ideals of feminine docility, domesticity, and conformity. However, such restrictions have in fact been violently suppressive and have engendered oppressive attitudes towards women as well as men who do not conform to the traditionally patriarchal stereotype of masculinity. More recently, feminists have sought to challenge any universal definitions of femininity since no matter how empowering they may seem to be, they can always be turned into oppressive labels and scripted roles that ultimately restrict women’s freedom.

The Role of Religions in Shaping Femininity

Since religious beliefs and rituals have always played a crucial part in the formation and transformation of culture, their influence on sex and gender roles cannot be overstated. In the ancient polytheistic world, goddess worship was widely practiced. Some scholars have argued that goddess worship began much earlier, during the

prehistoric era when matriarchal social systems are also believed by some to have existed. However, while there is not any clear evidence of a single "Great Goddess," in cultures outside the Judeo-Christian traditions, the Feminine Divine was an intuitive and prevalent concept and some cultures have maintained it to this day under different names and shapes (Schaup 1997).

A cult of a prominent goddess as well as her loving union with a male god was present in all ancient Oriental religions. In ancient Egypt, the Goddess Isis was the creator of the world, and her sacred wedding with the male god, Osiris, was believed to hold the secrets of life and death. In the southern Mesopotamian civilization of Sumer, the goddess Inanna was worshipped and her union with son-lover Dumuzi and later the Assyrian-Babylonian Ishtar and Tammuz. The goddess Kybele was revered in Asia Minor and in Rome under the name of Magna Mater, the Great Mother. The main goddess of the Phoenicians, Philistines, and Moabites was Astarte or Asherah whom some of the Israelites worshipped as well. The Greeks had the powerful goddess of fertility and transformation, Demeter; the Greek Goddess of Wisdom, Pallas Athena; and the jealous and vengeful goddess of marriage, Hera.

The goddesses worshipped represented a myriad of associations which indicates that the ideas about femininity in the ancient world were quite diverse. One goddess alone could serve a variety of functions. For example, in Egypt, the goddess Isis was the goddess who gave birth to the heaven and earth, the source of pharaoh's power, and patron of nature as well as magic; the goddess of orphans, slaves, and the downtrodden; as well as the goddess of simplicity. Corresponding to these powerful and influential goddesses, women appeared to have the opportunities to hold positions of honor such as in ancient Egypt where women could be traders, craftswomen, priestesses, and queens.

The semblance of a goddess appears in the Old Testament as the concept of Wisdom – Chokhma (Hebrew) – Sophia (Greek), an autonomous female figure which emerges in the books of

Proverbs, Ecclesiastes, Job, as well as the apocryphal books depicting the Wisdom of Solomon. The Wisdom tradition featuring this female figure developed after the Babylonian captivity which seems to support the view that she was an adaptation of the foreign customs of the cult of the Goddess practiced in Babylon. This Divine Wisdom is depicted in the biblical text as authoritative, gracious, lovely, powerful in action, and a beloved of God and of mankind. At times she is portrayed as a divine person in her own right (Proverbs 8, Wisdom of Solomon, 7–8), but at other times she represents instruction, admonition, and fear of the Lord (Proverbs 2). Although the Old Testament authors could not conceive of a distinct Feminine Divine as in the old religions, they did however apprehend of a certain feminine Divine Wisdom which was close to God, sat besides God's throne and would decide for him what to do, was implicated in creation, loved human beings, and bestowed bountiful gifts on them. Overall, one may observe that this feminine figure wavers between a godlike figure endowed with attributes of regal power and loftiness and the image of a homely housewife, virtuous and industrious, a model faithful fulfillment of the law. Some have pointed out that a split took place; on one hand the idea of Great Goddess of the ancient religions, the source of all life and wisdom, continued to exist in the biblical figure of Wisdom, but on the other hand she was modified and reduced by Old Testament authors to narrow morality, submission, and prudence. Furthermore, in an implicit fashion, on one hand the feminine idea depicted in the Wisdom literature has divine qualities, but on the other she is depicted as rotten, the beginning of all sin (the "foreign woman," the harlot, the idolatress, the temple prostitute, and other derogatory terms that were used for the priestesses and other female worshippers in the temples of the pagan goddesses).

The case of Lilith is a possible illustration of this split. Lilith, Adam's first wife, was the woman who rejected her position of sexual and social subjection to man. While originally she represented female strength and autonomy, over

time, Lilith incorporated a myriad of dreadful qualities and thus became the shadow of the feminine which Israel was no longer able to integrate because it had split off and rejected along with the entire cult of the great pagan goddesses. Lilith became the antithesis of Eve, the submissive helpmate of Adam, and the positive model of a Jewish wife. From an interpretive standpoint, for the Jewish men in captivity, Lilith raised potency fears and threatened to endanger the physical survival of the nation in exile. She was henceforth transformed from a figure of female autonomy to one of purely evil qualities so as to make her abhorrent to women (one who murdered children and pregnant women) as well as men (the woman who withholds herself and causes semen to be spilled). The myth of Lilith entered many cultures under various forms from a witch to a beautiful seductress.

The split between an ideal virtuous femininity and a sexual, desiring, mysterious, and powerful woman was perpetuated in Christianity through the veneration of the Virgin Mary. As various feminists have pointed out, the image of the desexualized, suffering, and silently loving Virgin Mother who is lifted into heaven continued to pose problems for ordinary women since it constituted an ideal that alienated women from their real selves and from the realities of the misogynistic cultures in which they lived. The mild, gracious, and ethereal Madonna could only offer women redemption and access to heaven through suffering motherhood, suppression of all negative emotions, and complete disembodiment of sexuality.

Commentary

From a psychological standpoint, the patriarchal disparagement of the feminine figure in all of her complexity reveals a deep-seated male fear of the mysterious and uncertain aspects of female sexuality and personality. The archetype of the “evil anima” as well as the subdued “Mater Dolorosa” (suffering mother) reflects the disturbed

relationship between man and woman. This alienation and hatred is explained in part by the historical suppression of the pagan goddess through monotheism as well as by the cultural subjection of women through the establishment of patriarchy. The evil anima archetype is an expression of man’s fear of the feminine revenge, a fear that may be rightly justified, while the altruistic, asexual mother poses as the benign ideal of femininity that provides for the emotional needs of men but has no life of her own and as such poses no threat to the established patriarchal order.

For contemporary women, the psychological implications of the culturally inherited constructions of femininity have led to the dilemma between their desire for societal competence and their fulfillment of the feminine roles expected of them in their personal lives but devalued in society. Those who attempt to juggle the demands of both competence and sex-role identity are met with the burdens of physical and psychological burnout that accompany the efforts to embody the colloquial “superwoman.” Feminists have argued that women need a redefinition of femininity (some have proposed a plurality of meanings, of “femininities” and “sexualities,” rather than any one universal definition) as well as of cultural expectancies for competence which will necessarily have ramifications for definitions of masculinity and societal expectations of male competence. Finally, since cultural concept of God has been shown to form the underlying connection between patriarchal religion and a society of violence, many have argued that no social, scientific, or ecological paradigm shift can take place unless the theological shift occurs which moves away from exclusively patriarchal images of God and includes the feminine aspects of the divine.

Fluid Sexuality

Amitabh Vikram Dwivedi
College of Humanities and Social Sciences –
Languages and Literature, Shri Mata Vaishno
Devi University, Katra, India

Introduction

The term “fluid sexuality/sexual fluidity” has many denotations, such as sexuality is not fixed but unstable; sexuality is not innate but a matter of choice; sexuality doesn’t exist and there are only preferences (Sexuality is Fluid 2015); and so on and so forth. The contemporary psychologists and religious gurus provide explanations to sexual fluidity, and they emphasize that it is not only fluid but also a complex field (Sexuality n.d.). The Hindu philosophy has a concept *Tritiya Prakriti* “third nature” (also the term employed for “third sex” and “third gender”), which includes people with different sexual orientations, including transgenders, transsexuals, masculine females, effeminate males, androgynes, intersexed, gays, lesbians, bisexuals, and alike. The *Tritiya Prakriti* can roughly be translated as pansexual in English. To understand sexual fluidity, psychiatrists have devised sexual orientation grids, which divide sexual orientation into different categories (Sexuality n.d.). This chapter will provide psychological explanation

juxtaposing religious references to fluid sexuality in detail.

Discussion

The Hindu religious literature is full of narratives of gods and goddesses where changing their biological gender occurs. The androgynous form of Shiva and Parvati, aka *Ardhanarisvara*, which represents “that the masculine and the feminine are equally divided within yourself” (Ardhanarishvara 2018). Also, the half-man and half-woman form of *Ardhanarisvara* represents creation and fertility symbolically. Shiva is the *Purusha* “source of creation” and Parvati is *Prakriti* “nature.” When masculinity and femininity fit perfectly well, creation happened (Ardhanarishvara 2018). The homosexual and transgender communities in India worship the *Ardhanarisvara* form of Lord Shiva. Also, there are other Hindu deities which are connected to sexual fluidity, such as *Aravan* with whom Lord Krishna married after changing gender; *Harihara* is a combination of Lord Shiva and Lord Vishnu; *Bahuchara Mata* is worshipped by eunuchs and transgenders; Yellamma and Gangamma are connected with disguises and cross-dressing. Gender diversity is also displayed in the *Mohini* avatar of Lord Vishnu, and *Vaikuntha Kamalaja* represents the androgynous form of Lakshmi and Vishnu.

Psychologists believe that sexuality is influenced by genetic and social factors. Klein created a sexual orientation grid, which categorizes orientation into seven different types, namely, attraction, behavior, fantasies, emotional preference, social preference, lifestyle, and self-identification. This grid helps people with gender diversity to find out why they are and what they are without falling prey to labeling themselves in LGBTQ. So, there is a possibility that a man is sexually attracted to men but is emotionally attached to women. Or a woman enjoys the company of women sexually but fantasizes about men and so on (Sexuality n.d.). Also, Aaron argues why “the most popular forms of porn for

heterosexual men is ‘T-porn,’ or porn featuring pre-op trans women” (Sexuality n.d.). Further, he explains that heterosexual males get arousal by thinking of a woman with a penis. So, there is a possibility that some men or women who engage with same sex or who experiment themselves with gender diversity is due to the fact that they have some fetish appeal than an orientation (Sexuality n.d.).

Historically speaking, fluid sexuality was never unnatural in India (Babur to Dara Shukoh 2018). The Mughal era is full of such references. Babur wrote about a love for a boy openly in his memoirs. Jahanara Begum was in love with a slave girl and also being accused of incestuous relationship with her father. Mehmed, the Ottoman ruler, had sexual fluidity, and he desired young men (Babur to Dara Shukoh 2018).

Folk Magic

David Waldron

Department of Social Science and the Humanities,
University of Ballarat, Ballarat, VIC, Australia

Common to most, if not all preindustrial cultures, is a vibrant tradition of folk magic and ritual tradition closely linked to established mythology, folklore, and archetypal associations. These traditions vary enormously and are closely linked to a variety of social, historical, cultural, political, and economic factors. The many and complex networked structures of belief, ritual, and mythology that coalesce in magical traditions have long been studied and documented by anthropologists and folklorists.

From an analytical psychological perspective, one of the key ingredients of folk magical practices and rituals is that they serve as *prima facie* expressions of emotion. Malinowski, in his analysis of folk magic in Melanesia, argues that magical ritual is invariably constructed in patterns that evoke emotion and resonate symbolically within a culture. In this sense, emotion, and thus psychology, is at the heart of magical ritual (Malinowski 1948). The ritual serves as a symbolic representation of the desired ends, and the emotions that led to it are rendered symbolically through powerful and pervasive archetypes in that culture and thus directly relate to the social, cultural, and political issues that led to the rituals perceived necessity. Subsequently, each type and form of folk magic is derived from its own network of social formations and cultural forms and is fundamentally integrated with localized politics, social structures, conflicts, and economic uncertainties. This localized experience also serves to distinguish folk magic from ceremonial magic in that it is not born of an attempt to create abstract structures granting access to divine power, in a philosophical manner, but is an organic socially derived network of practices and beliefs relating to deeply felt anxieties (Jung 1964).

However, while there are a vast array of bewildering forms, rituals, and beliefs surrounding folk magic practices, it is generally accepted that there are certain universal features and commonalities between varying magical traditions. One key issue identified by Frazer is that folk magic practices are often *sympathetic* in nature. That is to say, the items and rituals used in magic typically either symbolically resemble the target of the magical practice (*law of similarity*) or have come into contact with them and become ritually polluted with their essence (*law of contagion*) (Frazer 1922). From a Jungian perspective, these forms also relate closely to symbolic archetypes, whereby the symbols, the target of the magic, and its ritual practice are linked through archetypal association in the collective unconscious. Subsequently, these magical rituals also serve as a means to grapple with complex psychological issues and serve as an avenue into the unconscious (Jung 1938).

In this sense, folk magic is both derived from the heritage of past traditions and mythology and is also a living tradition which creates its own body of myth and folklore. Thus, folk magic is an intrinsically organic construct that both shapes and constructs its own mythology and folklore, yet is profoundly influenced and shaped by its contextual mythological base, politics, and culture. Consequently, the rituals, symbols, and cultural artifacts of folk magic serve as a powerful avenue into the complex interconnections of the conscious and unconscious aspects of the psyche as manifested in lived experience within the social, cultural, and physical worlds.

Every major religion endorses forgiveness as a virtue. The religious perspectives have brought forth numerous practical and theoretical understandings of forgiveness for centuries. In the last 20 years, the field of psychology has pursued the scientific study of forgiveness. Can this study add to what millennia of religious thought and practice has taught humankind?

Science as a New Tool

Peter Galison (2003) has put forth an understanding of scientific revolutions in understanding, which attributes the seeds of change to the development of new tools. The invention of the telescope paved the way for observing phenomena that were not observable in Newtonian physics. The new data eventually created problems for the old paradigm. According to Galison, a revolution in a scientific field is due more to applying new tools to a phenomenon than simply to providing a re-conceptualization of the phenomenon.

The scientific study of forgiveness has brought a new tool to its study and practice – the method of

careful, analytical science. Science forces us to define variables precisely and then subject the understanding of relationships among variables to empirical testing. Whereas theology and philosophy are likewise careful at defining concepts and test their definitions against logical criteria, authoritative texts, and teachings, science relies on a different source of authority – empirical observation.

Basic Definitions

The results of the scientific study of forgiveness have been astounding. In 20 years, there has been a ten-fold increase in scientific interest, from 529 citations in PsycINFO for *forgiv** on December 31, 1997, to 5337 on October 24, 2017. Our understanding of forgiveness has become more precise as science has focused on it, and perhaps the most well-supported theory of forgiveness is the stress-and-coping theory (Strelan and Covic 2006; Worthington 2006). Transgressions (i.e., violations of psychological or physical boundaries) are stressors. They are appraised as to the threat of harm and to the amount of injustice inflicted – called the injustice gap (see Davis et al. 2016). The injustice gap is the difference between the way a person would like to see a transgression resolved (i.e., “I’d like to see her come crawling on her knees begging my forgiveness”) relative to the way the situation is perceived to be currently (i.e., “She’s so cold. She seems to have no remorse at all, and I’m afraid she’ll betray me again”). Bigger injustice gaps are harder for the person to resolve and are related to higher stress reactions, of which more unforgiveness is key to the person’s reaction. Unforgiveness is a complex combination of negative emotions, like resentment, bitterness, hostility, hatred, anger, and fear, rolled into an emotional experience interpreted by a person’s working memory as feeling unforgiving.

A person can reduce the injustice gap (and hence reduce unforgiveness) in many ways that do not include forgiveness. The person might inflict vengeance (i.e., a kind of vigilante justice), see justice done societally, observe a person

getting her just desserts, or see an authority like the courts administer justice. Or the person may reduce the injustice gap through passive acceptance. For example, the person might also simply accept that “stuff happens” and moves on with his or her life. The person might forbear, suppressing negative emotions, or turn the matter over to Divine justice or simply relinquish the matter into God’s hands.

Forgiveness is one way of reducing the injustice gap and unforgiveness (Worthington and Scherer 2004). Forgiveness involves internal changes that recognize the offense but choose not to hold it against the offender and (perhaps) to seek more positive feelings and motivations toward the offender. There may be related interpersonal experiences around forgiveness, such as the offender asking for forgiveness, the victim communicating forgiveness to the offender, or either party telling others of the forgiveness. Thus, the context of transgressions is intrapersonal, but forgiveness is intrapersonal. Forgiveness is often confused with reconciliation, but forgiveness occurs within the skin of a person, while reconciliation is the restoration of trust between two people, through trustworthy behavior by the parties.

Forgiveness is of two types (Exline et al. 2003). *Decisional forgiveness* involves making a decision to change behavior intentions from negative to positive. It is not motivation, for the person can be motivated for revenge but still adhere to behavioral intentions to treat the person positively. Likewise, decisional forgiveness is not actual behavior, for a person could forgive a dead parent, but no longer has the option to act directly with benevolence or conciliation toward the parent. *Emotional forgiveness* involves the experience of replacing negative unforgiving emotions with positive other-oriented emotions toward the offender. The replacement emotions most commonly discussed among forgiveness researchers are empathy, sympathy, compassion, and love. The replacement emotions begin by neutralizing unforgiveness, gradually reducing it. Usually, that is where people stop trying to forgive – especially in unilateral forgiveness, which is forgiveness where the transgressor is either dead or no

relationship continues. However, when a relationship is expected to be ongoing (i.e., interpersonal context), then people often continue to seek to experience more positive emotions in the relationship in order to make it “stronger in the broken places.” Decisional and emotional forgiveness may occur independently, but generally they affect each other. Thus, it is possible to forgive decisionally but not experience full emotional forgiveness and to forgive emotionally but never to have made a conscious decision to forgive. However, usually the two are psychologically linked.

Full forgiveness is usually better talked about as full decisional forgiveness, which usually occurs at a moment of decision. The person might ponder whether to make a decision to forgive for minutes or years, but usually the decision is dichotomous, like switching on a light. Or a person might experience full emotional forgiveness, which might involve merely getting to a place of neutral feeling toward the offender (in unilateral emotional forgiveness) or getting to a net positive experience toward the offender (often in interpersonal forgiveness). In contrast to decisional forgiveness, emotional forgiveness happens piecemeal, or more herky-jerky, as emotions are gradually replaced and influenced by the ebb and flow of any ongoing interactions with the offender. There is a time course within which most emotional forgiveness occurs. Usually, much forgiveness occurs early after a person begins to try to forgive, and then the rate of emotional forgiveness tapers off.

Self-Forgiveness

When concepts of forgiveness are applied to the self, self-forgiveness often does not parallel forgiveness of others (for summaries, see Woodyatt et al. 2017). When one transgresses and experiences shame, guilt, and self-condemnation, typically, one sees oneself more as an offender than as a victim (Fisher and Exline 2006). Namely, before dealing with self-condemnation, people should seek to make things right with the Sacred (as one understands the Sacred). Then, one needs to try to

make restitution with those harmed. Then, the person might forgive himself or herself for the wrongdoing (Hall and Fincham 2005, 2008; Woodyatt and Wenzel 2013). However, forgiveness might still not take care of the self-condemnation because self-condemnation might be due more to a failure to accept oneself as a flawed person than to guilt for a specific wrongdoing. For example, if a person steals money from the coffee room at work, the person might confess the crime to God, make restoration to the coffee fund, and forgive the self. However, even though self-forgiveness is complete, the person might still be self-condemning because before committing the theft, the person was not a thief. Now, the person is. Accepting a new self-definition might lead to self-condemnation even though the person has forgiven himself or herself for the actual theft. Psychotherapeutic (Cornish and Wade 2015) and do-it-yourself workbook interventions (Griffin et al. 2015) have been developed to promote self-forgiveness.

Religions and Forgiveness

The various religions treat forgiving differently (Rye et al. 2000). These cultural differences affect how forgiveness is understood and practiced.

In Judaism, forgiveness is usually seen within the context of *tseuvah*, or repentance of the offender. If an offender demonstrates true repentance – usually undergoing a series of demonstrations of sincerity of change and return to the path of God – then a victim is obligated to forgive. One tenet of Judaism is that victims must grant forgiveness, and forgiveness cannot be granted on behalf of the victim. Thus, logically, one who has murdered will never obtain forgiveness from the victim.

In Christianity, forgiveness is the centerpiece of the religion. Jesus’ crucifixion is said to have paid the full demands of justice for any person’s injustices against God, and God compassionately and lovingly forgives any person who accepts that forgiveness. This is usually termed as Divine forgiveness, and it refers to the adoption of a person as a child of God. Jesus tied Divine forgiveness of

individual sins to a person's forgiveness – probably what we now think of as decisional forgiveness – of the transgressions experienced at the hands of others. In Christianity, God requires decisional forgiveness and desires emotional forgiveness.

In Islam, God is seen as the all-forgiving God, and forgiveness figures prominently in the Qu'ran. However, generally justice is seen as one's due, and forgiveness is seen as virtuous. It is reward-worthy if one wishes to forgive instead of exacting the justice that is one's due from a transgression.

In Buddhism, there is no explicit word for the concept of forgiveness in original Buddhist texts. Nevertheless, the notion of forgiveness is inherent in compassionate responses to wrongdoing or mindful responses to wrongdoing. Forgiveness is also a concept that is employed in order to help promote loving-kindness during meditation.

In Hinduism, forgiveness is valued. While there are a variety of understandings of forgiveness, it is generally seen as in line with dharma, the path of right living. It is often associated as a means to drive away sin and transgression.

Thus far, we have focused mostly on forgiveness within the bounds of organized religions, briefly alluding to the largest religions. Many people, however, consider themselves as spiritual and not religious. Spirituality can be rooted in an elevated view of humanity or attunement with nature. Thus, transgressions against oneself or perpetrated by oneself can disrupt the person's sense of harmony. This disrupted sense of harmony can motivate a drive for forgiveness or seeking forgiveness to restore a sense of positive spirituality.

Whereas religion is a body of beliefs, values, and practices endorsed by a particular community, spirituality is the personal sense of closeness or connection with the Sacred (Zinnbauer et al. 1997). Davis et al. (2013b) meta-analyzed the empirical research on forgiveness and religion/spirituality. They found religion to be more related to forgiveness of others, but spirituality to be more related to forgiveness of oneself.

A curious finding has been uncovered in the relationship of religion and forgiveness. People who are more religious, as a group, report themselves to be more forgiving than do people who do not endorse religion. However, when asked to recall a transgression, they often are not much better at granting decisional forgiveness or experiencing emotional forgiveness than are people who do not endorse religion. There are methodological reasons that such a finding occurs. Generally, people are asked to recall a hurt and they most easily recall one that is still an open transgression. It has been shown, however, that if people are asked to recall several hurts and the amount of forgiveness is aggregated over the variety of hurts, then the more religious a person is, the more likely he or she is to forgive individual hurts deeply and quickly.

Promotion of Forgiveness

Applied psychological science has shown that people who struggle to forgive can be helped to forgive faster and more deeply by participating in individual forgiveness therapy, couple therapy to promote forgiveness, or psychoeducational groups to promote forgiveness (for a meta-analysis, see Wade et al. 2014). Most interventions have been aimed at experiencing empathy and greater understanding of the offender's perspective. The more deeply empathy is experienced, the more deeply emotional forgiveness is experienced. Effortful thinking about forgiveness is generally needed to forgive, which puts some due stress on the self. In examining almost 60 groups that sought to promote forgiveness, there was a strong dose-response relationship between the mere amount of time trying to forgive and the amount of emotional forgiveness a person actually felt. In addition to promoting forgiveness, the same dose-response relationship was found in lowering depression and anxiety and increasing hope when people attended forgiveness treatments.

Forgiveness is truly a concept that now can be claimed by both religions and psychology. The tool of psychological science has provided more

nuanced understandings of forgiveness than was available a quarter of a century ago.

Forgiveness and Religious Tradition

Etienne Mullet¹ and Félix Neto²

¹Ethics and Work Laboratory, Institute of Advanced Studies, Paris, France

²Universidade do Porto, Porto, Portugal

Introduction

Forgiveness has been defined as the “forswearing of negative affect and judgment by viewing the wrongdoer with compassion and love, in the face of a wrongdoer’s considerable injustice” (Enright et al. 1991, p. 123). Forgiveness has been defined as “the disposition to abort one’s anger (or altogether to miss getting angry) at persons one takes to have wronged one culpably, by seeing them in the benevolent terms provided by reasons characteristic of forgiving” (Roberts 1995, p. 290). Forgiveness is thus an overall disposition that manifests itself in most circumstances in life. Forgiveness, by contrast, only applies to particular circumstances (particular offenses).

By religious tradition, we have essentially considered Buddhism, Christianity, Hinduism, and Islam, without distinguishing between variants of these traditions (for a review, see McCullough et al. 2005). These are only a limited set of studies that have examined, separately from the effect of culture, the effect of religious tradition on forgiveness. These studies have been conducted in specific areas such as Lebanon or Macau where the two effects can, to some extent, be disentangled. We essentially focused on these studies.

Islam Versus Christianity

Willingness to Forgive

Azar and Mullet (2001), using a technique of realistic vignettes, examined willingness to forgive under different circumstances in Muslim and Christian adults living in Lebanon and

sharing the same Arab culture. An example of vignette used with the Muslim sample is the following: “During the civil war, a child from the Hamed family was seriously wounded by a bullet. The family knows the identity of the gunman: His name is Daniel (religious dissimilarity information). He fired deliberately at the child (intention information). Today, the child has completely recovered (cancellation of consequences information). The gunman has come to ask for forgiveness for his act (apologies information). If you were a member of the Hamed family, to what degree would you be disposed to forgive him?”

Overall, Muslims and Christians were, to the same extent, willing to forgive, and this finding was not the result of lack of statistical power because educational level had, by contrast, a strong effect: The better the participants were educated, the more they were willing to forgive. In addition, the positive effect of cancellation of consequences and the negative effect of intent to harm had, in both groups, a similar impact on willingness to forgive. The effect of apologies was stronger among Muslims than among Christians. Finally, participants considered that religious similarity/dissimilarity with the offender was irrelevant at the time of forgiving. Similar findings were reported by Vinsonneau and Mullet (2001) in a study conducted among young Muslims and Christians living in France and by Ahmed et al. (2007) in a study conducted among young Kuwaiti.

Dispositional Forgiveness

Mullet and Azar (2009), examined, through confirmatory factor analyses, the extent to which the three-factor structure of forgiveness found by Mullet et al. (2003) on various samples of Europeans from Christian background fits the data obtained on samples of Lebanese Muslims and Lebanese Christians. The structure tested was (a) lasting resentment, which expresses the victim’s tendency to hold negative emotions, negative cognitions, and exhibiting avoidance behaviors toward the offender, even in the presence of positive circumstances (e.g., I keep being resentful even if the offender has apologized);

(b) sensitivity to circumstances, which expresses the victim's ability to analyze the pros and cons of harmful situations and to build on the many circumstances of these situations for deciding whether to forgive or not to forgive the offender (e.g., I feel it easier to forgive once the consequences of the harm have been canceled), and (c) unconditional forgiveness, which expresses the victim's tendency to harbor positive attitudes toward the offender even in the absence of positive circumstances (e.g., I can easily forgive even when the consequences of the harm were serious).

Regarding the Lebanese Christians, the fit was acceptable, whereas regarding the Lebanese Muslims, it was not good. Nevertheless, a slightly different three-factor structure in which a special status was given to repentance and apologies fit the Muslim data. In this alternative model, the meaning of sensitivity to circumstances was reduced to circumstances that did not imply the offender's behavior or the victim's mood, and the meaning of lasting resentment was that the presence of apologizing behavior from the offender was a necessary condition for the resentment to weaken, for the mood to improve, and for a first step toward forgiveness to be taken. In addition, the Lebanese Muslims' unconditional forgiveness score was significantly lower than the corresponding Lebanese Christians' score.

Dispositional Seeking of Forgiveness

Neto et al. (2013) examined the extent to which the three-factor structure of dispositional seeking of forgiveness that was found by Chiamello et al. (2008) in various samples of Europeans from Christian background fits the data obtained on a sample of Muslim students living in Indonesia. The structure tested was (a) inability in seeking forgiveness, (b) sensitivity to circumstances before seeking or not seeking forgiveness, and (c) unconditional seeking of forgiveness. The fit was good. The sensitivity to circumstances score was higher among Muslims than among other groups. However, as in this study, religious tradition and country were confounded this difference may also reflect an effect of culture. Similar findings were observed in a study by Bugay

et al. (2013) on a sample of Muslim Turkish students.

Conceptualizations of Forgiveness

Bugay et al. (2013) assessed the extent to which the four-factor structure of conceptualization of forgiveness found by Mullet et al. 2004 on a sample of participants from Christian background fits the data obtained on a sample of Muslim Turkish students. The four conceptualization factors were (a) forgiveness as change of heart, (b) forgiveness as a broad process that is not limited to the victim-offender dyad, (c) forgiveness encourages repentance, and (d) forgiveness is an immoral behavior. The fit was good. Overall, participants from Turkey tended to agree with the ideas that forgiveness encourages repentance and that forgiveness is a broad, more-than-dyadic process, significantly more than participants in the study by Mullet et al. (2004). As in the previous section, this difference may also reflect an effect of culture.

Reasons to Forgive

Ballester et al. (2011) assessed the extent to which the five-factor structure of motives to forgive that was found in a sample of Western European adults fits the data from a sample of Muslim adults living in Morocco. These motive factors were called (a) forgiveness through the restoration of sympathy, (b) forgiveness as challenge, (c) forgiveness as the recovering of mastery, (d) forgiveness through morality, and (e) forgiveness through love. The fit was good. Moroccans essentially differed from Western Europeans regarding the importance attributed to morality (e.g., one of the reasons why I have forgiven in the past was that my religion or my philosophy of life commanded it), and the importance attributed to the restoration of sympathy (because the offender had sincerely begged for forgiveness).

Importance of Apologies and Contrition Among Muslims

This set of findings is consistent with the view that even if most faiths encourage forgiveness, the exact circumstances under which forgiveness

must be granted vary from one religious tradition to the other. In the Muslim tradition, as opposed to the Christian tradition, forgiveness must not be unconditional (Moucarry 2004). The Muslim community is conceived as a political entity as well as a religious community. In a tradition that is aimed at governing daily social life, elevating forgiveness to the level of a categorical imperative would be unworkable. Human natural reluctance to forgive as well as interpersonal and social justice considerations has to be taken into account. In particular, for forgiveness to be granted, the offender is strongly expected to demonstrate repentance and contrition and explicitly, sometimes repeatedly, to beg for forgiveness from his or her victim. In contrast with the Muslim community, the Christian community is conceived as a religious community only. In such an ideal community, forgiveness can, without much resistance, be erected as a moral imperative (Rye et al. 2000). As a result of these theological differences, apologies and contrition may be attributed different statuses. Among Christians, apologies and contrition may be considered as mere circumstances of the offense in the same way as harm's intent and offense's severity. Among Muslims, apologies and contrition may be attributed a specific status, and apologies and contrition may be held as a basic requirement for forgiveness to be considered as an option among other possible behaviors.

Hinduism Versus Christianity

Dispositional Forgiveness

Tripathi and Mullet (2010) have examined the extent to which the three-factor structure of forgivingness fit data obtained on a sample of Hindu students living in Chandigarh. The fit was good. The Hindu showed themselves rather sensitive to circumstances and moderately prone to forgive but also moderately prone to resent. The finding was consistent with findings by Suchday, Friedberg, and Almeida (2006) who have found high-alpha values for their measures of forgiveness and rumination on a sample of Indians.

Conceptualizations of Forgiveness

Tripathy et al. (2010) have also assessed the extent to which the four-factor structure of conceptualization of forgiveness fits the data obtained on their sample. The fit was good. Overall, Hindu agreed with the view that forgiveness encourages the offender's repentance, moderately agreed with the view that forgiveness is a broad process possibly also encompassing third parties, tended to slightly disagree with the view that forgiveness corresponds to a "change of heart" and disagreed with the view that it is an immoral behavior.

The relationships between Hindus' conceptualizations about forgiveness and Hindus' forgivingness were highly similar to the ones that had been found among Europeans. Change of heart and broad process were positively associated with unconditional forgiveness, and immoral behavior was positively associated with lasting resentment. These associations were found beyond the well-documented association between forgivingness and personality factors that was also present in the Hindu sample.

Forgiveness and Karma

These findings were consistent with Hindu views regarding forgiveness. In the Hindu tradition, forgiveness has always been considered as a great virtue. The word most commonly used to signify forgiveness is *Ksama*, which means compassion or mercy. As central tenet of Hindu spirituality, forgiveness has been defined as mental strength in the face of offenses; it implies lack of emotional upset or impassivity and tolerance under difficult circumstances (Kodandaramayya 2004). Lack of forgiveness, negative feelings, and unresolved anger can be expected to spill over into future births, as, through karma (law of cause and effect), individuals face consequences of their actions in subsequent reincarnations. Mahatma Gandhi, Indian political and spiritual leader, declared forgiveness as a great virtue and stated that the weak can never forgive because forgiveness is the attribute of the strong.

Buddhism Versus Christianity

Paz et al. (2007) examined the extent to which the three-factor structure of the forgivingness questionnaire mentioned above fits data obtained on samples of Buddhist Chinese, Christian Chinese, and Buddhist-Christian Chinese living in Macau. They found that, in all three samples, the model fits the data. The Buddhists were found to be significantly more resentful and less forgiving than the Christians whereas the responses of the Buddhist-Christian were closer to the Buddhists' responses for lasting resentment and to the Christians' responses for willingness to forgive.

The good fit of the three-factor structure in a Buddhist sample was consistent with their views regarding what Westerners call forgiveness. In Buddhism, the renouncing of anger and resentment toward the offender (possibly corresponding to the lasting resentment factor) and the removal of an expectation of retribution (possibly corresponding to the unconditional forgiveness factor) are considered as distinct virtues (separate factors). In addition, in China, being able to take into account the opinion of others and the social circumstances of every event and being able to conform to social duties are crucial qualities inherited from Confucianism, hence, the emergence and the high value of the sensitivity to circumstances factor.

Overall, the whole set of comparative findings supports the view that “despite religious, cultural, and linguistic differences, there is universality to certain concepts such as forgiveness” (Suchday et al. 2006, p. 87).

Forgiveness and the Brain

James G. Emerson
San Francisco, CA, USA

The decade of the brain in the United States, 1990–2000, unleashed remarkable work on the dynamic of brain activity. It has remained for those in England to focus on the implications of brain studies for the dynamic of forgiveness. A major center for this work is the Sheffield Medical Center in Sheffield, England. Key names in this work are those of Thomas Farrow, Ph.D., and Peter Woodruff, Ph.D.

The development of brain studies moves at a pace that one can hardly keep up with it. Although one could reference books, the Internet appears to be the best resource for keeping in touch with the discussion.

Common to all these studies is first the discovery that the act of forgiving involves certain areas of the cerebral cortex – mostly in the left side of the brain. In what might be called the “executive” section of the brain, there is action that deals with feelings and dynamic activity in all of the brain – including healthy brains or brains afflicted with problems such as schizophrenia. The particular area where there appears to be the most activity when forgiveness becomes active is the left superior frontal gyrus, the orbitofrontal gyrus, and the precuneus.

Also common to all these studies is the discovery that the dynamic of forgiveness leads to certain degrees of health or improvement.

Across the world spectrum of religious or theological writings on the area of the brain and forgiveness, case after case has developed of the positive effect of the teachings of Jesus and Paul.

From a theological standpoint, two cautions, however, need to be noted in relation to these studies: the first is the fact that Paul seldom uses the word “forgiveness” and more often speaks of “freedom in Christ.” The second is that there are cultures in African and south Asian parts of the world that do not have the word “forgiveness.” Therefore, when talking about the experience of forgiveness, as Feldman of the University of California has observed about all neurological discussion, precision is required. For the purpose of discussion, this entry recommends the view of Dr. Farrow that we follow the definition of the Oxford Dictionary: “Forgiveness is ceasing to feel angry or resentful to another.” To this we also do well to add, “forgiveness of self means a ceasing of being angry with oneself.”

Today, some of the most profound work in relating brain studies and religious practice is that guided by the current Dalai Lama. In that work, guilt and forgiveness get little if any mention. Yet considerable attention is given to meditation and processes that contribute to our understanding of the use of forgiveness in such matters as forgiving oneself and accepting the forgiveness of others – including God.

Fox, Matthew

Richard Townsend
College of St. Scholastica, Duluth, MN, USA

Matthew Fox (b.1940) is a preeminent creative American spiritual theologian who cuts a bold swath through thickets of rigid religious opposition to create “Creation Spirituality.” He is a leader and shaker in awakening Christianity to a renewed ecumenical spirituality that puts human beings in touch with their deepest cosmic souls, free of stifling religious traditions, patriarchal domination, and mechanistic industrialism and open to the wonders of creation. He was influenced by Leo Tolstoy, Thomas Merton, Teilhard de Chardin, and others; he studied at the Dominican Aquinas Institute of Theology, then the *Institut Catholique de Paris* (1967–1970) (Fox 1996).

To Fox, the mystics resonate with his own insights. In Thomas Aquinas, Fox found support for his creation-centered theology. In Meister Eckhart and Teilhard de Chardin, Fox found a mystical connection with nature and science. In Hildegard of Bingen, Fox found feminism, music, art, healing, ecological spirituality, and

courage to stand up to oppressive church authorities.

Fox was drawn to the writings of the post-Freudian psychologist Otto Rank. In Rank he found a profound connection between art, creativity, and spirituality. As Rank explored the intimate relationship between human creativity and psychological wholeness and well-being, he articulated a deep and powerful spirituality that Fox uncovered (Fox 1995).

With the help of Meister Eckhart (Fox 2000b), Fox developed a framework for an articulation of Creation Spirituality in *four paths*, elaborated in *Original Blessing* (Fox 1983/2000):

- (a) The *Via Positiva* is the path of awe, wonder, joy, and praise. This path celebrates the beauty and sensual delights of creation, nature, food, dance, and sexuality. In this experience and celebration of creation through our human senses, we experience ecstasy and the divine.
- (b) The *Via Negativa* is the path of letting go and emptying, of silence and of darkness, suffering, despair, and grief. The *Negativa* includes silence, the peace in meditation, stargazing, the dark womb before birth, and the soil where seeds sprout.
- (c) The gestation period of the *Via Negativa* gives birth to the *Via Creativa*, the path of creativity. In their creativity, humans are closest to God/Goddess and most in touch with their own divinity. God is divinely creative, humans are creative, and the Universe is creative. When humans forget or deny their divine nature, they become destructive (see Rank on the *artiste manque*).
- (d) The *Via Transformativa* is the path of justice, compassion, and coming home. The *Transformativa* fosters community and calls us to action in creating environmental, economic, and social justice. The *Transformativa* is where we express the prophetic “No” to injustice that defends our mystical “Yes” to peace, compassion, and justice.

Matthew Fox is known for his theology of *Original Blessing* (Fox 1983/2000), a direct

counter and biblical alternative to Augustine's doctrine of original sin. He criticizes the flawed doctrine of original sin as a means to keep church members in line, shamed, guilt ridden, and afraid by making the Church into the indispensable dispenser of grace.

Fox sees the relationship between science, religion, and Creation Spirituality a creative path for knowing nature and ourselves fully and embracing the interconnectedness of all that is, including cosmic spirituality. He sees in the scientific story of evolution our own postmodern creation story, The New Cosmology, and has worked with scientists Thomas Berry, Brian Swimme, and Rupert Sheldrake (Fox and Sheldrake 1996).

Fox has brought fresh vision with new language such as:

- Deep ecumenism – All the religions of the world, as well as art, science, and all manners of creativity, are born of our common experiences as human beings on the planet Earth. World religions do not need to be *bridged* as much as simply returned to the common source of our origins, as explained in the deeply ecumenical *One River, Many Wells: Wisdom Springing from Global Faiths* (Fox 2000a).
- Reinventing work – In *The Reinvention of Work: A New Vision of Livelihood for Our Time* (1993), Fox invites us to find work that is not simply industrial cog-in-the-machine “jobs,” but meaningful work big enough for our souls, our Great Work. Those doing good work in the world constitute a “priesthood of all workers.”
- Reinventing education – Education cannot be narrowed down to the “mind.” If the body is sacred, education must include the body and touch all the chakras. *Body prayer*, which includes dancing, drumming, Tai Chi, Yoga, chant, song, prayer, is playful meditation and celebrates the body while stimulating both sides of the brain, facilitating full engagement of academic material. Fox founded the Institute for Culture and Creation Spirituality (ICCS) at Chicago's Mundelein College in 1976. In 1983, he moved ICCS to Holy Names College in Oakland, California. In 1996, he founded the University of Creation Spirituality in Oakland that includes Masters and Doctor of Ministry programs. Fox's current educational project is YELL AWE (Youth and Elders Learning Laboratory for Ancestral Wisdom Education), a program for inner city youth where kids learn about meditation, martial arts, and creativity. See *The A.W.E Project: Reinventing Education, Reinventing the Human* (Fox 2006a).
- Art as meditation – Art requires focus that all meditation does. Thus, Art as Meditation can give access to deeper levels of creativity for doing study and work in the world, whether it is in theology, mathematics, and science, fighting injustice, or peacemaking and community building. *Creativity: Where the Divine and Human Meet* (Fox 2002) develops this theology of spirituality and art.
- Feminist theology/feminine images of God – Fox spent much of his time as a Catholic priest answering to authorities for his bold use of feminist images of the divine, primarily God as Mother. His use of “Kingdom/Queendom of God” in *Original Blessing: A Primer in Creation Spirituality* was an example of Fox's constant attention to gender-inclusive language and balanced images of the divine.
- Men's spirituality – As each wave of the feminist movement serves to reorient the world to what it means to be female and feminine and empower women anew after centuries of destructive patriarchy, men must reinvent themselves also. This requires exploring new, postmodern mythologies of manhood/masculinity. Fox does this in *The Hidden Spirituality of Men: Ten Metaphors to Awaken the Sacred Masculine* (2008).
- Reinventing worship – Fox has taken issue with what he deems boring worship and ritual by rote. To counter the failings of ritual to keep up with the needs of modern/postmodern communities, Fox created the Techno Cosmic Mass (TCM), combining worship with rave-style dance and a multimedia visual experience.

Later called simply the Cosmic Mass or Cosmic Celebration, this exciting, dynamic, and constantly evolving form of ritual includes projected imagery representing the theme of the Mass which has as a structure of the *four paths* of Creation Spirituality; intense “techno” dance music associated with rave culture; and representation of various religious traditions, music and drumming, rap, poetry, and grieving together. For many participants, the Cosmic Mass was their first experience of feeling a deep spiritual connection with any form of religious ritual or celebration. (<http://www.thecosmicmass.com>)

- Ecology and Cosmology – Fox’s Creation Spirituality is necessarily protective of the planet, because it is about resacralizing our relationship with nature and recognizing how it is through this relationship that we experience the divine. The New Cosmology – the 13.7-billion-year Universe story as told by science – provides a cosmic context from which humankind is invited to be as creative as the great universal mystery, a passionate panentheism, that gave birth to us. Cosmology, ecology, and theology/spirituality are intimately related in *The Coming of the Cosmic Christ* (Fox 1988).

Fox’s most profound theological contribution is overcoming the stale subject/object dualisms and naming of the interconnectedness of humankind with all of life on the planet and with the great divine mystery of the entire Universe. In Fox’s case, once we have seen, named, and experienced the intimate relationships between what were previously considered separate categories, such as gender, science, cosmology, religion, art, and spirituality, we come to understand them as a complex, interrelated ecosystem. The disciplines are not separate pieces bridged by long-winded philosophical arguments; rather they are elements of a healthy, balanced spirit-body ecosystem that cannot be separated without causing harm to the whole.

Fox has endured much criticism for his activism in the world. Cardinal Ratzinger silenced Father Matthew Fox in 1989 for a year from

teaching or writing because of Fox’s teaching on God as Mother. Fox saw this year as a welcome sabbatical and visited liberation theologians in Latin America who were similarly silenced. After 1 year, Fox published prolifically and began his popular lectures saying: “As I was saying 14 months ago when I was so rudely interrupted. . .” The standing ovations that Fox so often inspires in his audiences are testaments to the hunger for his message of spiritual activism and the mission to return deep communal and individual spirituality to religious life. In 1993, Fox was dismissed from his Catholic Dominican order. Fox came to see that “the Vatican had made me a *postdenominational priest in a post-denominational era*” (Fox 1996, p. 246). In 1994, Fox was welcomed into the Episcopal priesthood at Grace Cathedral in San Francisco (Fox 1996, p. 250). In 2005, Fox and friends went to Wittenberg, Germany, where Martin Luther nailed his inflammatory 95 Theses to the door of the Castle Church calling for a New Reformation, including No. 11: “Religion is not necessary, but spirituality is” (Fox 2006b, p. 65). He continues his challenge to the Roman Catholic Church, as in *The Pope’s War: Why Ratzinger’s Secret Crusade Has Imperiled the Church and How It Can Be Saved* (Fox 2011). In Spring, 2011, he nailed the 95 Theses in Italian to the door of Basilica di Maria Maggiore in Rome, overseen by Cardinal Law, formerly of Boston, and notorious for his role in the pedophile priest scandal.

Matthew Fox continues his work as a visiting scholar with the Academy of the Love of Learning in Santa Fe and as author, freelance speaker, educational innovator, and social activist, connecting with the growing Occupy movement. His social activism includes inviting spiritual seekers into exciting new possibilities as a relevant postmodern spiritual force. Fox validates what many people intuit to be good, true, and beautiful, and he invites them to make positive, healing changes in the world. Matthew Fox’s spiritual activism is the monumental work of a spiritually devoted, exceptionally gifted thinker who dares to cut through the museum-like institutional rigidity of a past era’s remnants of religion and generate central

elements of an exciting, bold new visionary era of cultural renewal.

Frankl, Viktor

Haddon Klingberg Jr.

North Park University Chicago, Evanston, IL, USA

Viktor Emil Frankl, M.D., Ph.D. (1905–1997) is founder of logotherapy – meaning-centered psychotherapy. He is best known for his short book, *Man's Search for Meaning (MSFM)*. It was released in 1946 by Deuticke, Freud's Viennese publisher. It appeared in English in 1959 as *Death Camp to Existentialism*, and for more than half a century, it has remained an international best seller, published in over 30 languages, numerous English editions, audiobooks, and Braille. In 1991 the United States Library of Congress/Book-of-the-Month Club survey of lifetime readers named it one of the ten most influential books in America. Karl Jaspers labeled it “one of the great books of mankind”; Gordon Allport called it “a compelling introduction to the most significant psychological movement of our day.” Of Frankl's 32 books, others have been translated into multiple languages, including English.

Frankl first visited the United States in 1954 at the invitation of Norman Vincent Peale. Frankl lectured at Marble Collegiate Church, New York, where Peale had arranged for Christian symbols to be covered with drapery out of respect for his Jewish guest. From that beginning, Frankl made 92 speaking tours to the United States and lectured worldwide – at 209 universities and to large public audiences on all five continents.

Life and Context

Viktor Frankl was born March 26, 1905 at Czerningasse 7 in Leopoldstadt, the mainly Jewish quarter of Vienna. His parents were humble, pious Jews. At that time, the city was seat of a great empire and an international wellspring of music. The University of Vienna was a hub of creativity and at the forefront of medical science.

But there was also a strong and longstanding current of anti-Semitism in the city.

In the year of Viktor's birth, 50-year-old Sigmund Freud was living near the University. Alfred Adler (1870–1937) was a founding member of Freud's inner circle and was living and practicing medicine at Czerningasse 6, right across the street from the Frankl home. Today tablets on the two buildings note the famous former residents.

When Viktor Frankl was a little boy, an obscure Adolf Hitler – in his 20s – was living in a men's hostel in the next district. No one could have imagined the future for Jews in Vienna, certainly including the Frankls and the older Freuds. Both lost close kin and friends to the Holocaust.

Sigmund Freud, Gabriel Frankl (Viktor's father), Alfred Adler, and eventually Viktor himself all attended the same high school in Leopoldstadt. Viktor was captivated by Freud's theories and writings, even introducing his classmates to psychoanalysis. All four of these men, in turn, attended the University Medical School; only Gabriel could not afford to finish. Though Viktor met Freud only once, they did corresponded with one another; and when Viktor sent one of his high school papers, Freud published it in the *International Journal of Psychoanalysis*.

While still a medical student, Frankl almost joined Freud's Vienna Psychoanalytic Society, but already he was becoming disillusioned with psychoanalysis. Freud became intolerant of Adler's criticism and inventive ideas and had excluded him from the Society. The young Frankl joined Adler's new Society for Individual Psychology. But in the end, when Frankl expressed his own novel ideas, Adler expelled him. So Jung (who had parted with Freud in 1913), Adler, and Frankl started their own rival psychological movements. But of course the creative influence of Freud on them, on psychology and psychiatry, and on Western civilization was enormous.

By the time Hitler and National Socialism seized Austria and engulfed Europe, Frankl already had established his practice in neurology and psychiatry. But for the Frankls and for

millions, life as they had known it came to an end. In September 1942, Viktor and his wife Tilly, his father and mother, and mother-in-law were forcibly deported in one of the ongoing trainloads of Jews from Vienna. During 2 years in the Theresienstadt ghetto, Frankl's father died from illness. The rest of the family were transferred to Auschwitz in October 1944, where Viktor and Tilly were separated and where his mother Elsa was sent immediately to the gas chambers. Viktor's brother and other family and friends met their deaths in the camps. He did not know the fate of his mother or of Tilly, who died at Bergen-Belsen, and he held out hope that he would be reunited with them after the war.

Frankl spent 3 days at Auschwitz (in Poland), then 7 months at Kaufering and Türkheim in Germany, where he nearly died of typhus. After two and a half years in the four camps, he was liberated from Türkheim by American forces in April 1945. On his return to Vienna, he learned that his loved ones had perished.

Now alone, Frankl threw himself into reconstructing his first book, *The Doctor and the Soul*, and wrote his second, *MSFM*. These tasks kept him going for a time. Then he married a young dental assistant, Elly Schwindt, at the Polyclinic where he had become chief of neurology. For more than 50 years, Viktor and Elly lived as spouses, parents, and colleagues in logotherapy, corresponding, writing, traveling the globe, and seeing the endless stream of visitors coming from around the world. Viktor died in Vienna following open-heart surgery in September 1997 at the age of 92.

Logotherapy and Existential Analysis in Context

Frankl's thought was shaped not only by the psychologists of Vienna but by great philosophers – the ancient Greeks, Nietzsche, Kierkegaard, Heidegger, Marcel, Jaspers, Buber, etc. – and a number of the contemporaries he knew personally. What Frankl created, starting in the 1930s, is what he eventually called “logotherapy and existential analysis” (Frankl 1986, 1992; Frankl

1997a, 2004; Gould 1993; Klingberg 2001). “Existential analysis” in his scheme referred to its philosophical foundations in contrast to psychoanalysis and “logotherapy” to its therapeutic methods. When the term existential analysis was adopted by others and used more widely, Frankl simply used logotherapy to identify his body of work.

The Greek *logos* connotes, among other things, *meaning* – hence, therapy through meaning. By 1948 Wolfgang Soucek had identified logotherapy as the third Viennese school of psychotherapy, a designation that endures. The first school is Freud’s psychoanalysis, marked by the “the will to pleasure” and by Freud’s ingenious expedition into the unconscious and its sexual and aggressive forces – “depth psychology.” The second is the individual psychology of Adler, distinguished by the “will to power”, striving to overcome feelings of inferiority in our relations with other people, to achieve success and status. While Frankl acknowledged the work of Freud and Adler as foundational to his own, he asserted that the unique and most significant human motivation is the *will to meaning* – “height psychology.” Frankl was fond of quoting Nietzsche: “He who has a *why* to live can endure almost any *how*” (Frankl 1992).

This cornerstone of logotherapy was tested in the crucible of the death camps. Frankl never claimed that simply having a reason to live could keep a prisoner alive against the odds. In *MSFM* he identifies many factors in his own survival in addition to his desire to see his loved ones again, to write his books, and to lecture again on logotherapy (Frankl 1992; Klingberg 2001). But he did insist that having a reason to live helped to keep up one’s spirit and finding meaning in suffering could help one to bear it. Meaning was necessary but not sufficient for survival and could – all other things being equal – make the difference between life and death.

Logotherapy aims to help by assisting people in finding meaning in their lives. Frankl identified three primary ways to discover personal meaning. The first way is by *doing a deed*. This may include creating art or music, nursing a child, baking a pie, accomplishing a task, or loving another person.

The second way is by *experiencing life*. One can enjoy the art and music of others, witness a sunset, accept kindness from someone, or rest in the affection of a loved one.

The third path to meaning is an anchor point of logotherapy: *meaning through suffering*. To suffer for nothing or to suffer when there is no point to it is unbearable. But if one can find a meaning in unavoidable suffering, it becomes possible to bear it, even to rise above it (Bulka 1998; Frankl 1978, 1992; Klingberg 2001). This helps to explain why so many people in life-threatening circumstances turn repeatedly to *MSFM* and give copies to others who are suffering. Logotherapy is complementary to other psychotherapies and fills a gap for people who no longer can take action to change their circumstances or who face an unavoidable fate.

Transcendence is a unique aspect of human nature, making it possible for us to rise above ourselves and our circumstances. Logotherapy has techniques that may apply to particular psychological disorders and mental illnesses (Frankl 2004). But it directly addresses the despondency of living life without meaning, especially amid setbacks and disappointments. The emptiness experienced by many in our time is what Frankl called “the existential vacuum.” And he insisted that despondency over the meaninglessness of life is no mental disorder at all, but rather a sign that one is truly human, by nature summoned to tasks, causes, and relationships beyond self. This, then, is the opening for faith.

Logotherapy and Religion

Logotherapy has a distinctive affinity for religion and for people of faith. But Frankl steered away from the sectarian, striving to make logotherapy useful to all people, religious or not, since the quest for meaning characterizes human nature. Individuals find meaning for themselves in many ways, and faith in a Supreme Being or adherence to a particular religion may be paths to meaning. So psychotherapy should respect this, as well as other paths to what he called *ultimate meaning* (Bulka 1979; Frankl 1997b; Tweedie Jr. 1961). It never prescribes a particular meaning for another

person but rather assists and encourages each person to pursue and discover both ultimate meaning and the moment-by-moment meanings of life.

Early on, Frankl identified the characteristics of being human: spirituality, freedom, and responsibility. Frankl clearly intended that those who choose faith in God be affirmed and assisted in bringing religious resources to bear upon their lives and struggles. Frankl's own writings reflect his openness to religion, though he remained steadfastly private as a person of faith. (Only a few very close to him knew of his daily prayers – without fail – from the time of his liberation from the concentration camps to the day of his death.)

Regarding human nature, Frankl rejected the negativity of psychoanalysis. He also criticized the unbridled optimism and self-centeredness of the American “human potentials movement” inspired partly by Adler. Ever since the Holocaust, Frankl has been reproached as too forgiving of the perpetrators and for his repeated assertions that good people and bad people are found in *every* race, *every* nation. All individuals and all groups are capable of great good and great evil, and we must be on guard against all evils, holocausts and “ethnic cleansings.”

Frankl stands out among European psychologists of religion for placing *transcendence* at the center of logotherapy. Erich Fromm (1950), himself a Marxist atheist, asserted that both Freud (1961) and Jung (1938) had missed the point on religion. For Freud, the unconscious is the worst that is in us; for Jung, the unconscious is the best that is in us. For Fromm, the unconscious is simultaneously the best *and* worst in us, neither “a God whom we must worship nor a dragon we must slay” (Fromm 1950). In contrast, Frankl's insistence on transcendence leads away from unconscious processes toward the human ability to take a stand toward circumstances and to rise above them, as well as to address faith in transcendent terms. That is, the fact of transcendence in human nature points away from self and circumstances toward something or someone, some cause *other* than oneself, *beyond* oneself, and *greater* than oneself.

Thus, from Frankl's perspective it can be said that Freud, Jung, as well as Fromm – and William

James (2002) and others, for that matter – *all* miss the point. Frankl might characterize them as reducing religion to merely psychological phenomena, to experience, conscious or unconscious, and ignoring the transcendent nature of human spirit, which may address or apprehend – or be apprehended by – a transcendent God existing in reality beyond. Frankl insisted that to find meaning, a person *must* go beyond oneself to a purpose to fulfill, a cause to serve, a person to love, or a God to trust if they so choose. And in transcending ourselves we become fully human and find meaning in our lives that carries us even above suffering.

Freud and Jung as Natural Complements

Anthony Badalamenti

Scientific Support, Westwood, NJ, USA

Sigmund Freud (1856–1939) and Carl Jung (1875–1961) were physicians who created psychologies to address issues of human suffering and, to a lesser degree, of human fulfillment in their patients. They shared the view that making previously unconscious material conscious was central to achieving the stated goals. They also shared the view that the interpretation of dreams is a fundamental tool for access to unconscious processes that are often not observable elsewhere in a person's life or observable to only a limited degree. The empirical basis for their shared views was their work with the details of their patients' lives and with aspects of the world's literature, including myths and fairy tales, sacred writings, anthropology and the works of gifted authors such as Shakespeare or Goethe. Both regarded psychological suffering as rooted in developmental arrest, whether this is understood in an environmental, organic or other sense. The natural complementarity of Freud and Jung begins to emerge by examining what each meant by making previously unconscious material conscious as well as by the meaning of developmental arrest.

Freud's approach to the psychoneuroses, as they were then called, was biological and led him to hypothesize three successive but

overlapping developmental stages from birth to approximately age five. Each of the oral, anal, and phallic stages enters additional structure and adaptive capacity into the emerging personality and in his model arrest within any of these stages results in psychoneurosis. He accounted for the psychoneuroses with a mechanistic model for the emergent structure seen in the first five years of life. The components of his model are the id, ego, and superego. He defined the id as the seat of the instincts, both sexual and aggressive, where instinct refers not to innate patterned behavior but rather to drives, often felt as needs. The ego is the adaptive center of the psyche that manages fulfillment of id impulses subject to the constraints of reality and of the superego. The superego has esteem granting power for compliance with parental requirements and the power to punish via guilt for violation of said values. Freud also felt that the superego could have phylogenetic parts (Freud 1920, 1933). Using these primitives, Freud defined a neurosis as an ego/id conflict, a psychosis as an ego/reality conflict, and manic-depressive illness as an ego/superego conflict, where all such conflicts correspond to developmental arrests in the first five years. Each form of conflict features the use of defense mechanisms by the ego to prevent id or superego trends that are perceived as dangerous by the ego from integration into the personality as a whole and especially from integration into the conscious part of the ego (Freud 1923, 1926).

The goal of therapy for Freud was the work of lifting defenses, such as repression, denial, reaction formation and regression, so that the associated, unconscious blocked material could begin to enter consciousness and enable further integration of personality. This brings symptom formation to an end and results in the previously blocked material resuming its original growth into further adaptive structure and capacity. It is here that the idea of making the unconscious conscious enters as a therapeutic concept and that the idea of transference as a means to expedite such making enters. Transference refers to the patient's tendency to repeat early emotional attachments to key figures with the analyst. For Freud, this was an opportunity to observe a repetition of early life events and

to discover the roots of the patient's pathology. The analyst's work is to interpret how the patient's transference distorts his experience of the analyst so that the patient can create the capacity to consciously reexperience the original pathogenic material from early life. Freud regarded the use of dreams in the same light. In his model, dreams are fulfillments of long-standing frustrated wishes from childhood, these being the pathogenic roots of the patient's disorder (Freud 1910). The idea of interpreting dreams and the transference for therapeutic results come together in Freud's model because he regarded the mechanism for the formation of symptoms, whether repeated in the transference or not, and that of dreams as the same (Freud 1900).

The biological character of Freud's approach is seen in his concepts of id, ego and superego in the idea of psychoneurosis as rooted in conflict, in defense mechanisms, in the transference, in dream interpretation and in the equivalence of the mechanisms of dream and symptom formation. It is also in evidence in his nosology for psychological disorders which relates each of them to a specific id, ego and superego developmental arrest, clearly following a medical model in the psychological domain.

Jung's psychology emphasizes man's relation to nature and the cosmos far more than it does mechanism or even structure. Nature refers to the life-creating aspect of the cosmos and the cosmos to the entire human environment both locally and otherwise. A fundamental primitive of Jung's psychology is his concept of the ego, referring to the conscious part of the psyche. Although his concept of the ego includes elements of the person's adaptation to life, his is not the same as Freud's definition of the ego (Jung 1954, 1969a).

A second important primitive of Jung's model is the concept of an archetype. He often referred to an archetype as a pattern of behavior because he tended to emphasize not the inner nature of an archetype itself but rather the structure and capacities it generates when activated. To a good approximation, an archetype is an inherent organizer of aspects of the psyche and can be understood in much the same way as organizers in the context of embryology. Two of the most used

archetypes are the anima and the animus, referring to the feminine aspect of a male and the masculine aspect of female, respectively. The unfolding of the feminine in a male is governed or ordered by the anima and similarly for the unfolding of the masculine in a female by the animus. Some other archetypes Jung often referred to are the self, rebirth, mother, spirit, wise old man and trickster, the last common among Native Americans (Jung 1969a, b).

Jung postulated a collective unconscious, consisting of the archetypes conferred by nature and the cosmos on the human race and held in common by everyone. The adaptive demands of life could, in Jung's model, stir one or more archetypes to generate fresh structure in a person's psyche. Jung, however, did not regard this as the only form of activation and, at many points, left the activation to yet to be identified forces and principles in nature. He regarded the psyche as an interacting sum of the ego and the unconscious where the ego, though evolving, is ever finite and the unconscious unlimited, both in potential and in its relation to nature and the cosmos. The idea of interaction refers to that between ego consciousness and the archetypes of the collective unconscious. This begins to locate the meaning of making previously unconscious material conscious and of developmental arrest in his model (Jung 1954).

A developmental arrest or failure to achieve more wholeness arises because ego consciousness opposes the unfolding of one or more needed archetypes. This can happen at any point in a lifetime and tends to happen repeatedly in the course of a lifetime. Jung hypothesized that a person's ego avoids conscious contact with archetypal contents by attributing them to others, a mechanism he referred to as projection. Jung's use of projection is similar to but different from Freud's where projection means attributing one's own emotional state to others in order to deny its presence in the first person. The making of previously unconscious material conscious corresponds to the therapeutic task of opening the ego to assimilation of the unconscious archetypal contents, that is, to resolving the projections. Where conflict between or among the id, ego and

superego is a centerpiece of pathology in Freud's model, it is an opposition between ego consciousness and the collective unconscious that is central to Jung's. Transference between patient and analyst is one of the ways Jung felt that such opposition could be resolved, leading to desired growth. He regarded transference as bidirectional so that each of patient and analyst transfers onto the other (Jung 1966).

Transference refers mostly to the patient projecting archetypal contents onto the analyst. Some of the analyst's work is to bring a patient to see that what is projected belongs, in the first instance, to the patient and indeed corresponds to contents that are seeking assimilation into his conscious ego. This is an instance of Jung's idea of conjunction, where opposites meet in the psyche – here the conscious ego and aspects of the collective unconscious. The conjunction gives rise to something new in the psyche, built from the opposing parts. The conjunction is an essential part of individuation, understood as a movement toward greater psychic wholeness. Since the process is bidirectional, the analyst also projects contents onto the patient; the analyst's training is presumed to be adequate for him to resolve his own projections. The contents that enter projection are not limited to ideas on neurosis or psychosis but include the subject's spiritual orientation (Jung 1966, 1967).

As with Freud, the interpretation of dreams is a basic tool for divining aspects of the subject's unconscious experience within the transference and elsewhere in his life. Freud's concept of dreams as wish fulfillments is generalized in Jung's model to dreams as compensations. For example, a female who is under-assertive could have dreams that feature images of great strength and ferocity, these images being compensatory in the dream to the person's conscious, waking attitude. Jung identified another kind of a dream, termed a "big dream" in which the dreamer experiences images that indicate an archetypal awakening. Such dreams are of great moment in the subject's life and would be unlikely to occur with frequency.

The complementary nature of Freud's biological to Jung's cosmic perspective now emerges

more strongly. Freud's medical model divides the psyche into id, ego and superego and locates consciousness dominantly in the ego, the psyche's adaptive center. The goal of psychotherapy is to make the unconscious conscious by lifting defenses as manifested in the transference. Jung's model divides the psyche into a finite ego defined as the conscious part of the personality. The goal of psychotherapy is again to make the unconscious conscious but by dissolving projections onto the analyst within the transference. With Freud the outcome of successful psychotherapy is the ending of conflict between or among the id, ego and superego followed by the maturation of previously blocked material into further capacities for adaptation. The outcome features the ego's expansion via the assimilation of id contents as well as modification of the superego. With Jung the outcome of successful psychotherapy is the ending of conflict between the ego, as defined within his model, and unconscious archetypal contents followed by the maturation of previously blocked material into further capacities for conscious adaptation. However, the outcome also sees an expansion of the subject's conscious spiritual aspect via the assimilation of archetypal contents that direct the psychic expression of nature and the cosmos (Jung 1970).

Freud used his concept of a superego to account for the roles of self-esteem and guilt in healthy and unhealthy development as well as in self-regulation. Although Jung offered no systematized concept of guilt, he did postulate that both good and evil are real in the cosmos, rejecting the idea that evil is the absence of good. In developing his concept of the conjunction and archetypal unfolding, he held that the resulting new psychic contents could work for well or against it, a complementary image of Freud's superego.

The fundamental research unit for Freud was an object relationship or how one's interactions with significant others, especially in childhood, shape the psyche. His core ideas of id, ego and superego arose from his research into object relationships (Freud 1923, 1933). A basic research unit for Jung was man in relation to the cosmos. Where Freud addressed pathology versus adaptation, Jung addressed pathology versus

connectedness to the cosmos. The complementary nature of Freud and Jung can be summarized by noting that where Freud regarded a person as healthy if he could work and love, a point on which Jung agreed, Jung regarded health as an outcome of a sound relatedness to nature and the cosmos (Jung 1967, 1970).

Freud, Sigmund

Benjamin Beit-Hallahmi
 Department of Psychology, University of Haifa,
 Haifa, Israel

Sigmund Freud (1856–1939) is most often mentioned today in relation to psychology and psychiatry, but he had little no training in these fields. In reality he was a well-respected neurologist who developed an approach to human behavior known as psychoanalysis. Freud was a man of enormous learning and huge capacities and talents. His writings, which fill up about 30 volumes, cover all aspects of human experience, culture, and history.

The creation of psychoanalysis offered at once a theory of the human psyche, a proposed treatment system for the relief of its ills, and a method for the interpretation of culture and society. Despite repeated criticisms and rejections of Freud's work, its influence remained powerful well after his death and in some fields far removed from psychology as it is narrowly defined.

Freud was trained as a physician and was drawn to neurology and psychiatry, but he was always more interested in theory than in practice. After starting his work with neurotic patients, he came to believe that many mental disorders are the product of unconscious conflicts. Freud suggested that humans are born with sexual and aggressive instincts, but starting early on in life, they must repress such desires, driving them away from conscious awareness. Some repressed desires do not disappear but unconsciously haunt our behavior and thoughts. Dreams, slips of the tongue, and neuroses are, Freud argued, distorted reflections of repressed desires that originate in childhood. Psychoanalytic practice aimed to uncover such hidden mental processes. Thus, dreams are the disguised expression of wish fulfillments. Like neurotic symptoms, they are the effects of compromises in the psyche between desires and prohibitions in conflict with their realization. Slips of the tongue and similar everyday errors, Freud claimed, had symptomatic and thus interpretable importance. But unlike dreams they need not betray a repressed infantile wish yet can arise from more immediate hostile, jealous, or egoistic causes.

Another kind of everyday behavior Freud analyzed was humor. Seemingly innocent phenomena like puns are as open to interpretation as more obviously tendentious, obscene, or hostile jokes. The powerful and joyful response often produced by successful humor, Freud contended, owes its power to the release of unconscious impulses, aggressive as well as sexual.

Two assumptions were suggested by Freud to characterize his approach. The first states that all psychic processes are strictly determined (no accidents, chance events, or miracles can be referred to as explanations), the second that

unconscious mental processes exist and exert significant influences on behavior. These unconscious forces shape much of the individual's emotional and interpersonal experiences.

We all are ready to admit momentary, fleeting, childish, and irrational thoughts, but we consider these experiences marginal. Psychoanalysis claims that they may be much more than trivial or marginal and that unconscious processes are possibly the main determinants of observable behavior.

The emphasis on unconscious processes in personality can be summed up as follows:

1. Large parts of the personality are unconscious, and these are the more important ones.
2. Unconscious memory is the repository of significant early experience.
3. In an adult, unconscious ideas are projected, creating severe distortions of reality, especially interpersonal reality.

Freud did not invent the idea of the conscious versus unconscious mind, but he certainly was responsible for making it popular. The conscious mind is what you are aware of at any particular moment, your present perceptions, memories, thoughts, fantasies, and feelings. Working closely with the conscious mind is what Freud called the preconscious, what we might today call "available memory": anything that can easily be made conscious, the memories you are not at the moment thinking about but can readily bring to mind. No one has a problem with these two layers of consciousness. But Freud suggested that these are the small and marginal. The largest part by far is unconscious. It includes all the things that are not easily available to awareness, including many things that have their origins there, such as our drives or instincts, and things that are put there because we cannot bear to look at them, such as the memories and emotions associated with trauma.

According to Freud, the source of our motivations is unconscious, whether they be simple desires for food or sex, neurotic compulsions, or the motives of an artist or scientist. And yet, we are often driven to deny or resist becoming

conscious of these motives, and they are often available to us only in disguised form.

Freud devoted much attention to the development of sexuality in the individual. He described how this development is prone to troubling maladjustments if its various early stages are unsuccessfully negotiated. Confusion about sexual aims or objects can occur at any particular moment, caused either by an actual trauma or the blockage of a powerful urge. If this fixation is allowed to express itself directly at a later age, the result is what was then generally called a perversion. If, however, some part of the psyche prohibits such overt expression, then, Freud contended, the repressed and censored impulse produce neurotic symptoms. Neurotics repeat the desired act in repressed form, without conscious memory of its origin or the ability to confront and work it through in the present.

One great insight we were led to by classical psychoanalysis is that the child is totally confused by the notion of parenthood and family relations. Learning that we have two parents and that father and mother are also man and wife is beyond the child's comprehension at first blush. This Oedipal confusion stays with all of us forever, processed, accepted, and sometimes denied. The denial of birth is no less important than the denial of death in the making of cultural fantasies. Both lead to much psychic tension and sometimes to real violence.

Focusing on the prevalence of human guilt and the impossibility of achieving unalloyed happiness, Freud contended that no social solution of the discontents of mankind is possible. The best to be hoped for is a life in which the repressive burdens of society are in rough balance with the realization of instinctual gratification and the sublimated love for mankind. But reconciliation of nature and culture is impossible, for the price of any civilization is the guilt produced by the necessary thwarting of man's instinctual drives. Psychoanalytic ideas have been immensely influential in Western thought over the past 100 years, since the inception of this intellectual movement by Sigmund Freud.

Psychoanalysis is a theory of struggle, conflict, and compromise, assuming the dynamic nature of

human behavior, always resulting from conflict and change. Additional assumptions reflect the idea of overdetermination and the multiple functions of behavior. The overdetermination assumption states that any segment of behavior may have many preceding causes. This is tied to a developmental or historical emphasis, leading us to seek first causes in any individual's personal history and unique experiences.

Psychoanalysis proposes a universal sequence of psychological development, which becomes a basic epistemological ordering of the world and of individual personality, culture, and humanity. The universal experience of the human infant includes a developing awareness of three realms, always in the following order: first, one's body and its experienced needs; second, awareness of the existence of another human; and third, knowledge and emotional investment in relations between itself and other humans. All further experiences must be based on these early experiences, acquired in that order, and will be assimilated into that order. The existence of such a universal sequence cannot be challenged, and therein lies the attraction of psychoanalysis for those wanting to understand not only the human personality but also human society and culture.

The problem of childhood is a central issue defining psychoanalysis. The infant's unrealistic drive for wish fulfillment is supposed to be left behind by the adult, but childhood is always alive behind adulthood facade. The legacy of childhood is far from marginal, and it is coexistent with adult functioning. We can observe it on both the individual and the cultural levels.

Freud's ideas about development focus on what has come to be called psychosexual development, that is, the transformation, molding, and sometimes perversion of biologically determined erotic drives in early childhood. The focal point of psychosexual development is the Oedipus complex, woven around the child's attachment to its parents as love objects or identification models between the ages of 3 and 6. Early childhood experiences serve as historical precedents in every individual's life, and in the life of every human culture.

The psychoanalytic view of human motivation is often regarded as utterly pessimistic, but we have to admit that it is realistic. Judging by their conscious and unconscious drives, humans are undeniably nasty and brutish, aggressive, and infantile. However, beyond this bleak picture of immorality and perversity lies the capacity for sublimation, love, and cultural creativity.

The psychoanalytic view of maladaptive behavior emphasizes its continuity with adaptive behavior and leads to viewing pathology as a useful analogy of cultural structures. Moreover, maladaptive behavior is analyzed through the detailed recognition of defensive sequences, that is, not only the final outcome – symptoms – but the internal sequences leading to it are carefully outlined.

The theory presents us with an ideal of flexibility and moderation which is presented, as opposed to rigidity which is pathological but inevitable. Rigidity in the form of rituals and ritualized defenses become one the sources of analogies for religion. The analytic starting point of symptom and syndrome, and their unconscious background, serve as the model for looking at religion.

Psychoanalysis assumes the psychic unity of mankind, which is significant when we deal with cultural traditions. Universality is found at the most basic level of body, birth, sex, and death. This working assumption has a particular relevance to the phenomenon of religion. Universal themes in religious mythology are the result and reflection of the psychic unity of mankind, which in turn is the consequence of common psychological structures and common early experiences shared by all mankind. The same basic psychological processes and complexes are expressed in individual products (dreams, stories, daydreams) and in cultural products (art, literature, folklore, wit, religion, law, science), because these complexes are basic and central to human experience.

Freud's writings are among the most ambitious attempts in history to present a comprehensive interpretation of religion. The topics Freud dealt with include, first of all, a developmental theory of religion, for humanity as a whole and for each individual. Freud also attempted to explain the

functions and consequences of religion, for both society and the individual.

Freud's theoretical explanation for the origin and existence of religion is based on certain presumed universal psychological experiences and processes: the universal experience of helplessness, the tendency for compensation through fantasy, and the experience of early relations with protective figures. Every individual is psychologically prepared by these universal experiences to accept religious ideas which are obviously culturally transmitted. The question about the world of spirits is: Does this world exist "out there" and if it does not where is it. The psychological answer given by psychoanalysis is that it exists within, in our own mental apparatus and our own mental abilities to fantasize and project. The world of spirits, the supernatural world unseen and somehow felt in religious experience, is a projection of the internal world. Psychoanalytic theory explains both the origin of supernaturalist ideas and their specific contents.

Freud's theory does not suggest that the individual creates his religion on his own, out of nothing, but that childhood experiences within the family prepare the individual for the cultural system of religion. Belief in omnipotent gods is a psychic reproduction of the universal state of helplessness in infancy. Like an idealized father, God is the projection of childish wishes for an omnipotent protector. If children can outgrow their dependence, he concluded with cautious optimism, then humanity may also hope to leave behind its prevalent and immature fantasies.

Psychoanalysis has had more to say about religious actions than any of the various traditions in academic psychology. It is the one psychological approach to the understanding of religion which has had a major effect on both religion as an institution and on the study of religion. Psychoanalytic approaches to the question of culture and religion, and to the question of individual integration in society, have affected all social science disciplines. The psychoanalytic study of religious beliefs and institutions has drawn considerable attention on the part of scholars in the fields of religion, history, sociology, and anthropology. Psychoanalysis is the only major psychological

theory which offers an explanation of religion as part of a comprehensive theory of human behavior, in which religion is presented as an instance of general psychological forces in action.

In this area, as in many others, Sigmund Freud's writings offer a rich variety of hypotheses regarding various religious beliefs and practices. Some of the better-known hypotheses derived from psychoanalytic theory are the father-projection hypotheses, i.e., the idea that the images of the gods are derived from childhood experiences with paternal (and maternal) figures, and the superego projection hypothesis, i.e., the idea that the gods are a reflection and echo of the unconscious and severe conscience which all humans share.

Judging by their immense influence in all the academic fields which study religion, psychoanalytic ideas seem to be of truly enduring value for the psychological understanding of religion. We really have no other theory that matches the scope of psychoanalytic interpretations of culture and religion. Enlightening, that is the greatest compliment we can pay psychoanalytic ideas and that is exactly what psychoanalytic approaches wish to be. They represent the continuation of Enlightenment tradition in regard to human activities around ideas of spirituality and the sacred.

Freud, Sigmund, and Religion

Lorna Lees-Grossmann
Department of Psychosomatic Medicine,
Klinikum Rechts der Isar, Munich, Germany

Freud was notorious for his antireligious stance. He seems to have gone out of his way to offend believers, referring to the “barbarous god of volcanoes and wildernesses whom I grew to dislike very much” (Freud 1970, p. 102). Despite this, he accepts that in some cases the mild neurosis of religion was preferable to a more complex and distressing disorder and argues the parallels between religion and psychoanalysis are striking.

Neurosis

Religion itself for Freud is a form of madness (Freud 1995a, SE XII: 269). He draws an analogy between the faith-based belief of the religious believer and that of the paranoid, who clings to his or her paranoid delusion in spite of any and all evidence to the contrary. He draws another between the ceremony and ritual associated with religious practice and the obsessive’s need to engage in repetitive behavior. Religion can rescue people from an individual neurosis, although it

does not cure them: it merely substitutes a universal neurosis for a personal one:

In view of these similarities and analogies, one might venture to regard obsessional neurosis as a pathological counterpart of the formation of religion and to describe that neurosis as an individual religiosity and religion as a universal neurosis (Freud 1995a, SE XII: 11126–11127).

The distinction between religion and what is commonly accepted as neurosis is merely in the numbers of participants involved: the paranoid indulges in a *folie à un(e)*, the religious in a *folie à tous*. The ritual inherent in religion makes it an obsessional neurosis: as a result of the unresolved Oedipus complex in the adult, the rituals of religion are aimed at propitiating the father and preventing his anger. Alternatively, religion can be seen as illusory: a wish fulfillment through projection. A strong desire can be externalized and become a belief in the same way that, when we sleep, a strong wish fulfillment is projected as a dream. In the case of Christianity, the prospect of eternal life is a fulfillment of the wish not to die.

Freud’s assertion is that the Oedipus and Elektra complexes are at the psychological core of all human beings. This sort of incestual tension necessarily has a negative effect on the family, and so the tension is neutralized through the transference of the desire for the parent onto a less divisive recipient.

In Christianity, God replaces the father figure and Mary the Mother of Christ the mother. The desire to kill the parent and thus escape the threat of castration is also accounted for in Christianity, argues Freud, through the crucifixion of Christ as part of the Holy Trinity. Christianity also allows for the expiation of guilt through its transference onto Christ, the perpetual sacrificial lamb. Religion is a sign that the Oedipus complex has not been successfully overcome.

Transference

The key issue at hand here is that of transference: it is the mode of healing in both psychoanalysis and religion. Jung wrote of his first meeting with Freud: “Suddenly he asked me out of the blue,

‘And what do you think about the transference?’ I replied with the deepest conviction that it was the alpha and the omega of the analytic method, whereupon he said, ‘Then you have grasped the main thing’” (Jung 1954, p. 8).

In transference in psychoanalysis, the analyst takes on the role of the parent, which is the role taken on by God in religious belief. This parallel was not lost on Freud, who despite his avowed disdain for religion recognized its potential as a healing mechanism as well as a symptom of neurosis.

Freud’s letters imply an uncertainty in his criticisms of religion that are not reflected in his work: he comments in a letter to Ferenczi that “I regard [*The Future of an Illusion*] as weak analytically and inadequate as a self-confession” (Jones 1962, p. 587). Also, when he found analogies to be insufficient proof against religion, he searched for historical proofs and delayed the publication of *Moses and Monotheism* because he was unable to find them and was therefore displeased with the work: “there is also the consideration that my contribution does not seem to me well founded enough nor does it please me much. So it is not the right occasion for a martyrdom. Finis for the time being” (Jones 1962, p. 622).

Freud attempted to dismiss the historicity of religion a priori with no regard for any information he might have received suggesting alternative theories to his already-concluded conclusion. For Freud, the belief in God is understandable to an extent, although he considered the belief to be unworthy of modern human beings and “to be understood on the pattern of the individual neurotic symptoms familiar to us” (Freud 1995b, SE XXIII: 58):

We understand how a primitive man is in need of a god as creator of the universe, as chief of his clan, as personal protector . . . A man of later days, of our own day, behaves in the same way. He, too, remains childish and in need of protection, even when he is grown up; he thinks he cannot do without support from his god (Freud 1995b, SE XXIII: 128).

What he found objectionable was not that these early and primitive people chose to accept the existence of a powerful God who would

protect them, but that the character of that God was changed to suit their own changing purpose:

[T]he Persian government of Egypt (of the fifth century BCE) conveyed information to them of the new rules of worship issued from Jerusalem. Going back to earlier times, we may say that the god Yahweh certainly bore no resemblance to the Mosaic god. Aten had been a pacifist . . . No doubt Yahweh was better suited to a people who were starting out to occupy new homelands by force (Freud 1995b, SE XXIII: 63).

Friedman, Edwin

Loren Townsend
Louisville Presbyterian Theological Seminary,
Louisville, KY, USA

Edwin Friedman (1932–1996) broke new ground in pastoral counseling by using Murray Bowen’s theory of intergenerational emotional family systems to explain complex interactions between religion, politics, and psychotherapy. Combining Bowen’s theory with his own rabbinical

experience, Friedman developed a model of congregational analysis and leadership that was broadly embraced by American church leaders.

A native of New York City, Friedman earned a doctorate of divinity from Hebrew Union College where he was ordained as a rabbi in 1959. During his distinguished career, he acted as Community Relations Consultant for the White House on desegregation issues (1964–1966), founded the Bethesda (MD) Jewish Congregation where he served as Rabbi until 1979, established a post-graduate training center for clergy and mental health professionals (Center for Family Process), and maintained a practice as a marriage and family therapist. Dr. Friedman was well known for his workshops for clergy, businesses, political groups, and military leaders.

As a family therapist, Friedman trained with Murray Bowen, a family therapy pioneer and professor of psychiatry at Georgetown University Medical Center in Washington, D.C. His landmark book, *From Generation to Generation: Family Process in Church and Synagogue* (Friedman 1985), is based on his observation that clergy stress is related primarily to family dynamics. He observed that clergy are involved simultaneously in three families: families within the congregation, the congregation as family, and the clergyperson's own family. These systems interlock and are governed by identical emotional processes that can be understood using concepts like differentiation, homeostasis, and triangulation drawn from Bowen's theory of family therapy. Friedman applied these concepts to clergy self-understanding, congregational life, and leadership.

From Generation to Generation (Friedman 1985) became a standard for clergy training and a platform for extending Bowen's theory through workshops and lectures. *Friedman's Fables* (1990) is a collection of stories that highlight family emotional dynamics in problematic human interactions. In his book, *A Failure of Nerve: Leadership in the Age of the Quick Fix* (1997, published posthumously), Friedman integrated Bowenian theory with 40 years of observations about American politics and organizational systems. He proposed a universal

principle: all social and organizational pathology is related to denial of emotional processes. This denial results in a widespread, regressive, counterevolutionary trend that is countered only by differentiated leaders who understand emotional process. Such leaders manage their own anxiety while taking unpopular stands that are automatically resisted by others' reactivity. Friedman's model is sustained through the Center for Family Process, Healthy Congregations, and a host of books and workshops based on his work (Richardson 1996; Steinke 2006).

Friedman's work has been widely embraced by church leaders. However, his model faces at least three substantial critiques. First, Bowen and Friedman's concept of differentiation can be interpreted as an embodiment of masculine values rather than a universal emotional principle (Leupnitz 2002). Second, Bowenian theory overvalues culturally specific nuclear family emotional process. Third, Friedman's model assumes that universal nuclear family processes can be generalized beyond family functioning to organizational and societal functioning. There is little empirical research to support either universal nuclear family processes or generalization of principles to organizations and society.

Fromm, Erich

William D. Roozeboom

Fuller Theological Seminary, Pasadena, CA, USA

Erich Fromm, though one of the most prolific authors of social psychology and psychoanalytic theory, is oddly less well known than others of this period. This is largely due to Fromm's multifaceted, interdisciplinary approach, which makes it challenging to locate him within a particular camp of thought. Fromm brought together Freudian theories with humanism, existentialism, Marxism, neo-Kantian thought, elements of Biblical prophecy, Talmudic writings, mysticism, and Zen Buddhism (Burston 1991). Nevertheless, Fromm is most simply known as a sociopsychological theorist and analyst, who combined Freudian psychoanalytical thought with Marxist social critical theory.

Fromm's intellectual interests and pursuits were likely influenced by his upbringing as the only child in a pious, orthodox Jewish home, where he received extensive Jewish religious education. Although Fromm did not remain active in his Jewish faith, its imprint remained as he studied sociology at the University of Heidelberg (receiving his Ph.D. in 1922). After his studies at Heidelberg, Fromm underwent psychoanalytical

training in Frankfurt, Munich, and Berlin and then helped form the Frankfurt Psychoanalytic Institute. In Frankfurt he became acquainted with the Frankfurt Institute for Social Research and later was an early leader in "The Frankfurt School," a Marxist and Freudian influenced group of social scientists who developed social critical theory.

Fromm emigrated to the United States in 1934 and taught and worked with others who were critiquing and expanding Freud's thought – particularly in terms of interpersonal or social psychology – such as Karen Horney, Harry Stack Sullivan, Clara Thompson, Frieda Fromm-Reichmann, and other "neo-Freudians." Following this he moved to Mexico City and taught the first courses of psychoanalysis as a part of the medical faculty at the National Autonomous University of Mexico.

Fromm defined himself as a nontheistic "radical humanist" yet acknowledged religion as a universal in human life (Fromm 1967). He did distinguish between authoritarian and humanistic religion but also asserted that religion in general has admirable goals for life and standards for living, such as truth, the decrease of suffering, autonomy, responsibility, the unfolding of human powers of love and reason, and the development of the higher nature or "soul" (Fuller 2008). Therefore, psychological disturbances occur because persons neglect the demands of the soul (Fuller 2008). Additionally, Fromm touched on similar existential tensions as theologian Paul Tillich and the ethical implications of Martin Buber.

Fromm's contributions were vast. First, Fromm was one of the first theorists to assert that the psychoanalyst is not a blank mirror as Freud believed; rather he or she must engage one's self and one's passion for his or her life and have the capacity for genuine empathy for the client in order to be helpful. Second, Fromm stated that self or "character" is developed and/or constructed socially and not merely via libidinal forces. Third, Fromm taught that a critical (social) theory is a prerequisite for contextualizing care for its hermeneutic of suspicion and deconstructive impetus towards meta-discourse(s). All of these elements were very early forms of what are now

common features of a postmodern psychological theory and practice.

Fundamentalism

Louis Hoffman¹ and Erica Palmer²

¹Saybrook University, Oakland, CA, USA

²AspenPointe, Colorado Springs, CO, USA

The term fundamentalism has been associated with a variety of meanings since its inception into the English language during the early twentieth century through Christianity. At the outset, it was intended to convey a belief in the need to return to *the fundamentals of faith* (González 1985). Increasingly, fundamentalism has been associated with a narrow, rigid approach to religious belief across various world religions. It is also commonly associated with conservative

religious, and sometimes political, beliefs. Fundamentalism, which originated as a term within Christianity, is now often applied to Islamic, Buddhist, Jewish, Hindu, and other religious groups. When used in popular culture today, fundamentalism often is intended to have a pejorative connotation to it. When considering fundamentalism, it is important to recognize how its meaning in popular, religious, and scholarly literature has evolved overtime.

Origins of Fundamentalism

The term fundamentalism emerged in the 1800s as a response to what was perceived as threats to Christianity (González 1985). These threats, which included evolution, were generally perceived as emerging from liberalism. Conservative theologians began focusing on the idea of the *fundamentals of faith*. This parallels the role of the creeds in early Christian history that sought to identify concise summaries of the essence of Christianity. The fundamentals, however, had a more specific purpose distinguishing Christianity from perceived liberal threats, which included liberalism within Christianity. Gonzalez notes that in 1895 the emerging movement identified five fundamentals that served as the initial cornerstone of fundamentalist Christianity: “the inerrancy of Scripture, the divinity of Jesus, the Virgin birth, Jesus’ death on the cross as a substitution for our sins, and his physical resurrection and impending return” (p. 257).

Fundamentalism as a Reaction to Modernism

Fundamentalism can be understood partially as a response to modernity and the secularism that accompanied it (Noll 1992). Several perceived threats to religion accompanied the development of modernity. First, religion was displaced from its privileged position in Western culture (Hoffman and Kurzenberger 2008). In premodern times, the church and religious authority retained the most influential positions of power in shaping the

masses. As modernism emerged, scientists, academics, and politicians became the new sources of authority and influence. Fundamentalism, in part, can be understood as an attempt to reclaim an authoritative place for religion.

Second, religious ways of knowing, which were generally based in claims of revealed knowledge from God or an ultimate authority, were called into question (Hoffman and Kurzenberger 2008). In premodern times, religion did not need to defend its ways of knowing; they were accepted as given. Fundamentalism served as a way of clearly defining what should be a given, or a fundamental of faith, that does not need to defend itself against scientific scrutiny.

Third, religion was changed by modernity. In premodern times, faith was sufficient. However, in modern times faith needed to be supported by science and rationalism. Systematic theology was replaced by apologetics, or a rational defense of faith. During modernity and into postmodernity, there was an increasing popularity in creationism in popular books, such as *The Case for Christ* by Strobel (1998), which claimed scientific evidence of the truth of religion. This represents a significant epistemological shift. Reason, which was considered an inferior way of knowing as compared to revelation or faith in premodern times, was now being incorporated into Christianity as a way of defending faith. Fundamentalism attempted to refute the need to consider these modernist ways of knowing through asserting that the fundamentals of faith were sufficient and did not need a rational defense.

The September 11, 2001, Terrorist Attacks and Fundamentalism

Although fundamentalism had already begun accumulating negative associations, the terrorist attacks on the Pentagon and World Trade Center Towers in the United States on September 11, 2001, powerfully impacted the way fundamentalism was understood. The terrorists were labeled “Islamic fundamentalists” and “Islamic extremists” by many in the news media and academic community. Through this, a polarized

extremism and fundamentalism became synonymous in popular culture as well as the academic literature.

The contemporary usage of the term fundamentalism is often used to distinguish a particular way of being religious or type of religiosity. Psychological measures, such as Fundamentalism Scale-Revised and Religious Fundamentalism Scale, have been developed to identify fundamentalism (Hill and Hood 1999). In these, fundamentalism is conceived as more absolutist and rigid. Fundamentalism is defined as being related to a less critical and more literal interpretation of sacred texts, more antagonistic and critical views of other religious groups, defensive of the correctness of a particular religious group or belief, and increased evangelistic fervor. These characterizations of fundamentalism have a degree consistency with the early religious attempts to define fundamentalism; however, they also incorporate new components as well.

Research on Fundamentalism

Since September 11, 2001, psychological theory and research attempting to understand and explain fundamentalism has become prolific. Most of this research can be seen in two broad categories: social-psychological research and personality research. Common to both approaches is the assumption that fundamentalism is often personally and socially dangerous and that fundamentalism tends to be a product of social and psychological forces more than religious factors.

Social psychological research emphasizes the role of the group or culture (Rogers et al. 2007). Terror management theory, one social psychological approach, suggests that mortality salience (i.e., reminders of death) increase in-group identification; these in-groups are often conservative or fundamentalistic. Friedman (2008), for example, found an increase in fundamentalism associated with mortality salience. Self-esteem, however, is conceived as an intervening variable. Low self-esteem increases the influence of mortality salience, while high self-esteem serves as a buffer therefore lowering the impact. From the

social psychology perspective, various personal factors such as psychopathology, tendencies toward conformity, and self-esteem may interact with contextual factors, such as mortality salience, to increase the likelihood of one developing a fundamentalist perspective.

Hood et al. (2005) represent one of the most thorough perspectives from the individual or personality side of fundamentalism. This is a more balanced perspective on fundamentalism, recognizing both the positive and negative sides of fundamentalism. From a more sympathetic viewpoint, fundamentalism often is part of a search for meaning and community. In general, however, fundamentalism has been associated with more negative concepts including authoritarianism, a rigid cognitive style, narrow-mindedness, and defensiveness against doubt (Spilka et al. 2003).

Empirical research has also associated fundamentalism with a number of outcomes. For instance, it is generally thought that individuals identifying with a fundamentalist worldview have a more oppressive patriarchal worldview, increased likelihood of prejudice, and a higher proclivity toward domestic violence (Spilka et al. 2003). As has already been discussed, there is also a frequently hypothesized link between fundamentalism and terrorism.

Positive Aspects of Fundamentalism

Although fundamentalism typically has been viewed as something negative, there is also evidence that fundamentalism can be connected to psychological well-being. Phillips and Ano (2015) found, for example, that religious fundamentalism was associated with beneficial approaches to religious coping. While religious fundamentalism was associated with better adjustment to stress, this was mediated by certain religious coping strategies. In the study by Carlucci et al. (2015), fundamentalism was positively associated with life satisfaction and psychological well-being. This demonstrates that fundamentalism is a complex concept that should not be reduced to something that is perceived as solely negative or solely positive in regards to intrapersonal and interpersonal well-being.

Conclusion

Fundamentalism is a complex topic that often is presented in an over-simplified manner. It is important to recognize that this is a term that has evolved over time and is understood differently in different contexts. The negative connotation that is typically associated with fundamentalism in contemporary popular and scholarly literature should not be generalized to all usages of this term. Furthermore, the research reviewed demonstrates that there are both positive and negative aspects of religious fundamentalism as it pertains to psychological and interpersonal functioning.

Fundamentalist Pastoral Care

William Sipling
Department of Catholic Studies,
College of Arts and Sciences,
University of St. Thomas (MN),
St. Paul, MN, USA

Overview and Context

Fundamentalist pastoral care refers to sets of helping professions and ministries that derive methods and techniques from biblical exegesis or application within the context of church and pastoral interventions. Adherents to fundamentalist pastoral care practices are often within the spectrum of conservative and evangelical Christian communities which provide care based upon theories such as biblical or nouthetic counseling, and by utilizing practices such as reparative therapy.

History, Introduction, and Definitions of Terms

Christian fundamentalism subscribes to a belief system and is bound to a worldview which describes the Holy Bible as infallible, free from all errors, and true “in all it affirms” (Mohler 2013, p. 36), in part as a response to perceived theological and ethical liberalism (Antoun 2010). This fairly recent viewpoint, known as Biblicism (Smith 2012), also includes the doctrine of perspicuity, which states that Christian Scripture must be able to be understood by any and all readers, regardless of cultural, linguistic, or

historical barriers that would normally apply to the hermeneutics of ancient texts (Richards and O’Brien 2012; Thompson 2016). These particular doctrines are unique as found among evangelical and conservative Christian communities; they have not been central or influential identifiers within mainline Christian, Roman Catholic, or Orthodox faith traditions.

Following developments in the twentieth century, such as the fundamentalist–modernist controversy and the scopes trial, evangelical Christian movements began to respond to the practice of secular psychology and psychiatry, trends which, from the Biblicist perspective, favored science and medication over Scripture and church membership (Adams 1984). From this perspective, to make use of clinical science would be to deny the doctrines of inerrancy and perspicuity, as innovations within evidence-based approaches could render the Bible lacking in “*everything* needed for life and godliness” (2 Peter 1:3, New Revised Standard Version, emphasis added).

In step with Jay Adams’ *Competent to Counsel* published in 1970, evangelical pastors and nonlicensed helping professionals began developing theories centered upon “biblical” or “nouthetic” counseling, wherein Scripture is used as a handbook or dictionary to identify psychological issues and to describe methods of treatment (Powlison and Coe 1999). Critical of values-neutral, nondirective, or evidence-based approaches, the biblical/nouthetic therapeutic helper is tasked with the role of a pastor-instructor, able to admonish the counselee from a position of relational authority for the purpose of educating the counselee toward better care of their soul (Powlison 2010).

Techniques and Theory

Augsburger and Malony (2007) outline a five-step model representative of many forms of biblical/nouthetic therapies: an opening prayer for guidance and direction, invitational worship or prayer to invoke God’s presence in the counseling session, proclamation to “speak truth” regarding God’s protection and guidance, a “creative

middle” where pastoral interventions may be included, and a closing benediction wherein the client is charged to walk in holiness and incorporate interventions from the session.

The role of the Bible is central in these counseling scenarios, both as handbook for learning useful life lessons (such as pithy quotations from the book of Proverbs) and also as a tool from which to gain prescriptive treatment plans. In these sessions, prayers are often read directly from Scripture, and the interventions often take on a homiletical or sermon-like form. Biblical narratives which relate to the client’s situation may be read as case studies, and if the narratives contain applicative principles – if there is a “moral of the story” to be found – these may be suggested to the client as action steps.

Fundamentalist pastoral care differs from other Christian frameworks of psychological practice. Integrative approaches may allow for modern scientific breakthroughs to affect or adjust one’s application of Scripture in counseling, whereas nouthetic approaches maintain that Scripture should be used exclusively, or that cognitive or clinical science may only play a subservient and secondary role (McMinn and Campbell 2009).

Concerns and Controversies

Fundamentalist pastoral care ideologies often maintain a suspicion toward modern trends within clinical science, particularly within the self-help movement and positive psychology. According to Adams, the language of self-care does not provide enough emphasis toward the Christian responsibility to take up one’s cross, to mortify the flesh, or to have sorrowful repentance for sinful actions (Collins 2007). The focus on occasionally strong language surrounding concepts of Christian guilt and shame within fundamentalist pastoral care may be damaging to traumatized populations, such as sexual abuse survivors (Fouque and Glachan 2000).

A further concern within fundamentalist pastoral care models is a direct or indirect rejection of evidence-based practices in psychology. Some fundamentalist pastoral care providers

may assume that clinical psychological methods originate from anti-Christian psychologists and psychologies, the results of which could nullify fundamentalist Christian beliefs in personal responsibility for sin, in a traditional view of human sexuality, or even in theism in general (Haque 2001). In these cases, there is a rejection of research and practice on the grounds of theological and biblical incompatibility. Indirect or passive rejection of evidence-based practices comes as a result of a lack of training in these scientific psychotherapeutic interventions (Worthington et al. 2013). Fundamentalist seminaries for pastoral (nonprofessional) counselors generally focus student curriculum within pastoral, biblical, and ecclesial subjects rather than within statistics, research ethics, and clinical topics.

An example of these applied fundamentalist pastoral care is found in the practice of conversion therapy, an approach which describes LGB experiences as sinful and disordered, and seeks to provide pastoral interventions to “convert” behaviors and thought processes into traditional fundamentalist ethics (McGeorge et al. 2015). However, in recent years, legislation for banning conversion therapy has been introduced in several US states (Hudson 2014), citing harmful outcomes in LGBTQ+ populations (Flentje et al. 2013).

G

Gardens, Groves, and Hidden Places

David A. Leeming
University of Connecticut, Storrs, CT, USA
Blanton-Peale Institute, New York, NY, USA

Gardens, groves, and other such “hidden” places are often sacred in religious stories. Gardens and groves and other hidden places can represent an earthly paradise, as in the Garden of Eden of the Book of Genesis in the Hebrew Bible. Like temples and walled cities, they are protected places, metaphors for cosmos, against ever-threatening chaos. They are places of birth or rebirth. Jesus is born in a humble stable; the Buddha is born in a grove. Muhammad receives revelation in a cave, the Buddha finds enlightenment under a tree in a grove, and Jesus prepares for his passion in the Garden of Gethsemane.

Psychologically, the sacred space in question may be said to represent the preconscious mind, the center of the world for the individual, and the place where the ego resides and in which it achieves revelation or awakening to self. It is also the place that can be threatened by outside forces such as those represented in the Abrahamic tradition by the Devil, who, in a sense, shares the garden – the psyche – with the individual.

Gayatri

Fredrica R. Halligan
Mind Body Spirit Institute, Stamford, CT, USA

Gayatri is one of the most ancient of Hindu goddesses, known to have been worshipped as “the Mother of the Vedas.” She is extremely powerful and is depicted with five heads (for the five elements of creation: earth, water, fire, air, and ether) and ten arms. In Hinduism goddesses are important because they represent the power (*shakti*) of their male counterparts.

The mantra dedicated to *Gayatri* is said to be the most potent of all *mantras*. It is a 14-word

prayer for enlightenment and is also spoken whenever a devotee is endangered. Because of its power, the *Gayatri mantra* should not be treated casually.

Psychologically, *Gayatri* and her *mantra* can be beneficial for twenty-first-century spiritual feminists both as a feminine god image and as a source for prayer and/or meditation.

Gender Roles

Philip Browning Helsel

Pastoral Care and Counseling, Boston College
School of Theology and Ministry, Chestnut Hill,
MA, USA

Gender roles refer to the social roles with which a person identifies relating to their gender. As social roles, they are “shared expectations that apply to persons who occupy a certain social position or are members of a particular social category” (Eagly 2000, p. 448). Gender roles exist at the intersection between subjective experience and cultural understandings of what it means to be a man or a woman, referring to a set of conditions that are broadly consensual within a culture. As such, gender roles are “injunctive norms” which depict how persons should behave, “[producing]

social disapproval and efforts to induce compliance” if they are broken (Eagly 2000, p. 449).

However, gender roles imply more than rational self-conscious participation in societal patterns. They also include “general mannerisms, deportment and demeanor; play preferences and recreational interests; spontaneous topics of talk in unprompted conversation and casual comment; content of dreams, daydreams, and fantasies; replies to oblique inquiries and projective tests; evidence of erotic practices, and finally, the person’s own reply to direct inquiry” (Rudacille 2005, p. 105).

Gender roles have a close but not equivalent relationship to gender identity. Gender roles fluctuate between the poles of identity and action, self-identification, and the way one is defined by others. The concept of gender roles refers not strictly to whether one thinks of oneself as male or female, but the way this conviction is played out in the cultural arena, including “situational constraints” that can maintain behavior that “seems fitting” to men and women (Rudacille 2005, p. 56). These cultural patterns tend to reinforce the needs of a particular society. Societies frequently cultivate “natural” explanations of gender which can be seen to shore up certain social practices. This tendency has been called the “sexual division of labor” and has been linked to wider economic needs and interests (Chodorow 1978, p. 3).

“Natural,” or essentialist, explanations of gender tend to describe men and women as possessing fixed qualities which inevitably lead to certain kinds of behaviors. In this “sex/gender scheme. . . [people] identify sexual difference with both biological/physiological dimensions (sex), and dispositional/psychological and social characteristics (gender)” (Jones 2000, p. 27). The common epigram “anatomy is destiny” is a well-known distillation of this concept. The primary challenge to this view has come from the feminist movement in Western societies at the end of the nineteenth century and beginning again in the 1960s (Rudacille 2005, p. 43). The critique of gender has varied in degree, with some suggesting

that the “raw material” of biological sex is the fundamental baseline which is then shaped by culture and circumstance. According to these theorists, the biological basis remains an “unalterable...given” that is fixed at a “chromosomal and genetic” level (Jones 2000, p. 35). Others suggest that the cultural construction of gender is even more thoroughgoing than this and that on an epistemological level, culture determines everything we know about being man and woman. At this level, the self is seen as a “space through which cultural constructs move...are contested and changed” (Jones 2000, p. 37).

Commentary

Psychoanalysis has placed a strong emphasis on the psychic impact of the memory traces of parents upon the development of the child. These memory traces are laid down through the activities of care for children and maintenance of the home, a province of activity that is adjudicated by gender roles (Bollas 1987, p. 24). The traditional oedipal story, which involves a boy's desire for his mother and rivalry with his father, has been expanded in a variety of directions as gender roles have become more flexible, with the understanding that this earlier model depended upon the father as the breadwinner and the mother as full-time homemaker (Mitchell and Black 1995, p. 257). More recent psychoanalytic explorations of oedipal conflict and sexual orientation have suggested multiple permutations of this myth, based in part upon rapid changes in gender roles in Western societies (Chodorow 1994, p. 42). Psychogenic explorations have demonstrated the manner in which gender roles are internalized through the “production” of men and women by the kind of parenting that they receive as children (Chodorow 1978, p. 36).

The parents' practical activities of childcare contribute directly to their child's image of God. In Freud's projection theory, the image of God arises out of our experience of an ongoing need for the idealized father of childhood. Freud calls

God a “father substitute...a copy of the father as he is seen and experienced in childhood,” before one's ideal image of one's father is challenged (Freud 1923/2001, p. 46). D. W. Winnicott shifted the psychic weight from father to mother, suggesting that religious belief was created in the same environment of care that transpired between the mother and child (Winnicott 1953/2005, p. 18). Ana-Marie Rizutto agreed that attachment to one's parents is reflected in one's images of God but insisted that Freudian theory must leave room for religious images to develop as one's understanding of one's parents changes (Rizzuto 1979, p. 43). Scholars such as Diane Jonte-Pace and Margaret Hebblethwaite have contributed to the understanding of God that derives from the experience of motherhood, in direct contrast to Freud's emphasis on the Divine Father (Miller-McLemore 2001, p. 453, 466).

It seems that further work must be done, following feminist thought, which would take into account the impact of shifting gender roles upon the psychological health and religious beliefs of modern persons. It has been demonstrated that mothers are spending more time away from the home, with fathers increasing their active care of children, even if not enough to compensate for the absence of the mother (Lamb 2000, p. 339). If mothers are less involved in childcare and fathers somewhat more involved in both childcare and caring for the home, what might be the psychological and religious consequences for the development of children? Recent research points to the fact that children who are raised in more androgynous environments experience “increased cognitive competence, less sex-stereotyped beliefs, and a more internal locus of control” (Lamb 2000, p. 340).

As guarantors of societal order, traditional religions have frequently reinforced gender roles through appeals to the authority of tradition and scriptures. In such mythology, men have been deemed as spiritual, while women seen as carnal, with bodies that need to be managed and controlled by religious authority (Hawthorne 2007, p. 1255). Women have only begun to be allowed

into leadership positions in these religions in the last half of the twentieth century (Hawthorne 2007, p. 1254). In recent decades, “smaller religious bodies with more conservative convictions about the roles of women (such as the Jehovah’s Witnesses, some Reformed churches, Anabaptists, and Mormons) [have been] marked by the greatest inequality between men and women” (Christiano 2000, p. 53). At the same time, in Mexico, religion has been an avenue for freedom from abuse and exploitation, as women have found an opportunity in religious communities to develop identities separate from their alcoholic or abusive husbands (Fortuny Loret De Mola 2000, p. 365). Furthermore, women have frequently been involved from the inception in new religious movements and invited to take quite active roles within them (Hawthorne 2007, p. 1255).

Gender roles are changing in many societies around the world, with women experiencing more freedom and education and men more involved in activities such as childcare and the maintenance of the home. These changes lead to a sense of uncertainty, especially since gender roles reflect deep-seated beliefs about the nature of reality. It has been argued that for men and women, more gender flexibility means an increase in mental health and well-being, as well as a decrease in involvement in fundamentalist religion. At the same time, even in societies where women have increasing rights and responsibilities, they are often faced with “different expectations” than men even in the “same workplace role” (Eagly 2000, p. 448). While fathers are becoming more involved in the care of children, they still often take less responsibility for children than mothers, placing women in the difficult position of juggling responsibilities at work and home (Lamb 2000, p. 339). It is still far from clear how these changes will be adjudicated in a rapidly shifting society.

Genesis

Ingeborg del Rosario

Emmaus Center, Quezon City, Philippines

The book of Genesis is the first book of the Jewish Torah and Christian Scriptures. The word “genesis” is of Greek etymology, meaning origin or birth, and refers to the first verse of the book: “In the beginning, when God created the heavens and the earth. . .” (Genesis 1:1). *The book of Genesis* has 50 chapters, which are generally divided into two sections: primeval history (Genesis 1–11) and the narrative cycles of Abraham, Isaac, Jacob, and Joseph (Genesis 12–50). Genesis 1–11 contains the well-known accounts of the creation story (Genesis 1–2), the fall of Adam and Eve (Genesis 3), the murder of Abel by his brother Cain (Genesis 4), the story of Noah and his ark, the great flood and the divine promise against destruction of every living creature symbolized in the rainbow (Genesis 6–9), and the confusion of languages around the building of the tower of Babel (Genesis 11).

While authorship of the *book of Genesis* was popularly attributed to Moses, biblical scholars recognize it as a redaction from four different sources or traditions. Taken as a whole or a single work of literary unity, the *book of Genesis* encompasses universal themes of creation, the existence of envy and hatred, sin, and strife, violence and evil, wholeness and brokenness, intimacy and isolation, independence and reliance, work and rest, call and response, security and sojourn, conflict and resolution, faith and doubt, hope and despair, the sacrifice of life and the promise of life restored, the destruction and fecundity of generations, and birth and death. The existence of the *book of Genesis* acknowledges the totality of universal experience, the breadth and depth of human reality. It embraces the presence of the Divine who creates and sustains, accompanies and wrestles with, is angered but yet remains constant and faithful to humanity that is formed in godly image and likeness.

The recognition of origins and beginnings in the *book of Genesis*, of creation from chaos, of evil, sin and destruction, and the divine promise of faithfulness, resonates with the deep understanding of human dynamics as shaped and rooted in early personal history and developmental origins. While some therapeutic interventions may focus on the here and now of current thoughts, feelings, and behaviors, the psychoanalytic perspective recognizes the fundamental importance and value of encountering the genesis of the individual and attending to sources of childhood wounding and root experiences of trauma, noting how these contribute to the complexity of the dynamics of the individual’s life experience. The *book of Genesis* focuses primarily on the story of one lineage, recounting the history of first generations and their descendants. A psychodynamic orientation to treatment regards the historical dimension of self with comprehensiveness and depth, considering family of origin influences on the formation and development of the individual. It also acknowledges the reality of trans-generational and intergenerational transmission of trauma, addictions, psychological wounding, and illness. The *book of Genesis* presents the Divine Being neither absent nor distant but present, at times in the space of silence and attuned rest yet always creatively emotionally and relationally engaged in the journey of the spiritual ancestors. The *book of Genesis* also recognizes the interweaving congruence and evolution of the past, present, and future. Movement and progression in psychoanalytic treatment involves often intense and complex processes of working through transference and countertransference in the safety of the holding environment and consistency of frame of the therapeutic relationship. The space of silent yet attuned presence held by the analyst holds and receives communication that is verbal, at times nonverbal, with unsymbolized expressions often reenacted from unconscious or fragmented relational dynamics of the client’s past. Analytic listening is creative and engaged, relationally sensitive, aware of and wrestling with varied nuances and symbols, dreams, fantasy and imagery, the multiple layers of meaning and yet

unformulated experiences, all the while attuned to the being of the client, past unfolding into present, and the limitless play and possibility of the self-becoming in the future.

Genetics of Religiosity

Gilbert Todd Vance
Department of Psychology, Virginia
Commonwealth University, Roanoke, VA, USA

The field of behavior genetics is concerned with identifying genetic and environmental effects, which are sources of individual differences in behaviors and traits. While it may at first appear that religiosity would not be influenced by genes, studies have shown that genetic effects contribute to individual differences in a wide array of traits and behaviors, including social attitudes, personality, vocational interests, IQ, and religiosity. The idea that religiosity is a heritable trait is not a new one. In his 1869 book *Hereditary Genius*, Sir Francis Galton wrote that "... a pious disposition is decidedly hereditary" (Galton 1869/1978, p. 274).

Twin studies, which are one method of observing genetic and environmental effects, take advantage of the fact that monozygotic (MZ) twins share 100% of their genes, while dizygotic (DZ) twins share on average 50% of their segregating genes and are no more alike genetically than non-twin siblings. Therefore, differences in MZ twins provide evidence of environmental effects, whereas differences in DZ twins can result from the effects of genes or the environment. A greater similarity in MZs than DZ twins is generally seen as evidence for a genetic contribution to the observed behavior or trait. In twin studies, the variance observed in a trait can be partitioned into the latent variables' additive genetic effects, common environmental effects, and unique environmental effects. Common environmental effects are those environmental effects that make twins more similar (e.g., a shared upbringing in the same household), while unique environmental effects make twins different from one another (e.g., an experience had by one twin but not the other).

Behavior genetic studies have shown that nearly all psychological traits, including religiosity, are moderately to substantially heritable. A small number of twin studies to date have shown that the degree of observed genetic influence on religiosity is affected by variables such as age, sex, and what aspect of religiosity is being measured. Specifically, at least one twin study has found less genetic influence on religiosity at younger ages and a larger genetic influence on the expression of religiosity in adults. Several twin studies have reported differences in the magnitude of genetic effects on religiosity in females compared to males. Unfortunately, there are not enough twin studies to make definitive conclusions about the relationships between additive genetic effects and age and sex on the expression of religiosity. The degree of genetic influence on the expression of religiosity also appears to be influenced by what specific aspect of religiosity is measured. Studies examining certain single-item measures of religiosity such as religious affiliation (i.e., whether one is Protestant, Catholic, Jewish, Muslim, etc.) have found little or no evidence for genetic effects. On the other hand,

studies that have used multiple items to more broadly measure the religiosity construct have typically found evidence for genetic effects.

These findings must be viewed within the context of the limitations of twin studies. First, very large sample sizes are typically needed to detect common environmental effects, that is, the effect of those experiences that make twins similar, also called the family environment. Most twin studies are underpowered to detect the influence of the family environment. Furthermore, two twins may experience the same environmental event but respond differently to the event. This event would be represented in a twin study as a unique environmental effect, although it was experienced by both twins in the same environment. Despite these limitations, a small number of studies to date suggest that certain aspects of religiosity are influenced by additive genetic effects.

Gimbutas, Marija, and the Goddess

Maureen Murdock

Pacifica Graduate Institute, Carpinteria, CA, USA

The work of Marija Gimbutas has been crucial to the growth of feminist spirituality, feminist religious scholarship, feminist psychology, and the liberating implications that the existence of a goddess tradition can bring to women everywhere. Whatever the reactions to Gimbutas' theories, it is important to acknowledge the larger implications of the idea of an embodied sacred feminine that preceded patriarchy (Fig. 1). As Charlene Spretnak writes:

Gimbutas' work, which was illuminated by her sensitivity to spiritual matters and to sculptures of all eras, has radical implications for the history of both Western religion and Western philosophy. In each of those fields, the early belief systems and

Gimbutas, Marija, and the Goddess, Fig. 1 Owl, Fig. 300, *Language of the Goddess* illustration materials (boxes 252, 253) (Marija Gimbutas collection, copyright OPUS Archives and Research Center, Santa Barbara, CA)

schools are not seen to be *bridge* traditions. That is, the attention in both the Greek “mystery cults” (demeaned as pre-Christian pagan irrationalism) and the pre-Socratic philosophers to unitive dimensions of being and a cosmological wholeness was an attempt to preserve the remnants of Old European wisdom. (Spretnak 1997, pp. 403–404)

Gimbutas’ work helps us entertain the hope that the oppression of patriarchy did not always exist. If a culture did exist in peace approximately 8,000 years ago, prior to the Indo-Europeans, that would certainly be a mythos and psychology for the twenty-first century.

From her excavations in 1973 and 1974, she found temples and sculptures that began to influence her views that the sculptures represented goddesses. She and her associates discovered certain bird head sculptures in the temples and sculptures of pregnant females in the courtyards. There were neither weapons in the graves nor fortifications in the villages. From this, she concluded that this was psychologically and ethically a very different culture from that of the later Indo-Europeans: it was peaceful.

Citing evidence from her excavation of cemeteries, settlements, and the historical records of the continuance of a matrilineal system, from

portrayals in frescoes, and from folklore and similar evidence in the Minoan culture of Crete, Gimbutas concluded that Old Europe was a matrilineal society with a female deity: “Motherhood determined the social structure and religion because religion always reflects social structure. Old Europe was a matrilineal society where the queen was on the top and her brother next to her” (Gimbutas 1990). In *The Gods and Goddesses of Old Europe*, Gimbutas (1974) writes:

The Fertility goddess or Mother Goddess is a more complex image than most people think. She was not only the Mother Goddess who commands fertility, or the Lady of the Beasts who governs the fecundity of animals and all wild nature, or the frightening Mother Terrible, but a composite image with traits accumulated from both the pre-agricultural and agricultural eras. During the latter she became essentially a Goddess of Regeneration, i.e., a Moon Goddess, a product of a sedentary, matrilinear community, encompassing the archetypal unity and multiplicity of feminine nature. She was giver of life and all she promotes fertility, and at the same time she was the wielder of the destructive powers of nature. The feminine nature, like the moon is light as well as dark. (p. 152)

The ancients knew and accepted this cycle of death and rebirth central to goddess spirituality through their physical observation of nature and their seasonal observations of death and regeneration. For example, the Greeks celebrated this in ritual of the Eleusinian Mysteries honoring the return of Persephone each year bearing a single ear of wheat, symbolically reassuring the people that life endures beyond death. At Eleusis, Kore came in answer to the call. She rose from the dead. She appeared. In the Eleusinian Mysteries, the people participated in making the gods come alive and partaking of their gifts (Downing 2010, p. 27). At this time in the twenty-first century, we are also asking Kore, as symbol of the sacred feminine, not only to ascend from the underworld and bring us a symbol of civilization but also to be present for us in the moment of our death, to give it meaning and comfort us.

Through her archeological discoveries and deciphering of the artifacts, Gimbutas reimagined what might have been a culture that was not afraid of death, but instead honored the divine powers that oversaw death and regeneration. Death was

seen as just a transition immediately followed by regeneration. Through the archeological work of Gimbutas, as well as the interpretation of the myth of the Greek Demeter and Persephone by Downing, we are drawn to the Eleusinian Mysteries to remind us that the psychology and spirituality of the sacred feminine continue through the centuries to bring back the life force.

As Marija Gimbutas has said in many interviews, it was her “fate to do this work” because of her family background and the pagan heritage of her country (Gimbutas 1990). She grew up in Lithuania, the last country in Europe to be Christianized – it did not take root until the sixteenth century – and as a child she experienced respect for Mother Earth. Each day she saw people kiss the earth in the morning and say prayers in the evening. She experienced the sacredness of wells, streams, water animals, and trees, all of which were considered to have healing power. Hers was an embodied psychology and spirituality from her earliest memory.

Gimbutas was raised in an atmosphere in which family spirits and the spirits that infused folk art were respected. Her family collected thousands of folk songs and examples of folk art. She studied Indo-Europeans at Harvard University as a visiting scholar and wrote a book on the Bronze Age, but the militaristic patriarchal psychology of the era disturbed her. “I devoted at least 10 years of my career studying Indo-European war gods and weapons and that was too much for me” (Gimbutas 1990). Her life changed when she moved to California and taught at UCLA. This was the beginning of her exploration of the culture that preceded the Indo-Europeans.

Between 1968 and 1980, Gimbutas directed four excavations of Neolithic cultures (7000–2000 BCE) in Southeast Europe in Sitagroi, Greek Macedonia; Anza, Macedonia; Thessaly, Greece; and Manfredonia, Italy. She found thousands of Neolithic artifacts throughout Eastern Europe that spoke of an ancient esthetic different from the material culture of the Bronze Age. Gimbutas determined a “culture existed that was opposite of all that was known to be Indo-European and this led me to coin a new term ‘Old Europe’ in 1968” (Marler 1997, p. 15).

In 1979 Gimbutas organized the first interdisciplinary conference in Dubrovnik, Yugoslavia, to stimulate new research on the radical shift of economic, religious, and social structures that took place between the fifth and third millennia BCE. She became convinced that the art of Old Europe reflected a sophisticated psychological and religious symbolism (Marler 1997, p. 16). She developed an interdisciplinary mode of inquiry she called “archeomythology,” a union of archeology and mythology. She stated, “They cannot be separated because this helps us reconstruct the spirituality of our ancestors” (Gimbutas 1990). She wrote, “interdisciplinary research requires the scholar to view a problem with an entirely different mental focus, which means learning to assemble the data with a goal of seeing all details at once, in situ” (Marler 1997, p. 21). Her work drew from mythology, linguistics, ethnology, folklore, comparative religion, and historical documents.

Her work on the Bronze Age was accepted by archeologists because it had nothing to do with religion or symbolism, but they did not accept her deciphering of a goddess religion because they rejected the notion that a religion could be extrapolated from the artifacts. Yet, she felt it was important to move beyond the limits of scientific materialism alone and use all possible sources to understand the ancestors (Gimbutas 1990).

In an address in 1992 at Interface in Sudbury, Massachusetts, Gimbutas said, “If you say anything about the ritual side of the culture they will say you are cracked. You cannot say anything about the spiritual side of the culture. I don’t care if I will be accepted or not accepted. I care only for the truth. What is the sense of being a scholar if you have to be afraid of some other forces?” (Gimbutas 1992).

Gimbutas’ work in both *The Language of the Goddess* and *The Civilization of the Goddess* has been criticized by archeologists because of her insistence on her interpretation of the figurines as objective evidence of the existence of a goddess religion and on her “lack of precision, and uncorroborated speculations, particularly in view of her earlier esteemed scholarly work” (Long 1996, p. 16). In a 1993 review, in *American*

Anthropologist, Ruth Tringham criticized her for stating there is unequivocal evidence to support her psychological interpretation of goddess symbology and for denying the validity of alternative interpretations. She writes:

Feminist archeological research is based on a celebration of the ambiguity of the archeological record and a plurality of its interpretation, and the subjectivity of the prehistories that are constructed is a part of its discourse. Gimbutas, however, has mystified the process of interpretation and has presented her own conclusions as objective fact (Tringham 1993, p. 197).

On the other hand, Tringham and her colleague, Margaret Conkey, feel that Gimbutas' work reviving goddess religions provides important new perspectives on archeological concerns and challenges the androcentric structure of archeology viewed by many of its professionals. They write:

We have come to see that our enquiry is just as much about key issues in contemporary archeological interpretation as seen through the topic of the Goddess as it is about how the Goddess movement uses archeology. (Conkey and Tringham 1995)

Even though they take issue with many of Gimbutas' assertions, they find the paradigm shift to which she contributed to be valid and forceful (p. 200). Feminist archeologist Lynn Meskell questions Gimbutas' use of an archeological past – convinced that there was an egalitarian culture prior to the Indo-Europeans – to bring about social, psychological, and political change in the twentieth century. But she gives credence to Gimbutas' work as a form of “mythopoetics whereby a cultural identity is constructed or reconstructed” (Long 1996, p. 16). This is the psychological part of Gimbutas' hermeneutic – mythopoetic images are highly psychological – as Jung and Jungians have shown repeatedly.

If we believe, as Jung did, that the whole history of the human race is in some ways always alive in the psyche, we can reclaim images of the sacred feminine. The sacred feminine, or the mother goddess, is an eternal archetype in the human psyche. She has shown herself to us from the earliest times of our civilization in cave

drawings and primitive sculpture and in the great mythologies, and she appears in many guises in our present cultures. She is part of the very fabric of our being. Whether or not an individual grew up in a tradition that honored an image of the sacred feminine, she is part of the collective unconscious accessible to everyone. Jung assured us that nothing which is part of the psyche is ever lost.

It took Gimbutas 30 years of research and deciphering to understand the symbology in excavated places; her background in myth and folklore helped her see the symbology in the sites and figurines she excavated. In *From the Realm of the Ancestors*, Joan Marler (1997) writes, “Joseph Campbell said that if her work had been available earlier he would have written things differently. He neglected goddesses because there was no way to find out more about them” (p. 19).

Gimbutas knew that to reconstruct the social structure of a culture, researchers had to look at cemeteries and study burial rituals to discern how people were buried and with what kind of gifts. In the tombs she excavated there was no hierarchy of males over females; the burial sites showed an equalitarian society. From this, she extrapolated that men and women lived in harmony with each other without one having power over the other. She revolutionized the field by demonstrating that Neolithic settlements of Europe prior to Indo-European influence (around 4400 BCE in Eastern Europe) were radically different than later societies. It is Charlene Spretnak's understanding that this is now accepted by most archeologists (Spretnak 1997, p. 401, 2011).

Villages from 7000 BCE had workshops and a temple proper. In the temple the people prepared pottery for rituals. Gimbutas found in many female graves “cult objects filled with red ochre buried next to houses. These houses were the core houses of the village where the main family lived” (Gimbutas 1992). She found “middle-aged women and girls richly equipped with beads, figurines and a model of the temple.” She speculated that these girls might have been in the line of priestess showing a matrilineal system. In contrast, no cult objects were found in men's graves. Men's graves were “equipped with craft tools,

axes, hoes, trade objects, obsidian for knives, some stone or flint. Clearly men were in trade, which was very important” (Gimbutas 1992). This gender burial difference must have shown the esteem and honor afforded to the feminine.

Finding thousands of female figurines, female-honoring ritual artifacts, and temple models, Gimbutas concluded that women were highly respected in the cultures of Old Europe. The feminine was revered psychologically and spiritually as the giver and nurturer of life. Gimbutas speculated that the female figurines were used in the ritual: some standing on altars waiting for a ritual to begin and others found around bread ovens. “In northern Greece in Thessaly they had rituals before the baking of bread and during the baking of bread. Women made small figurines at the same time they were making the bread; bread was sacred” (Gimbutas 1992).

Gimbutas found 100 pregnant goddess figures in Achilleion in an excavated area little more than 100 m² and more than 200 clay figures in northern Greece. “This site revealed that certain types of female figurines (bird goddess, snake goddess, nurse) were temple or house gods. Others, such as the pregnant goddess, were worshipped in the courtyard at specially prepared platforms with offering pits near bread ovens. These pits were for sacrifices and we found organic remains of plants or grains that were sacrificed. From the 200 figurines found at Achilleion, only two fragmented ones represented a male god, seated on a stool with hands on his knees” (Tringham 1993, p. 22). Gimbutas found a ratio of 98% female goddess figurines to male gods.

Gimbutas did not use the term “matriarchy” but rather “matrilineality” because unlike women in patriarchy, men were not suppressed. Men were very important in society, in trade, architecture, shipbuilding, and crafts. There was no marriage; the mother had a consort but no husband. From the Sumerian and Egyptian myths that were subsequent to the society of Old Europe, we know that this practice existed in many cultures. Until men discovered their biological contribution to the fertilization of new life, women were free to propagate, and their ability to give birth was viewed as sacred.

Gimbutas became convinced that the art of Old Europe reflected a sophisticated religious symbolism, and she categorized the energies of the goddess in terms of life-giving, death-taking, and regeneration. She identified life-giving goddesses such as the bird goddess, snake goddess, and the bull; death-taking goddesses such as the vulture and owl and symbols such as the tomb/womb; and goddesses of transformation such as the egg and the frog. Gimbutas’ find of the thousands of archaic goddess figurines calls for an important hermeneutic shift, because it has serious psychological implications for the interpretations of archaic history and human nature: women have had esteemed roles in history that refute long-distorted patriarchal arguments against female equality with men.

The wide-ranging work of René Girard (1923–) has led to a theory of culture, often called the mimetic theory, that understands the development of religion through the implications of two ideas about human psychology and behavior: *mimetic desire* and *the scapegoat mechanism*. The two are related through the story they tell about the origins of violence and its

significance in the formation of society, including religious institutions.

Mimetic Theory

Girard holds that human desire is fundamentally imitative, or, to use the term he prefers because it suggests the lack of conscious intention to imitate, mimetic. Many, he notes, have treated the importance of imitation in human development, but few have included desire as imitative, and modern individualism, which links desire closely to selfhood, is especially allergic to this claim. Yet beyond the most physiological appetites, and even shaping the way one chooses to satisfy those, desire is formed through imitating the desire of others. Advertisers know that showing an attractive model of desire for an object is more powerful than showing the object itself. In a world of finitude and scarcity, however, mimetic desire leads to conflict and rivalry. The fundamental means for managing the violence that ever threatens to erupt is the scapegoat mechanism.

Girard imagines a heuristic primal scene in which mimetic desire pits all the members of a community against each other. Suddenly, triggered by an essentially random mark that differentiates one member of the community from the rest, the crowd's violent energy is mimetically directed against that one, who is expelled and collectively murdered, as by stoning. In the peaceful but temporary unanimity that results, the community misremembers the victim as a savior who delivered the community from a mysterious crisis, thus concealing memory of the murder beneath the seeds of mythology. Sacrificial rituals emerge in order to repeat the scapegoat mechanism in more controlled ways in order to keep violence in channels. Prohibitions are made in order to deflect desire from the objects most prone to rivalry. Thus, management of mimetic violence through scapegoating accounts for the most basic elements of religion. Legal systems, judicial rituals, and the entire universe of symbolic representation can also be seen to a large extent as outgrowths of concealed and forgotten scapegoating.

Career and Works

After receiving a degree in medieval history and paleography from the Ecole des Chartes, Girard earned a Ph.D. in history at Indiana University in Bloomington in 1950. It was through teaching French literature, however, that he discovered *mimetic desire*. In his first book, *Mensonge romantique et vérité romanesque* (Girard 1961/1965), he argues that the great novels of Cervantes, Stendhal, Flaubert, Dostoevsky, and Proust portray the many permutations that mimetic or mediated desire leads to in triangular relationships of desiring subject, model of desire, and desired object. He makes a basic distinction according to the relative status of subject and model. If they are of different status or operate in different domains, he calls their relationship *external mediation*. In this case, imitation does not lead to conflict because the model and object are out of the subject's reach and the model is an insurmountable obstacle: Don Quixote can imitate Amadis of Gaul without conflict because Amadis is fictional, and Sancho Panza's imitation of Quixote is also external because they are of different social classes. When subject and model are similar in status, Girard calls their mimetic relationship *internal mediation*. Then imitation leads to conflict and rivalry (Girard 1965, pp. 1–10). Subject and model tend to become doubles of each other: "Eventually, the subject will become the model of his model, just as the imitator will become the imitator of his imitator. One is always moving towards more symmetry, and thus always toward more conflict, for symmetry cannot but produce doubles, as I call them at this moment of intense rivalry" (Girard 2007, p. 57). Intense rivalry becomes contagious as others find themselves attracted to the same object of desire. Many literary works merely portray what Girard calls the romantic lie that desires are spontaneous, but the great literary works reflect a conversion on the part of their authors to the insight that desire is mimetic. Girard has returned throughout his career to literary works that he argues disclose the mimetic theory, above all the works of Shakespeare (Girard 1991).

The implications of the mimetic theory for religion begin to emerge in *Violence and the Sacred* (Girard 1977). There Girard looks at evidence of sacrificial ritual and myth and explains their origin through a crisis of mimetic violence resolved through *the scapegoat mechanism*. He finds mythological narratives to have the primary function of both concealing and justifying violence toward scapegoats. At the same time, he explores Greek tragedy as a partial bringing to light of the reality of human violence behind the forms of religion. The myth of Oedipus, for instance, conceals the scapegoating of a victim marked as different by his limp behind a story of persecution justified by the guilt of patricide and incest. The Oedipus tragedies of Sophocles, while maintaining the protagonist's guilt, also begin to make visible the structural symmetries between the communal crises which demand a scapegoat and the familial crises of which Oedipus is accused. Similarly, Euripides' *The Bacchae* shows Dionysus to be the symbol of successful collective violence, but dramatizes this myth coming under suspicion, such that violence, when it is no longer accepted as transcendent, breaks out of its channels and threatens to engulf the community (Girard 1977, pp. 68–142).

Girard's interpretation of Oedipus leads him also to a reappropriation of some of Freud's theories as specific instances of more general patterns. The Oedipus complex is not unique but rather a basic example of mimetic rivalry, and patricide is an instance of scapegoating (Girard 1977, pp. 169–192, 208–209).

In his pivotal *Things Hidden Since the Foundation of the World* (Girard 1987a), made more accessible by its interview format, Girard summarizes and extends his previous work into a full theory of human origins, including religion, before offering a reading of the Judeo-Christian scriptures as an unveiling of the mimetic mechanisms behind mythology. While biblical stories share much in common with other myths, they are decisively distinguished by telling these stories from the perspective of innocent victims rather than their persecutors. Cain and Abel is a typical story of founding violence, like that of

Romulus and Remus, yet the victim's blood, rather than being condemned as guilty or concealed by divinization, cries out from the ground (Girard 1987a, pp. 144–149). The story of Joseph, while it has many similarities to that of Oedipus, shows him to be the innocent victim of his brothers and again of Potiphar's wife, and his story ends with staging a potential scapegoating of Benjamin in order instead to reconcile with his brothers (Girard 1987a, pp. 149–154, 2004, pp. 107–113). The Ten Commandments, which resemble other religious prohibitions, end with one that forbids desire for a neighbor's possessions and thus implies the mimetic origins of the violence proscribed in those that come before (Girard 2001, pp. 7–18). Above all, in what he calls this anthropological rather than theological interpretation of the Bible, the Gospels provide fullest possible exposure of the dynamics of mimetic desire and scapegoating. Yet, he argues, historical Christianity has often misunderstood this part of its revelation, in particular by reading the atonement as a sacrifice needed to appease the wrath of God (Girard 1987a, pp. 158–262).

Much of Girard's later work has added to his anthropological interpretation of the Bible in contrast to myth. He reads the book of Job as primarily a rehabilitation of a potential scapegoat, yet framed by a mythologizing preface about Satan (Girard 1987b). In *I See Satan Fall Like Lightning*, he interprets Christ's discussions of Satan and miracles of casting out demons as symbolic of intense mimetic rivalry and victimage and explicates the closely related language of scandal or stumbling block as identifying how a model of desire becomes an obstacle and a focus of both fascination and hatred (Girard 2001, pp. 32–46). In Girard's reading of the story of the woman caught in adultery (John 8), to take another example, Jesus writes in the dust in order to avoid the eye contact that would allow her accusers to project onto him a mirror of their own aggression, brings to recognition the problem of the first stone that could become the model of those that would mimetically follow, and begins instead a contagion of nonviolence (Girard 2001, pp. 54–58). In *The Scapegoat*, Girard introduces the idea of *stereotypes of persecution* used to justify collective

violence, such as that against the Jews in the late Middle Ages, which he argues are transmitted by myths and provide a key to demystifying them under the guidance of the biblical revelation (Girard 1986). In *Sacrifice*, he finds traces of an unveiling of the mimetic origins of sacrificial ritual also in the Hindu Vedas (Girard 2011).

After teaching at various universities in the United States, Girard finished his career at Stanford University, where he retired in 1995. He was elected to the French Academy, the highest honor for French intellectuals, in 2005.

Reception and Influence

While Girard's reception among biblical scholars and theologians has been controversial, it is perhaps here that he has gained the most influence, at least in the English-speaking world. A practicing Roman Catholic, Girard has refrained from writing as a theologian and left open questions about the degree to which his anthropological interpretations of the Bible are compatible with theological interpretations (Kirwan 2009). He is acknowledged as a source for much recent work on atonement theology in particular (e.g., Heim 2006). The most prolific and widely read theologian working under Girard's direct influence is James Alison (<http://www.jamesalison.co.uk/>).

While Girard's work depends primarily on the interpretation of texts, he has invited collaboration with empirical science and claims scientific reliability for his theory. Jean-Michel Oughourlian, one of his interlocutors in *Things Hidden*, has extended the mimetic theory to major issues in psychotherapy (Oughourlian 1991) and applied it to marital counseling by way of a mimetic reading of the opening chapters of Genesis (Oughourlian 2010). The discovery of mirror neurons, which establishes a physiological basis for mimetic desire, has stimulated attempts to combine mimetic theory with the results of psychological and sociological studies of imitation (Garrels 2011).

An international organization for those interested in pursuing the implications of his work both in academia and beyond, the Colloquium

on Violence and Religion, was founded in 1990, and a foundation dedicated to furthering the mimetic theory, *Imitatio*, in 2007.

Glossolalia

Kenneth L. Nolen

Salinas Valley Memorial Healthcare System,
Salinas, CA, USA

Glossolalia is derived from two New Testament Greek words: *glossai* meaning “tongues” or “languages” and *lalien*, “to speak.” Glossolalia or speaking in tongues has most often been identified with Pentecostal and Charismatic faith traditions. Glossolalia is usually but not exclusively a religious phenomenon. Glossolalia consists of words and utterances made by an individual that resembles a language unknown to the person speaking. Individuals practice glossolalia in private or public worship settings in which the speaker may also be in an excited psychological state or may enter into a blissful and peaceful meditative or prayerlike stance. Groups within Pentecostal and Charismatic movements agree that glossolalia is a manifestation or gift of the Holy Spirit, but disagree as to whether or not it is the certifying initial evidence of baptism in the Holy Spirit.

Pentecostals and Charismatics believe that through the influence and direction of the Holy Spirit, they are speaking a spontaneous and unpremeditated heavenly language praising God or giving a prophetic word. They teach that glossolalia or speaking in tongues is a distinctive gift as a result of the baptism in the Holy Spirit. What they do not agreed upon is whether glossolalia is

the initial evidence proving baptism in the Holy Spirit or if it is a distinctive and desirable gift but that other manifestations may indicate that a person has been baptized in the Holy Spirit.

Glossolalia and the doctrine of the baptism in the Holy Spirit are based on events occurring on Pentecost as recorded in Acts 2:1–4. This event was predicted by Jesus to the assembled men and women in the Upper Room (Luke 24:49) and again just before he ascended into heaven (Acts 1:4–5 and Acts 1:8). When the day of Pentecost came, the disciples were meeting together when the foretold event occurred. The author of Acts states that “Suddenly a sound like the blowing of a violent wind came from heaven and filled the whole house where they were sitting. They saw what seemed to be tongues of fire that separated and came to rest on each of them. All of them were filled with the Holy Spirit and began to speak in other tongues as the Spirit enabled them.” (Acts 2:2–4).

Glossolalia and the charismata, spiritual gifts, of the Holy Spirit were paramount in the birth and growth of the fledgling church during the first and second centuries. By the time of Origen in the third century and Augustine in the late fourth and fifth, it is clear that church leaders considered the charismata as attributes only for the early church. Augustine established the belief held by many today that the charismata, including glossolalia, ended with the deaths of the original apostles.

Notwithstanding Augustine’s belief, there is evidence of the continuation of glossolalia and the charismata of the Holy Spirit throughout the more than 2000 years of Christian Church history. However, the start of the modern Pentecostal movement is generally credited to Charles Fox Parham and the students of Bethel Bible College in Topeka, Kansas, in the early 1900s. From Topeka across the United States including the Azusa Street revival held by William Seymour, a new Pentecostal revival had begun.

The most significant tenet of faith derived from the revival at Topeka and reaffirmed at Azusa was the verbalization that glossolalia or speaking in tongues was the biblical initial evidence of Holy Spirit baptism. This monumental

doctrine offered an objective criterion for the seeker of the baptism in the Holy Spirit and others to determine whether that event had occurred or not. This doctrine shaped the modern Pentecostal movement as it spread across denominational lines, establishing new denominations and nondenominational faith groups until it is now the largest and fastest growing Christian religious movement worldwide.

Commentary

Glossolalia is not limited to Christianity or to religion. Ecstatic utterances similar to those used in the first century church at Corinth were also found at the oracle of Delphi, a shrine of the Greek god Apollo. Some consider the chants of voodoo witch doctors, African animists, and the Tibetan Buddhist monks; the prayers of Hindu holy men; and the basic primeval sounds produced by others in their religious setting as glossolalia. Many of these worshipers make sounds and utterances that approximate purported languages found in the glossolalia of Pentecostal and Charismatic worship services. The difference is source and content. Pentecostals and Charismatics believe that any glossolalia not originating from the Holy Spirit and not worshiping God and Jesus is a demonic counterfeit.

Glossolalia can occur in some known psychiatric conditions such as schizophrenia and manic-depressive psychosis or as the consequence of neurological disorders. Earlier psychological studies viewed glossolalia as a by-product of an unhealthy mind or a personality disorder. Some researchers viewed glossolalia as hysteria, mass hypnosis, regression, an altered state of consciousness, or a learned behavior. Recent psychological studies have successfully challenged these views and have shown that glossolalia is a legitimate religious activity and not psychopathological. Generally, Pentecostals who speak in tongues have a healthy and normal personality, and speaking in tongues may be conducive to good physical as well as mental health. Some practitioners claim that glossolalia may relieve psychopathology. However, a major study of religious glossolalia

concluded that there is no consistent evidence supporting curative effects.

Linguists in recent years have made studies of glossolalia with some claiming that Pentecostal glossolalias are languages that can be understood by anyone who knows the language. Other linguists maintain that the sounds and utterances of glossolalia are actually unrelated syllables of the speakers' own known language and are not a true language. Early Pentecostals believed that glossolalia was given to the church for the purpose of world evangelism. Many of them left for foreign mission fields fully expecting the Holy Spirit supernaturally to give them the language of the native peoples. This initial expectation and the resulting experience was a bitter disappointment to aspiring missionaries who did not want to invest years in language study. Most Pentecostals have come to the realization that it is not God's divine purpose to bestow languages for missionary work and have had to reevaluate the biblical understanding of glossolalia. Glossolalia is not a human language and cannot be interpreted or studied as a human language. Glossolalia is a language of faith. The person speaking in tongues is speaking in an unknown language from the soul or spirit directly to God.

Gnosticism

Marta Green
New York, NY, USA
Mercury Pier Publishing, Hong Kong Special Administrative Region of the People's Republic of China, North Point, Hong Kong

Origin of Gnosticism

The word “Gnosticism” derives from the word *gnosis*, the Greek word for knowledge. Gnosticism has its roots in pre-Christian Jewish and Hellenistic pagan thought that emerged around the Mediterranean in the first centuries CE. Christian Gnosticism is based on the belief in secret knowledge as a means to salvation, not the death and resurrection of Jesus. This belief made Christian Gnostics heretical in the eyes of the early church.

When the Gnostics spoke of knowledge, it was specifically the knowledge of God to which they were referring. They refer not to an objective

knowledge of God, but a profoundly subjective knowledge in which the knower is radically transformed both by God and by the very experience of knowing. German philosopher Hans Jonas (1903–1993) wrote one of the first texts on Gnosticism, *The Gnostic Religion* (1958), written before he had access to the Nag Hammadi scrolls. He writes:

“Knowledge” is not just theoretical information about certain things, but is itself, a modification of the human condition, charged with performing a function in the bringing about of salvation... the ultimate “object” of gnosis is God: its event in the soul transforms the knower himself by making him a partaker in the divine existence. Thus in the more radical systems like Valentinian the “knowledge” is not only an instrument of salvation but itself the very form in which is the goal of salvation, i.e., ultimate perfection, is possessed (Jonas 2001, p. 35).

Theology of Gnosticism

The main theological tenet of Gnostic thought is the radical separation of the all-good, all-light transcendent God from the dark, evil world. The transcendent God did not create the world, nor intervene in it. The cosmos was instead made and governed by rulers or Archons who ruled humans, body and soul, entrapping them in natural passions so that they would never escape their power by returning to the Transcendent God. Archons were often named by the Hebrew names for God: Iao, Sabaoth, Adonai, Elohim, El Shaddai. The name of their leader was the Demiurge, who was “often painted in the distorted features of the Old Testament God.” The name for the tyrannical world-rule is *heimarmene* (Jonas 2001, pp. 44–45).

Such a theology could not help but lead to a radical dualism. Though the Archons ruled humans, body and soul, making them unconscious of their true nature, there was the chance that humans could be enlivened through a *pneuma* or spark from the Transcendent God. The spark could not leave the Transcendent God directly because this God does not intervene in human life, but the Gnostics believed there was a messenger able to leave the Transcendent

and plant a spark in the human soul. This is a Being of knowledge and light, in existence even before the beginning of creation that is able to enter the world as a messenger, outwit the Archons, and bring knowledge to slumbering humanity. We see references to this concept in the personification of “Sophia” (Proverbs 3:13–20) in the Hebrew Scriptures, the hymn of “The Word” in the prolog to the Gospel of John (John 1:1–18), and, of course, in the person of Jesus of Nazareth. When humanity receives this knowledge, then they are able at death to escape the powers of the Archons and to rise to the Transcendent God (Jonas 2001, p. 44).

As Gnosticism was a theology of emphasizing how the evil gods governing this world separate humans from their true home with the Transcendent God, much of Gnostic literature was concerned with the question of how humans got separated from the Transcendent God in the first place. One of the best-known pieces of Gnostic literature is the *Hymn of the Pearl* which describes the journey of the soul as a royal child’s journey from heaven to retrieve a pearl in the bottom of the sea. The pearl is round and thus whole, luminous and created by layering over an irritant, thus the perfect symbol of the self. When the child retrieves the pearl, he returns to his true home in the sky where he is lauded and given his rightful place.

The Gospel of Thomas

For centuries Gnostic literature was known mostly through early Christian polemics against it, but in 1945, 12 jars containing scrolls were found in a cave in Egypt. These texts have come to be called the *Nag Hammadi Library*, written about 350–400 CE and probably hidden in the cave at a time of persecution. The library contains a number of theological texts, alternative gospels, and poetry such as “Thunder Perfect Mind.” The best-known writing from the Library is the Gospel of Thomas, a gospel purportedly written by Jesus’ twin brother. There is some debate if this is actually a Gnostic text, because it contains no cosmology, which dominates many Gnostic writing, but

the Gospel of Thomas does proclaim salvation by knowledge and never mentions the passion and death of Jesus. The gospel includes much material found in the synoptic gospels, plus additional material, often about knowledge. For example: #5 “Jesus said, Know what is in front of your face, and what is hidden from you will be disclosed to you. For there is nothing hidden that will not be revealed.” Probably the best-known passage from the gospel: #70 “Jesus said, ‘If you bring forth what is within you, what you have will save you. If you do not have what is within you, what you do not have within you [will] kill you’” (Robinson 1990).

Gnosticism and Psychotherapy

Gnosticism is no longer an active religion, but the search for the secret knowledge that will transform informs studies in philosophy, theology, and psychology. Gnosticism holds in common with psychotherapy the belief that meaning is internal, that words of themselves can alter the human condition, and that secret knowledge, be it spiritual or psychoanalytic, transforms. Both Gnosticism and psychotherapy undertake the inner journey to find the self.

Gnosticism and Psychoanalysis

Matthew Dillon

Religious Studies: Gnosticism, Esotericism, Mysticism, Rice University, Houston, TX, USA

Introduction

Gnosticism and psychoanalysis, more so than many within this Encyclopedia, requires a multifarious entry. Attention must be given to the ancient sources of modern terminology, the rise of psychoanalytic – particularly Jungian – interpretations of Gnostic texts by psychoanalysts, the adoption of psychological approaches by scholars of Gnosticism themselves, and the blending of psychoanalytic approaches to gnosis and Gnostic religion in contemporary forms of Gnosticism itself.

Gnosis, Gnostikoi, and Gnosticism

In ancient Greek, *gnosis* referred to a form of knowing akin to a personal acquaintance or relationship in contradistinction to the more common term for knowledge of facts, *episteme* (Filoramo 1993; Liddell and Scott 1889; Pearson 2007). Gnosis, and its opposition to *pistis*, faith, was a dominant theme in the religious discourses of the first centuries CE, with *gnosis* of divine secrets seen as a possession of those with special religious knowledge – the Gnostics, or *gnostikoi* in the Greek. These *gnostikoi* claimed that the revelation of gnosis was a personally transformative

experience, most often through the transcendence of materiality (*hyle*) and the soul (*psyche*) to the realm of pure spirit (*pneuma*) (Culianu 1983). As such, adoption of doctrines of gnosis within the psychological realm carries a significant linguistic and conceptual disconnect despite the notable resonances between soteriology and therapeutic healing.

Although no ancient linguistic counterparts exist for the neologism Gnosticism, a term first used by Henry More in the context of interdenominational polemics in the seventeenth century, at the Congress on the Origins of Gnosticism Messina in 1966, the term was adopted to represent a set of movements within the Ancient Near East in the second and third centuries CE that claimed access to saving gnosis (King 2003; Rudolph 1977). This umbrella term now refers primarily to movements such as the Naassenes, Ophites, Simonians, Valentinians, Sethians, Carpocratians, Manichaeans, and Mandaeans, as well as singular figures such as Basilides of Alexandria or Simon Magus. Both the Manichaeans, who eventually dispersed as far as China and survived through the seventeenth century, and the Mandaeans, who still exist today in both Iraq and diaspora factions in the United States, remained in existence long after Late Antiquity. Moreover, a number of Gnostic churches have arisen in the last two centuries that claim an unbroken succession going back to these original Gnostics or a doctrine of saving gnosis akin to them (Hoeller 2002; Puma 2011; Smith 1995).

Carl Jung and Gnosticism

Carl Jung is the first psychologist to conduct a significant study of the ancient Gnostic literature, and his influential interpretations have guided most later psychoanalytic and religious approaches to Gnosticism. Although there are no references to Gnostic literature in *Wandlungen und Symbole der Libido*, his first foray into a psychoanalytic interpretation of religion and mythology published by 1912, he did begin to carefully read the Gnostics available in Patristic

sources by 1915 (Jung 2009). His paranormally inspired *Septem Sermones ad Mortuos*, or “Seven Sermons” given pseudepigraphically by Basilides of Alexandria, as well as sections of the *Liber Secundus* of the recently published *Red Book*, exhibits this initial acquaintance with these Gnostic writings. Additionally, secondary literature by early scholars of Gnosticism such as Albrecht Dieterich, Charles King, and G. R. S. Meade was available in his personal library at this time (Jung 2009; Noll 1994).

It is not until significantly later in his life that Jung would conduct a formal, systematic reading of Gnostic texts. In *Aion*, specifically “Gnostic Symbols of the Self,” Jung offers an interpretation of various Gnostic writings from the Patristics, particularly the “Naassene sermon” (Jung 1951/1978). Jung interprets the immaterial Godhead as the unconscious in its primordial form, while various key symbols of the Gnostic cosmology – Christ, the Son, Primordial Man, Anthropos, and God – all represent his psychological doctrine of the Self. Conversely, the Demiurge, as well as the matter which he creates and presides over, comes to represent the creation of the ego followed by the latter’s ignorance of the collective unconscious. The common appearance of the higher God to the Demiurge, then, comes to represent the call of the ego to reengagement with the unconscious contents in order to form the Self (Jung 1951/1978). Elsewhere, Gnostic tales of the Godhead’s retrieval of the divine sparks in matter are read as the ego’s engagement with the collective unconscious towards individuation (Jung 1955, 1968). Jung also read the exile of the spirit in matter as a prefiguration of the psychoanalytic doctrine of projection (Jung 1968).

Yet Jung did not think that the Gnostics of old had a doctrine of the unconscious or archetypes as they exist in his psychology, but rather argued that these writings projected the individuation process in terms of a drama of redemption as enacted with reified metaphysical concepts (Jung 1971). As such, Jung supposed that these Gnostics had practiced something similar to his own practice of active imagination that had furnished the visionary narratives he captured in *The Red Book* (Jung 1968, 2009). Much as he did with alchemy, Jung

approached the Gnostic writings as a valuable comparative material in proving and amplifying his doctrine of the collective unconscious (Jung 1951/1978, 1963b).

Psychologists Interpreting Gnostic Texts

Most psychological approaches to Gnostic texts have followed the Jungian hermeneutic outlined above. After the translation and publication of the Nag Hammadi Library, major figures in the Jungian community such as Marie-Louise von Franz, Murray Stein, and June Singer each published such interpretations of texts Jung would not have had access to, such as the *Apocryphon of John*. Singer's work expanded the Jungian hermeneutic in offering feminist and postmodern psychoanalytic readings of *The Exegesis on the Soul* and *The Gospel of Philip*, although her works were generally written less for academic than popular audiences (Singer 1990, 1992).

Robert Segal has pointed to the shortcomings of this hermeneutic in approaching Gnostic texts. Segal has specifically questioned how the equation of individuation and Gnostic soteriology can be accurate when the primary motivation behind many of these myths is to disengage from materiality and return to the Pleroma. Read in Jungian terms, this regression of the ego to the unconscious would be seen as inflation. He has suggested that Jung's misreading of Gnostic texts could perhaps be attributable to Jung's tendency to read these texts as related both historically and motivationally to alchemical texts, where readings suggestive of unconscious and conscious integration have better support (Segal 1992, 1995).

Scholars of Gnosticism Using Psychological Hermeneutic

Jung's close associate Gilles Quispel was one of the foremost scholars of Gnosticism in the twentieth century. Having met at the famed Erano conferences after Quispel sent Jung his study of

the second-century Alexandrian Gnostic Valentinus, Quispel eventually enlisted Jung in 1953 to help purchase Codex I (later known as the "Jung Codex") of the Nag Hammadi Library in order to ensure that the other 12 codices would be released for serious study by the Egyptian government (Quispel 1978). Throughout his career, Quispel would write appreciatively of the perspicacity of the Jungian hermeneutic in approaching Gnostic texts, albeit with the important caveat that the reading not be seen as psychologically reductionistic (Quispel 1972). Insofar as Jungian psychology is one of the personal, transformative experiences within the psyche – whatever ontological ground that it may point to – Quispel sees it as capable of elucidating Basilidean and Valentinian gnosis, as belonging with a tradition of western gnosis that comprises much of what later fell under the umbrella of western esotericism (Quispel 1949, 1968, 1972, 1978).

Jungian readings fell out of fashion within the scholarly community by the 1980s. Since then, psychological approaches to the Gnostic texts have been performed through various appropriations of cognitive psychology. Ioan Couliano, the Romanian historian of religions, utilized the theories of Howard Gardner as well as early theorists of artificial intelligence to support his theoretical position of historical morphodynamics. Relying heavily on Levi-Strauss's Structuralism, Couliano posited that the human mind could process an "ideal object," such as dualism, in only a limited number of ways due to our cognitive limitations, and that the interpretations that result from acceptance of a such an ideal object lead to predictable, if elaborate, systems such as Gnosticism (Couliano 1992). Gnostic mythology is then read as the result of human minds cognitively engaging Genesis 1–3 having accepted the ideal object of dualism.

More recently, scholars of Gnosticism have looked to cognitive linguistics in order to more fully explicate Gnostic myths and the world in which these figures participated. Hugo Lundhaug has approached the images of birth and rebirth in *Exegesis on the Soul* and *The Gospel of Philip* from the perspective of "cognitive poetics,"

essentially a reading through the twin lenses of cognitive blending and conceptual metaphor theory. April DeConick has also turned to cognitive linguistics, particularly conceptual blending and frame theory, in the creation of her Network Criticism method. Critiquing earlier models of Historical Criticism for ignoring issues of embodiment and attempting to construct linear descriptions of how sources came to be in particular texts, DeConick takes biblical and Gnostic texts as cultural productions that serve as capital within in a conversation cloud, shifting the historical emphasis from historical sources in a text to the web of interacting interpretations both within the text and of the text in the larger cloud. In practice, this method attempts to situate groups who have evaded clear understanding via Historical Criticism, such as the Naassenes and the Ophites, within a particular historical-temporal conversation (DeConick [forthcoming](#)).

individuation as coterminous with Gnostic soteriology, with the individual ego striving to regain its authenticity from alienation through recognition of its true self – the spark – and the withdrawal of projections leading to a relationship with the collective unconscious, or Pleroma. However, Hoeller departs from the Jungian psychologists above in arguing that Jung was not denying the metaphysical potential of his psychology, but rather than he persisted in being open to the possibility that the psychology could open up into metaphysics (Hoeller [1982](#), [2002](#)). Hoeller has argued that Jung is the latest “prophet” in the tradition of Gnosis, a stream flowing from historical Gnosticism through figures such as Ficino, Blake, and Helena Blavatsky (Hoeller [1982](#), [2002](#)). As such, modern Gnosticism can be seen as appropriating psychology as religion in much the same way as modern New Age and Metaphysical religions (Hanegraaff [1998](#); Jonte-Pace and Parsons [2001](#)).

Modern Gnostics and Psychoanalysis

Contemporary Gnosticism and Jungian psychology are common bedfellows, illustrated most clearly in the *Ecclesia Gnostica* as presided over by Bishop Stephan A. Hoeller. Born in Hungary in 1931, Hoeller fled the country during the Nazi occupation of World War II, immigrating and studying over the continent while getting his Ph.D. in Comparative Religions and training for the Catholic Priesthood. Hoeller encountered a private edition of Jung’s *Septem Sermones ad Mortuos* as a young Catholic priest, an event that kindled a lifelong passion for Jungian psychology. In 1958, Hoeller became Bishop of the Pre-Nicene Gnostic Church in Los Angeles, subsequently renamed *Ecclesia Gnostica*, where he presides to the present day.

Hoeller’s presentation of Gnosticism is almost identical with those of Jung himself, and several of his books, as well as lecture series, have been dedicated to explicating the Nag Hammadi texts from a Jungian perspective (Hoeller [1982](#), [1989](#), [2002](#)). Hoeller presents Jung’s doctrine of

God

David M. Moss III
Atlanta, GA, USA

The word “god” is an Anglo-Saxon term of Teutonic origin meaning “one who is greeted” as the object of religious worship. The conception named God is an analogical expression pointing directly toward incomprehensible mystery. That mystery is to be greeted as the inconceivable ultimate Being who ignites all life. God is the creative source of existence within and beyond time and space. God is self-sufficient, absolute spirit, eternally transcending, and pervading every dimension of reality.

Philosophy

In Western philosophy there are three classical arguments for the existence of God. (1) The Teleological Argument asserts that the universe exhibits both design and purpose. Objects, persons, and events have an aim or goal. Their relationship is fashioned by God who guides and directs them toward the fulfillment of their natural directions. That is to say, God exists as the purposive cosmic designer of all that has been, is, and will be. (2) The Cosmological Argument contends that the universe could not have come into existence by itself. There is a first cause of all existence, a cause that is uncaused. This primary cause must be God because nothing but God could exist without being caused. (3) The Ontological Argument insists that God is the most perfect being possible, and since that which is perfect but lacking existence is less than perfection that does exist, God exists. Barrels of medieval ink have saturated countless volumes on each of these arguments – many in refutation. In general, modern philosophy believes that the existence of God cannot be proven or rationally demonstrated.

Anthropology

The discipline of anthropology studies religion as belief in a supernatural or nonempirical force and the action patterns related to that belief. God, as an object of religious worship, is evolutionary. Anthropology, with the support of archeology, suggests that the basic conception of God lies in the awareness of numinous which developed into primitive tribal animisms and sympathetic magic. These tribal beliefs and practices became more articulate as polytheisms developed. The Graeco-Roman pantheon is a prime illustration of the view that there are many gods affecting human history. Henotheism is a species of polytheism exemplified by ancient Judaism. It is the belief in one God in the presence of many others. The worship of such a god is monolatry.

Monotheism developed as a reaction to polytheism. For instance, classical Jewish monotheism developed out of henotheism as did its derivatives, Christianity and Islam. The foundation of Islam is a conviction that there is no God but Allah and Muhammad is his prophet. Muhammad drew upon Jewish and Christian resources in the design of a monotheistic belief system for Arabia to spread worldwide. He differed radically from Jesus the Nazarene in that Muhammad never claimed to be God or expected that he would be resurrected by Allah. On the one hand, Islam claims Muhammad, though not divine himself, was divinely inspired more than anyone in human history. He was also the driving force of jihad (an internal effort of reform) and, most importantly, Allah’s secretary for the Koran. On the other hand, Christianity claims that the God of the Jews was physically articulated in the historical Jesus whose resurrected personality or Holy Spirit became a Real Presence directing people toward the mindfulness of love, as well as the value of collective worship in the assembly called church – the metaphorical house of God. Conceptually, this monotheistic Trinity was strongly enabled by Greek philosophy which clarified “substance,” or *ousia*, so that a model of three persons of the same property or nature reveals God, like expressions or manifestations of water

in liquid, ice, and steam. This unity of Three-in-One and the One-in-Three is eternal and immutable. Christianity claims that Jesus' relationship with God and the Holy Spirit is a monotheism of metaphysical unity. God became a specific man who lived through and beyond death, leaving his Holy Ghost or personality to guide disciples into the mindset of God's will or kingdom.

Psychology

Philosophy and anthropology are components of psychology, a science that concentrates on the mind and behavior of living beings. As a perspective and a discipline, psychology centers on the mental and behavioral effects of believing in God. In this instance, it is the conceptual reaction or belief that matters and not the reality or nonexistence of a deity. For Freud, the founder of modern psychology, belief in God could be explained via problematic relationships with father figures. His argument rests on an illusionary model of God growing out of the Oedipus complex. Many depth psychologists disagreed with this reductionism. In general, psychiatry, psychoanalysis, and psychology now agree that God concepts develop out of a matrix of intrapsychic and interpersonal components. As a result, most social sciences approach the subject of God with less anthropomorphism than ever before. This is most evident in the growth of spirituality as a dimension of strength and comfort embraced by modern health-care services and contemporary pastoral theology.

Theology

The current emphasis on spirituality is not a unique insight of postmodernism. In many respects it is a consequence of God being the object of intractable religious customs and symbols. When religion attempts to define God literally, faith is subordinated to reason. Anthropomorphism and idolatry are common results, as well as descriptions of God that may or may not be logical. God, in such instances, is usually portrayed as a noun who sustains mankind in the face of threats and tragedies. This mindset

commonly fails to recognize God as a verb revealed in ethical mindfulness and humane behavior.

Theology, as a discipline, seeks to articulate dynamics, properties, characteristics, or attributes of God that personally involve human beings whether they know it or not. However, these divine traits are not definitive. To acknowledge God as the "creator," "redeemer," and "sustainer" is a descriptive interpretation but not a definition in any complete sense, for God cannot be comprehended. Yet there are characteristics of God that are absolutely central to traditional theology.

For a theist, the three essential characteristics or properties of God are (1) omnipotence or God's infinite power to create, conserve, and destroy anything, anywhere, at any time; (2) omniscience or the knowledge of all that is possible to know; and (3) omnipresence or being everywhere without spatial necessity. These absolute properties, along with God's timelessness and perfect freedom, naturally raise questions around events of tragedy, illness, and death. Such queries are the focus of theodicy, a dimension of Natural Theology that attempts to justify God's benevolence and justice in a world where misery and evil exist as constant challenges to human development and moral growth.

The fundamental component of theodicy is Providence, a belief system that confronts the tension between ideal good and the ever-present reality of evil. God, in this sense, can be recognized as evil turned against itself. Such recognition offers faith that mankind is not a natural accident in a purposeless universe. For God is to be greeted as the essential vitality of all existence—physically, psychologically, and spiritually.

God Beyond God

Louis Hoffman¹ and Juanita Ratner²

¹Saybrook University, Oakland, CA, USA

²LPC, Denver, CO, USA

God beyond God, or the God above God, as relevant for psychology emerged in the writings of Paul Tillich (1952), although similar conceptions can also be seen in the writings of Meister Eckhart (1981) and other religious writers that predated Tillich. While Eckhart was more influential in Christian theology and mysticism, Tillich's influence crossed over to psychology, including his idea of the God beyond God. In particular, Tillich (1952) is referring to "The God above the God of theism" (p. 187). The God beyond God cannot be contained in religion, theism, language, or human conception. It refers to a recognition that all conceptions of God, whether they be personal, cultural, theological, or psychological, are attempts to put what is beyond language into a human construction. This endeavor is always limited, thereby necessitating some distortion. Tillich (1951) states, "A consequence of the method used in apologetic theology is that the concept of revelation is approached from 'below,' from man in the situation of revelation, and not from 'above,' from the divine ground of revelation" (p. 155). This differentiation between the God contained in human conception and language and the God beyond language is fundamental to Tillich's theology and has important psychological implications.

Tillich also described the God above God as ultimate being, being-itself, or the ground of being. Rollo May (1983) notes, "Being-itself describes an encounter with reality below the subject-object split. That is the level where we have to seek reality, and with reality we find meaning" (p. 97). This approach has been influential on existential-humanistic psychotherapy with regard to its understanding of the nature of being as well as how existential-humanistic psychology approaches religious and spiritual issues.

The God Beyond God in Theology

Meister Eckhart stands out as an early Christian theologian to address the mystery of God beyond God, or a God that is beyond *esse* or *intelligere*, beyond existence or understanding. Eckhart attempted to address a paradoxical reality concerning the nature of God and of human being, namely, that the innermost ground of the soul is one with that ground of God that is "God Beyond God." In sermon 5b, Eckhart proclaimed, "Here God's ground is my ground, and my ground is God's ground. Here I live from what is my own as God lives from what is his own" (p. 183). In his sermon 52, "Blessed are the Poor," he said,

Therefore, I pray to God that he may make me free of 'God,' for my real being is above God if we take 'God' to be the beginning of created things. For in the same being of God where god is above being and above distinction, there I myself was. . . (p. 202)

Other Christian writers have also spoke of similar conceptions to God beyond God. For example, Thomas Merton (1962/2007) recognized that abstractions utilized to try to understand God or the nature of God were different from the God being described:

The living God, the God who is God and not a philosopher's abstraction, lies infinitely beyond the reach of anything our eyes can see or our minds can understand. No matter what perfection you predicate of Him, you have to add that your concept is only a pale analogy of the perfection that is in God, and that he is not literally what you conceive by that term. (p. 131)

Similarly, Spong (2005) expands this argument to the notion of the Word of God, noting that this is

built upon what he believes is the problematic assumption that “God is a very humanlike being who has the ability to speak to a particular people in a language that they understand” (p. 15). However, not recognizing that the Bible is constructed in human language, with all the limitations inherent therein, is problematic and distorts a more accurate understanding of God. The best understanding of God is, in essence, rooted in the recognition that any conception or understanding of God is limited and imperfect.

Conceptions of the G-d beyond G-d also exist in Judaism, particularly Jewish mysticism and the Kabbalah (Matt 1996). For example, Schneerson (1989/2010) notes that “G-d is even beyond anything we can abstract” (p. 215). According to Schneerson, some aspects of “God’s infinite light” will never be revealed in earthly revelation. Thus, some aspects of God are beyond and are not revealed to humans, and part of what is revealed is beyond human conception.

God Beyond God, Symbolism, and Idolatry

Tillich (1957) illustrates how religious symbols frequently become idols. Symbols, by their nature, point to something beyond themselves. When individuals stop at the symbol, instead of what the symbol is pointing toward, they fall short of engaging the entity represented by the symbol. In religious terms, when the symbol is worshipped instead of what the symbol is pointing toward, this is a form of idolatry. Peter Gomes (1996), drawing on Tillich’s conceptions on symbolism, states,

The inherent risk in symbolism is that the symbol becomes a substitute for what it is meant to represent. The means becomes an end in itself, and the worship and devotion which the end requires, when devoted merely to the means, become a form of idolatry. . . (p. 37)

Gomes further illustrates how even the Bible can become an idol, or what he refers to as Bibiolatry, when the Bible is treated as the end of faith. When symbols are properly understood, there is always humility in the symbol that recognizes there is something more or something beyond the symbol.

Implications for Psychology and Psychotherapy

The God image and God concept are two psychological constructs developed that distinguish different aspects of religious or spiritual experience that have important implications for counseling and psychotherapy (Lawrence 1997; Moriarty 2006). The God concept is understood as the cognitive or theological understanding of God, whereas the God image represents the emotional experience of God. These are multifaceted constructs that typically include complex thoughts and emotions. For example, the God image is often inclusive of various concurrent emotions such as anxiety, warmth, fear, and appreciation rendering the experience of God as paradoxical if not internally contradictory. This complexity often has emotional consequences. Hoffman (2007, 2008) noted that the God image and God concept are rooted in psychological experience and not dependent upon the actual existence of God. Influenced by Tillich’s conceptions of the God beyond God, Hoffman maintained that direct experience of God or what one perceives to be God would be beyond the cognitive and theological ideas, and psychological experience, of God, which are subject to various distortions rooted in one’s history and experience.

In psychotherapy and counseling, the distinction between the God beyond God and one’s cognitive and emotional experience of God is particularly relevant for people with distorted, negative experiences of God (Moriarty 2006; Hoffman 2007, 2008). Hoffman et al. (2007) illustrate this with individuals from diverse backgrounds. For example, in the most influential Western religions, God is often represented as a White male with many characteristics of White heterosexual males projected upon God. This may impact the way women, people of color, and Lesbian, Gay, Bisexual, Transgender, and Queer (LGBTQ) individuals experience God. Although it could be argued that these Western religions see God, with the exception of Jesus, as beyond race, gender, and sexual orientation, the presentation of God is as if God were a White heterosexual male. Hoffman and colleagues state, “Although men are able to derive their value through being made in

God's image and through how they are similar to God, women are placed in the position of deriving their value through being different, the other, and dependent" (p. 270). The same would be true for people of color and LGBTQ individuals. According to Hoffman and colleagues, this biased reality contributes to a harmful, distorted experience of God that has negative implications for psychological health. The recognition of a God beyond God as presented in Western religion and thought provides an opportunity to heal wounds connected to distorted religious experience.

Conclusion

The God beyond God has a long history in theology. Through the work of Paul Tillich, the relevance of the God beyond God for psychology has been recognized. In essence, the God beyond God is rooted in the recognition that all knowledge and understanding of God is limited, and the experience of God is susceptible to distortion.

God Image

Bernard Spilka

Department of Psychology, University of Denver,
Denver, CO, USA

To the best of our knowledge in all cultures, supernatural beliefs occupy a central and extremely important place in the lives of the overwhelming majority of people. Apparently, only

scholars in Western societies have attempted to understand and study the beliefs, behaviors, and experiences of those who accept such views. A basic, apparently innate, feature of our mental apparatus is the formation of images of reference objects wherever possible. More specifically, research indicates that a probable genetic component is part of such religious systems (D'Onofrio et al. 1999). Though these do not explicitly identify God images as part of this complex, many scholars imply that they are part of such a mental framework (Ellis 2000).

Research in this area concerns two idea patterns: a descriptive set of images and certain cognitive and behavioral characteristics. Strictly speaking, God image refers to the former; the God concept is the latter. Concept also includes divine intentions and purposes. These generalizations have unclear limits. Hence, seriously overlap is present. Commonly, writers indiscriminately mix the two realms. Where relatively little study has been conducted on the images, most has been directed at God concepts for over a century. Certain widely employed terms seem to share both concept and image features. For example, God as male or God as Father brings to the fore physical and psychosocial traits. These also vary by age of the respondent (Harms 1944).

Attention to the gender of God really began with the woman's movement of the 1960s and appears to have stimulated a number of ingenious researches involving female development (Randour and Bondanza 1987), the differential influence of God language on the sexes (McMinn et al. 1993), and related considerations (Foster and Babcock 2001). God images have also been related to aspects of personality such as self-esteem and locus of control (Benson and Spilka 1973; Saussy 1991). The objective assessment of God image has also been attempted via the construction of an inventory (Lawrence 1996). Again, we encounter the problem of overlap between image and concept.

Another conceptual avenue that ties image and concept together derives from Freud (1928) and his psychoanalytic successors. Even though these ideas are popular, hypotheses about parental roots

have not always eventuated in God-father associations. This literature has also yielded God-mother and God-self imagery. Strong cultural influences obviously enter into and muddy this research.

A fine overview of research in the area up to 1977 is Pitts bibliography, the God concept in the child. More exacting but still inclusive of both realms is the work of Ladd et al. (1998) which deals with the God image drawings of almost 1,000 children.

Though a few projective image analyses stressing personality have been attempted, exacting, reliable treatments of God drawings are largely yet to be reported. Piedmont and Muller (2006) have, however, opened that door conceptually and methodologically. They tie God image to object relations psychodynamic theory and God concept to cognition. Though they appear to have derived many direct God image measures, these are not discussed in relation to their indices of God concept. Still, indirectly, they claim a moderate relationship between the two. This is an area that requires further conceptual clarification.

God Image and Therapy

Annette Peterson
Riverside, IL, USA

The God image, rich in myth and symbolism, is a door to the unconscious, providing a wealth of material for the psychotherapist. At face value, a client's God images reveal his or her relationship to transcendent reality and are a factor in psychological stability. By examining God images in depth, a therapist can symbolically interpret a client's religious projections as expressive of psychological needs. As a diagnostic tool, God image can be useful for therapy. Therapy can also help a client's God image by disabling a limiting God image or regulating an imbalanced God image.

The consideration of God image in therapy can help mental health professionals and their clients gain valuable insight into the client's inner psychological and relational world and can lead to improved intrapsychic and interpersonal functioning.

God images are strongly influenced by early parental relationships. Therefore, they have a vast therapeutic relevance and potential. God images can be explored for insight into a client's self-image and early relational environment.

God images can have a positive or negative psychospiritual function. Psychotherapy can draw upon the strength of a beneficial relationship with God or address negative, conflicting or one-sided God images in a variety of psychotherapeutic forums. It is important to work with the God image according to the client's particular relational matrix, developmental history, and level of psychic balance and integration.

Every person has internalized images of God that undergo developmental changes over the life course based on individual, cultural, and spiritual influences. Our God images are mirrors of ourselves. Clinical studies reveal that a person's experiences of God and self are related and mutually influential (Benson and Spilka 1973; Francis et al. 2001; Greenway et al. 2003). Therefore, it makes sense to use the God image in the psychotherapeutic effort to understand and improve the self.

The God image occupies a transitional space between the internal self and the external other. In this transitional space, God is both found and made. Martin Buber's *I and Thou* (1970) recognizes the relational space between self and other as a spiritual place, where God exists in "the between" of relationships, and seems to be at once both self and other.

In *Playing and Reality* (1971), Donald W. Winnicott implied that God could be seen as a transitional object that changes with a person's needs and desires. Winnicott's theory of transitional objects has become a core component of the object relations theory of God image. Winnicott advises the therapist to "play" with the client by joining in exploration of the intermediate space between reality and fantasy. Similarly,

Moshe Spero (1992) states the importance of being able to find a way to buy into a client's God image, thus preserving the therapeutic alliance and allowing God image to be a part of the treatment process and opening pathways to greater understanding of the God image and its psychic functioning.

Our relational expectations limit our experience of God and our ability to live full, balanced lives in harmony with our environment. By expanding our relational paradigms, therapy can alter God image without being an overt topic of treatment. The therapeutic relationship offers an affirming self-object function that is paramount to the success of therapy, resulting in a realignment of the personality's deep relational structure. In the course of treatment, the client's interaction with the therapist affects the client's other relationships. Due to the strong interdependence between the client's relationships with therapist, God image, and self-image, a successful treatment will improve all aspects of the client's relational matrix, including the God image, without direct focus on the God image.

Therapeutic methods that incorporate direct access and conscious exploration of God images can facilitate the process of psychospiritual insight and maturation. Interventions may seek to strengthen positive God images and improve or limit the damage done by negative God images. The current use of God image theory in psychotherapy is mostly focused on mitigating damage of negative God images, but it is also used in identifying and improving relational patterns – with others, self, and God.

God images can first be evaluated during psychotherapeutic assessment. “[C]areful exploration of the subjective description of an individual's God representation and the vicissitudes of the relationship with God may reveal precious information about the type of psychic and interpersonal events that led to the particular characteristics attributed to God. In this sense the God representation has the potential of a projective test” (Rizzuto 1991, p. 56).

Even if the relationship with God is not a presenting problem or an easily identifiable source of distress or impairment, ambivalent or

conflicting God images exact a psychic toll on the whole person. Strongly negative God images exacerbate psychological problems and inhibit recovery and therefore require clinical intervention. Healthy and helpful God images are a powerful source of psychological resilience and can be drawn upon to enhance coping and facilitate healing.

Psychotherapists can look for the source of God images in early parental relations, other significant relational experiences, religious history, and religious paradigms shared by the larger culture. God image, self-image, and world view are all developed in the context of our early relationships and continue to be mutually influential throughout the life course. The relationship between God image and the client's relational patterns can be explored in therapy for their mutual influence on a client's current relational functioning. Interpretive gains may be made “by concentrating on a person's felt bond with the sacred and conceptualizing that bond as a reflection of the inner object world and by listening through that bond for echoes of internalized affective patterns of relationship” (Jones 1991, p. 110).

The work of therapy often brings the client's adult understanding to attend to the repressions of his or her inner wounded child. Similarly, when images of God are openly discussed, a current mature understanding can shed light on past and present relationship with the divine. Therapist and client may identify multiple or conflicting God images that cause enduring psychospiritual conflict and/or distress. Conscious beliefs and unconscious expectations of God may collide. The damaging weight of repression and its dangerous backlash can result in an underlying suffering that is not understood. This may mean that early religious images and beliefs should be unearthed, even if a client believes they are irrelevant and no longer believes in them. Therapy can examine the implicit assumptions we have about God and facilitate greater balance and individuation.

The therapist invites the client to be curious about the psychological function and/or fallout of his or her God images. By taking a religious history and attending to religious associations, the therapist may identify a pattern of

psychodynamic motives. The God image can be used in the service of regression, progression, avoidance, resistance, companionship, or as an Oedipal object (Rizzuto 1993, pp. 27–29). The God image can be a link to a sense of divine mystery or an obstacle/false idol that prevents a healthy and helpful relationship to God. Disavowed God images may indicate the existence of restrictive or implausible God images that preclude the possibility of spiritual experience. Dysfunctional God images need to be examined and deconstructed to make room for healthy God images that are relational and dynamic, balanced, functional, and relevant.

God image therapy can take place in a religious or secular therapeutic environment. There are situational advantages to each, and both seek to promote self-reflection and insight, healing and development. People often take religious problems to religious counselors because they feel more understood by someone with a similar background or belief structure. When an insider may be too close to a problem, an outside perspective can be helpful. A secular therapist with no religious predispositions may offer a client more freedom for doubt and exploration.

Spiritual counselors have the unique benefit of clients who are interested in working directly on their relationship with God. Spiritual counseling and spiritual direction focus primarily on the client's relationship with God, whereas secular therapy will examine a client's inner psychic structure and ways of relating to God, self, and others. Both techniques will affect a client's God image and self-image by altering the client's sense of place and purpose in the world, as derived from his or her relation to God.

Mary Lou Randour notes, "But not all religious and spiritual experiences are God-centered, although I would argue that all are object relational" (Randour 1993, p. 4). Sometimes a client is faith-based or spiritual without being God-centered. In this case the client's object relations with spiritual reality or background of faith can be examined for the client's underlying existential safety net or for the conflicts or dilemmas that prevent its formation. In clinical cases where it is evident that the concept of God is a central

guiding cognitive structure, God images are clearly worth examining directly. However, focusing on religion in therapy could worsen emotional crises if a client has a strongly negative God image. Alternatively, if a parental interpretation of a client's relationship with God is felt as explaining away a deeply held religious belief, the clinical relationship could be jeopardized.

The respectful consideration of God image in therapeutic assessment and treatment requires the therapist to maintain neutrality and prevent his or her own beliefs from interfering with the client's. The therapist needs to inquire into the dynamic meanings of God images and conflicting images without attempting to modify religious ideation.

Spiritual and psychological experiences are linked because they share the goal of integration, the coming together of the fragmented self. Psychological and spiritual development can occur in tandem, mutually aiding or hampering each other. In therapy, as images of self, others, and God are examined, rethought, and rearranged, it becomes difficult to ascertain whether psychological health influences perceptions of the divine or vice versa. In some cases, increased self-acceptance permits the belief that God also cares, and a new sense of self demands a new God image to go with it (Jones 1991, pp. 73–85). In other cases, new possibilities for whom or what God is can loosen the hold of a judging, rejecting God image from early childhood that restricts adult development.

Commentary

Just like religion, the God image is neither good nor bad but depends on how it is used. It can be the source of problems or their solution. By recognizing what is helpful and harmful about our God images, therapy can work through psychological issues from our religion, improving relationships with God, others, and ourselves.

Some may question whether religious beliefs and/or spiritual practices are within the purview of the psychotherapist and may argue that God should be left in the hands of religious leaders. However, traditional religious instruction may not foster a progressive developmental direction and

can create a one-sided religious faith that results in psychological imbalance. Organized religion tends to resist a dynamic God image, preferring a stabilizing one. With its emphasis on goodness, religion can shame and vilify lesser impulses, exacerbating psychic rifts. Religion should not be an escape from the unconscious, seeking to focus on the good and repress the undesirable aspects of our psyches. At their best, religion and spirituality represent the culmination and completeness of life. Healthy God images are relational and dynamic, functional and mature, balanced and unified, and integrated and encompassing. These God images stabilize and perpetuate psychospiritual health and well-being.

A therapist's neutrality can aid a client in the exploration of his/her own beliefs, providing a therapeutic environment for rediscovering and strengthening or for questioning and reformulating the client's theological system. In any work with the God image, it is important to balance psychological attention to the God image with the spiritual reminder of God's transcendence of our understanding. Our God images are not God, but they mediate our ability to experience and relate to divine reality. "Much can be learned from our particular route to or away from God, from our projected images, as well as about the God we let reach us through our projections" (Ulanov 2001, p. 105).

God Image in Dreams

Annette Peterson
Riverside, IL, USA

Dream characters and images are reflections of ourselves and our images of God.

Sleep gives the brain the opportunity to process and store information from the day. It also provides the opportunity to anticipate the future and practice behavior and decision-making in a variety of contexts.

According to Freud, dreams provide wish fulfillment of impulses left over from conscious waking life. Freud wrote that dream material is based in "residues of daytime life. . .struggle for expression during the night" (Freud 1965, p. 593). These residual impulses come from what we have failed

to deal with consciously, due to circumstance, our own limitations of capacity or capability, or our unconscious struggles that are rejected or suppressed in the daytime.

God images, like self-images, are ubiquitous in the form and frequency they take in dreams. The dreamer may encounter a dream character, object, or place that evokes the sublime, an experience of awe, or a sudden epiphany of peace or understanding. God may be directly called upon in dreams, with miraculous results.

Dream images of a cosmic struggle between good and evil reflect internal discord and existential fear. In nightmares, dreamers frequently report being pursued by an evil person or entity, bent on hurting or destroying the dreamer. Although the dream image may be that of an anti-God, or demonic figure, the dream content is still religious in essence, in that it seeks to come to terms with our unconscious demons and the presence of evil in the world.

In psychotherapy, dream images are examined and interpreted for symbolic significance and the thoughts and feelings they evoke. Cultural archetypes are explored for personal resonance. Scriptural parallels may be discussed. Connections are drawn to the present context in order to widen the client's understanding and deepen the personal meaning of his or her God images. When the dream image is considered in light of the client's present situation, client and therapist become aware of significant patterns or underlying conflicts that can now be consciously explored.

Frequently, clients report dreams in which they felt surprised by God. Some dream material did not reflect the client's conscious God images, and they felt disturbed enough to bring the dream into therapy. The dream image can provide the opportunity for the examination and expansion of consciously held God images, furthering the developmental maturation of the client's God images.

Commentary

Dreaming "changes the channel" of our particular everyday reality; therefore, dreaming expands our

personal horizons and may even be practice for death and what may exist beyond this life.

Goddess Spirituality

Mara Lynn Keller
California Institute of Integral Studies, San
Francisco, CA, USA

Goddess spirituality is the reverential experiencing and expressing of divine female energies within the universe. It emerged among our early human ancestors in Africa during the Paleolithic Age, and it continues to the present in societies around the world, because it meets profound needs in the psycho-spiritual life of adherents.

Goddess spirituality played a major role in the Neolithic Age with its agrarian revolution and emphasis on the fertility of the Earth, perceived as Great Mother, Bearer of all Life. Artemis of Ephesus is a late expression of this Goddess, here wearing a necklace of zodiac signs and costume of sacred animals, bees, and flowers. Votaries called her Great, Magnificent, Queen, Commander, Guide, Advisor, Legislator, Spreader of Light, Savior, and Controller of Fate (Fig. 1).

Goddess Spirituality, Fig. 1 Artemis, Goddess of Ephesus, many-breasted Mother of Heaven and Earth, Mistress of Animals, wearing necklace of zodiac signs and costume of sacred animals, bees, and flowers. Votaries called her “Great, Magnificent, Queen, Commander, Guide, Advisor, Legislator, Spreader of Light, Savior, and Controller of Fate.” Ephesus Archaeological Museum, Selçuk, Turkey. (Photo courtesy of Diane L. Martin (2001))

This kind of multi-faceted Great Goddess continued to be worshipped into the Bronze and Iron Ages, although Goddesses generally became subordinated by male-dominant societies that worshipped male Gods as supreme. Goddess spirituality has persisted in most indigenous cultures of Africa, Europe, Asia, and the Americas. But the male-oriented monotheistic Abrahamic religions of Judaism, Christianity, and Islam have extensively suppressed Goddess spirituality in regions they came to dominate, due to superior military might and sometimes through brutal tactics such as the witch persecutions in medieval and early modern Europe, in the Christianized Americas, and in Africa.

How is it that humans can imagine, feel, and relate spiritually to a Goddess as symbol, metaphor, psycho-spiritual energy, cosmic and ontological reality? For much of human history, people believed they were created by deities and so invoked their powers and gifts through religious rites. Modern secular psychologies and philosophies have reversed the causal relationship by claiming that humans created deities – as the “projections” of human ideals (Feuerbach), “wish fulfillment” (Freud), or the “opiate of the masses” (Marx). Yet, the epidemics of violence, despair, and apathy afflicting even the young in contemporary cultures point to the emotional and spiritual need of individuals to find a spiritual and moral compass and to celebrate aspects of life that offer love, companionship, family, health, well-being, community, ecological balance, and purpose. Goddess spirituality offers these benefits through the prism of divine feminine energies, energies of the cosmos that generate female beings and the capacity to bear and nurture female and male offspring.

Goddess traditions around the world have guided persons transiting the most intensely intimate passages in the human life cycle – birth, sexual initiation, procreation, disease and death, and the prospect of rebirth. Goddess religion (like other religions) prescribes rules and regulations regarding the everyday necessities of food and nurture, survival, and healthcare. It provides answers for perennial questions about the meaning of life, our place within the cosmos, and our relationship to the Source of all being and becoming. Sacred stories and myths about Goddesses portray their interactions with humans, giving divine meaning and inspiration to key life experiences. Generally, Goddesses and their priestesses provide archetypal energies and role models for women and girls, while Gods and priests provide archetypal energies and role models for men and boys. However, many scholars argue that evidence shows that Goddesses sometimes presided over whole cities and civilizations and were worshipped as the primary deity by men and women alike (e.g., in Anatolia, Crete, Old Europe, India, Japan, Hawaii, Brazil, and numerous North American Indian tribes) (Allen 1991; Biaggi

2005; Gimbutas 1991; Goettner-Abendroth 2009, 2012; Monaghan 1981, 2011).

Beginning in the 1970s in the United States and Europe, there rose a great popular returning toward the Sacred Feminine, mostly but not exclusively by women – in Goddess circles, neo-pagan groups, scholarly studies, and the arts – as a way to access the psycho-spiritual and political empowerment that accompanies the affirmation of the Divine as female. Mary Daly's work *Beyond God the Father* (1973) catalyzed the desire of many women in the North/West to come to terms with the male centeredness of the religions in which they had been raised. Marija Gimbutas' archaeological study of *Goddesses and Gods of Old Europe* (1974/1982) and her subsequent books provided a window into Neolithic European societies that worshipped a Goddess or Goddesses of birth and nurture, death, and regeneration as their primary deity – as immanent within the procreation of all life, a transcendent principle of the cosmos, and sometimes accompanied by a stimulating and fructifying Sacred Male God. A sharp debate continues in academia about the significance of Gimbutas's discovery of a "Goddess Civilization" in Old Europe and her groundbreaking interdisciplinary archaeomythological methodology (archaeology, linguistics, mythology, and folklore) for interpreting ancient religious symbolism (Spretnak 2011).

In 1975, 1800 women attended the first women's spirituality conference in Boston. Ntozake Shange's 1976 Broadway play, *for colored girls who have considered suicide /when the rainbow is enuf*, dramatized women's embrace of a female God for the sake of survival and strength, with the exuberant exclamation, "I found God in myself and I loved her fiercely!" Also in 1976, Merlin Stone gathered scattered fragments of evidence for ancient Goddess worship, *When God Was a Woman*, tracing changes in religious symbolism from matristic or mother-centered cultures to patriarchal father-centered cultures. Stone relied on archaeological studies such as those of James Mellaart at Çatalhöyük and Arthur Evans at Knossos, Crete; and ancient literatures such as the *Enuma Elish*, the Babylonian myth of the primordial Goddess Tiamat being defeated by the young

God Marduk, and the account in *Genesis* 3 of the Hebrew Bible of Adam and Eve in the Garden of Eden, where the snake in the tree is interpreted as representing knowledge of the early Goddess-centered culture being rejected by promulgators of the new Yahweh-only religion, with the cultural shift during the Bronze Age toward patriarchy and male dominance. In 1978, Charlene Spretnak published *Lost Goddesses of Early Greece*, reconstructing the Hellenic Goddess myths from a pre-Olympian, pre-patriarchal point of view, portraying Greek Goddess archetypal qualities free from androcratic distortions.

At the conference on "The Great Goddess Re-Emerging" at the University of California at Santa Cruz in the spring of 1978, Carol P. Christ delivered the keynote address, "Why Women Need the Goddess: Phenomenological, Psychological, and Political Reflections." Christ proposed four compelling reasons why women might turn to the Goddess: the affirmation and legitimation of female power as beneficent, affirmation of the female body and its life cycles, affirmation of women's will, and affirmation of women's bonds with one another and of positive female heritage (Christ 1979).

Present-day Goddess priestesses began creating community rituals and publishing books about how to create personal and communal ceremonies that invoke the Goddesses: Z Budapest, Starhawk, Luisah Teish, and the antinuclear activist women of Greenham Common in England. In 1987 Monica Sjoo and Barbara Mor produced *Great Cosmic Mother: Rediscovering the Religion of the Earth*. Many Goddess spirituality activists and authors emphasize that the multicultural women's spirituality movement is not an escape from political engagement with urgent social and environmental issues, as critics argue, but a way to connect with them in deeply personal and powerful ways.

Building on earlier Goddess studies by Arthur Evans, Jane Ellen Harrison, G. Rachel Levy, Martin P. Nilsson, Robert Graves, Eric Neumann, Carl Kerényi, N. N. Bhattacharyya, and others, many feminist scholars formed powerful arguments for the existence of pre-patriarchal Goddess-

Goddess Spirituality, Fig. 2 Demeter, Persephone, and Ploutos (Plenty) sharing the gift of grain for feeding humanity, from the Eleusinian Mysteries that celebrated the birth, sacred marriage, death, and rebirth of all life. Pentelic marble relief. Eleusis, Greece. c. 440–430 BCE Metropolitan Museum of Art, New York. Public Domain. This figure is licensed under the GNU Free Documentation License, Version 1.2. <http://en.wikipedia.org/wiki/File:Eleusis2.jpg>

worshipping cultures that had been subsumed by male-dominant cultures: Riane Eisler, Patricia Monaghan, Gerda Lerner, Elinor Gadon, Paula Gunn Allen, Mara Lynn Keller, Anne Baring and Jules Cashford, Asphodel Long, Cristina Biaggi, Lucia Chiavola Birnbaum, and Max Dashu. A deep and rich history of Goddesses was being resurrected. For example, the myth and ritual of Demeter and Persephone in Greece comprised a popular mystery religion celebrating the birth, sacred marriage, death, and rebirth of all life; it is again infusing seasonal Goddess rituals with its affirmation of the mother-daughter bond and its sense of the kinship of all beings (Fig. 2).

Inspired by Goddess spirituality's embodied sense of self, nature, and cosmos, many artists created paintings, poetry, songs, novels, and films about Goddesses, such as Judith Anderson, Jennifer Berezan, Susan Seddon Boulet, Janine Canan, Meinrad Craighead, Rose Wognum Frances, Tricia Grame, Vijali Hamilton, Sue Monk Kidd, Audre Lorde, Mary Mackey, Alexis Masters, Burleigh Muten, Mayumi Oda, Donna Read, and Lydia Ruyle. Some curated Goddess art exhibits or published magazines, encyclopedias, or beautiful collections of Goddess scriptures and sacred art. Others made pilgrimages to ancient Goddess sites or devoted themselves to Goddess avatars. More and more Jewish and Christian women explored the feminine aspect of God and invoked the Feminine Divine and Sophia/Holy Wisdom.

In ancient cultures, religion and psychology were conjoined. The Greek word *psyche* means *spirit* and *soul*. The ancients conceived of Spirit as a dynamic life force or essence manifest in particular material forms, including male, female, and androgyne genders. In the modern era in North/West sectors of the globe, psychology has to some extent supplanted religion, addressing the emotional well-being of individuals who in many cases no longer (or never did) turn to religion for sustenance, solace, or significance. Freud's secular approach to psychology was countered by Jung's spiritual approach called archetypal psychology, which named *sacred feminine* and *sacred masculine* aspects of the human psyche and theorized that both were to be found in individual women and men – undercutting the extreme dualism of masculine vs. feminine entrenched in European and Euro-American societies. While acknowledging the valuable contributions these two fathers of psychology made to a deeper understanding of modern human emotions and behaviors, feminist psychologists critiqued the patriarchal bias in both theorists. Others criticized the use of notions of gender altogether.

Goddess spirituality can be understood psychologically in the concepts of conscious and unconscious gestalts that result from personal experience, family interrelationships, and

transpersonal constellations of behaviors as mother, father, daughter, son, spouse, lover, healer, oracle, wise elder, etc. Archetypal energies may have been repressed from conscious memory but remain encoded in psycho-spiritual patterns, having profound influences on the choices of one's day-to-day life. Many spiritual feminist psychologists, including Jean Shinoda Bolen, Kathie Carlson, Virginia Beane Rutter, and Tanya Wilkinson, build on the work of Jung, using mythic archetypes of the ancient Goddesses to assist contemporary women in developing a deeper sense of self, spirituality, and fulfillment.

Key themes debated within *Goddess theology* reflect the psychological, religious, and political diversity among Goddess-spirituality people. Is the Goddess one and/or many? Is she immanent and/or transcendent? Is she only of the female gender, bi- or multi-gendered, and/or beyond gender? Is she metaphor, symbol, and/or reality? Is she anthropomorphic (having human form), therianthropic (having animal-human form), and/or aniconic (without an image)? Is she knowable and/or mysterious and ineffable? Is she all-inclusive (encompassing good and evil, sacred, and profane) or all-good? Is Goddess spirituality political or apolitical? Many Goddess devotees hold a *both-and* epistemology that accepts (linguistic) contradictions and embraces the paradoxical nature of the Female Divine with her multiplicity of attributes and unitary Oneness. This inclusive and pluralistic understanding offers complexity and expansiveness, affirming diversity as limitless as nature itself and seeing humans embedded within the Great Mysteries of life.

The tremendous resurgence today of Goddess spirituality has grown in tandem with the worldwide women's liberation movement. Both seek to meet the material and psychological needs of peoples and the planet to redress the over-masculinization of cultures and associated fundamentalist patriarchal religions, stresses, and devastations from overly aggressive ways of life. This is reflected in mass phenomena such as devotional festivals to Goddesses attended by millions in India or Brazil, the globally popular movie *Avatar* with its Earth Goddess-centered spirituality, and

the best-selling Dan Brown novel *The Da Vinci Code* with its themes of the Christian Church's suppression of the Sacred Feminine and the Sacred Marriage, and the irrepressible yearning for their return.

Despite ongoing efforts by androcentric and thea-phobic religious traditions and sectors of academia to denigrate or deny Goddess spirituality, it continues to blossom in Goddess Studies (notably at the California Institute of Integral Studies in San Francisco), Goddess conferences (the Association for the Study of Women and Mythology), Goddess-related journals (*Goddess Theology Journal*, *OCHRE Journal of Women's Spirituality*, *Journal of Archaeomythology*), and the closely related field of Matriarchal Studies, advanced by Heidi Goettner-Abendroth and Peggy Reeves Sanday, that documents matriarchal cultures where Goddess spirituality has persisted through millennia. All this affirms the continuing presence of the Goddess in the hearts and minds of millions of adherents around the world.

Golden Bough, The

Lee W. Bailey

Department of Philosophy and Religion, Ithaca College, Ithaca, NY, USA

James G. Frazer

The Golden Bough: A Study in Magic and Religion, written by the Scottish anthropologist and classicist James George Frazer (1854–1941) at Cambridge University, was a culminating comparative study of world religions seen through the eyes of major themes in nineteenth-century European scholarship. Macmillan published it in two volumes in 1890, in three volumes in 1900, and expanded it in the third edition into 12 volumes by 1915. Due to its wide popularity, a one-volume condensation has been published since 1922. Frazer's originality is that no one before him had ever dug up so many of the "primitive" elements of the religions of Greece, Rome, and the eastern Mediterranean. More boldly, he first compared these on a global scale with the religions of "savages." His work was part of the Enlightenment project of studying one religion not as self-evidently true, but as one of many religions uncovered since the world expanded after Columbus. From the start, *The Golden Bough* was generally a critical and popular success, yet it expressed the sunset of the confident European speculative, imperialistic view of superiority over earlier world cultures. The Greek and Roman classics, long the core of European education, were soon dethroned and world cultures were slowly admitted to the academy via anthropology.

The title "Golden Bough" is taken from the small evergreen plant mistletoe, which, when dried, turns a golden color. It seemed magical to ancients because it grows on the branches of other trees, high above the ground, green when the host tree is bare in winter. Its seeds are carried from tree to tree by birds and grow as parasites on the branches of larger trees. According to classical

authors such as Pliny and Virgil, mistletoe, believed to hold divine fire sent from the gods by lightning, was carried by Aeneas to the underworld and was cut from oak trees with a golden blade by Druid priests for magical purposes (Frazer 1922, Chap. 68).

Science and Primitives

The Golden Bough is a leading exponent of the naturalist, empiricist, skeptical philosophy of the Enlightenment, led in Scotland by David Hume. Its avowed purpose is to treat religion in a "scientific" way, seeing it as part of the evolutionary view of the crude, ignorant savage society over the centuries evolving into an enlightened rational Victorian culture. In a positivist fashion, Frazer reduced religion to a kind of deluded intellectual speculation, but he was often really doing psychology, as when he saw terrified fear leading even to bloody sacrifices as major motives for magic and religion (Frazer 1922, p. 111). This was unlike others, such as William Robertson Smith, who saw in religion the work of more benevolent emotions, such as love and gratitude (Smith 1889/2002). Frazer sought evidence for the emotions and motives of ancient prehistorical peoples, and his psychology was rather individualistic rather than social. In nineteenth-century fashion, Frazer assumed the heroic great-man principle of historical change. He assumed that humans seek primarily to control nature and have, throughout history, tried three major methods.

Frazer's cultural development scheme has three stages: magic, religion, and science. Each was essentially an intellectual system, the first two clumsy and superstitious and the last triumphant. But evolutionary theory dictated that each corrected some errors and built on other surviving elements of the earlier one, notably the annual quest to assure the continuing fertility of life. The *magical* cultures, which Frazer thought were illustrated by the Australian Aborigine cultures, he proposed, evolved elsewhere into *religious* cultures, characterized by gods and goddesses.

This was not enough, however, for as each system's flaws in dealing with nature and society emerged, *science* was bound to replace the earlier, outdated systems (Frazer 1922, Chap. 69).

The colonialist reports of global indigenous cultures brought back to Europe gripping accounts of practices and beliefs that challenged Western cultural assumptions and stimulated many scholars like Frazer to seek to explain these strange cultures to a fascinated audience, condescending to relegate the stranger customs to an inferior, barbaric position, a "low mental stratum" (Frazer 1922, p. 64). Frazer's Victorian goal was to explain how "primitives," desperately seeking food, health and security, terrified of death, childbirth, and destructive weather, badly misunderstood the world. The logic of religious evolution in this schema is not valid, however. The priest and ethnologist Wilhelm Schmidt (1868–1954) argued that religion was earlier in evolution than magic, and he saw in primordial high gods the seeds of monotheism (Schmidt 1926/1935). And today, amid a largely scientific culture, we see hints of "survivals" of magic in rituals such as video games, the continuation of religion in mega-churches, and new age spiritual developments. And even behind the intellectual principles of science, we can find psychological roots, such as the belief in domination over nature, that have led to the ecology crisis. As we are seeing in the effects of global warming, one-sided industrial "progress" was blindsided by the neglected environmental factors that are now biting back. Frazer's view that the purpose of these three systems is to dominate nature is flawed; while magic and science may seek this goal, religion has other purposes, such as ethics, morality, social cohesion, refining instincts, and beliefs about life after death.

Early anthropologists like Frazer called their method of comparative religion "scientific," meaning a neutral approach to religions not favoring their Christianity, and the method of hypothesis-testing with empirical data. But, by later standards, their early efforts at applying scientific principles to religion, and its social and psychological meanings found in global societies,

were sloppy. Frazer's idea of the comparative study of religion was to make wild leaps to similar practices in other cultures around the world, but without carefully examining the cultural contexts that might have shown a different interpretation. Plus, his theories were not always consistent. He waffled on the question of whether ritual precedes myth and the question whether myths are diffused from one source or spontaneously arise in many locales. But his themes were captivating, as belief in "progress" peaked before World War I's devastations.

His encyclopedic collection of "savage" practices, blended with accounts from classical literature, was pulled together in a grand theory that followed in the tradition of comparative religion. This method of comparing the religions of different cultures was as old as Herodotus' (c. 484–c. 424 BCE) *Histories*, where he compared the Egyptian and Greek religions, arguing that the Greeks had borrowed many Egyptian religious themes (Herodotus 1954, pp. 116–135). After Columbus, this method exploded as local doctrines lost their certainty, and by the nineteenth century, grand theories of comparative religion had developed, such as those of Tylor, Müller, and Mannhardt.

Edward Tylor (1832–1917) developed comparative anthropology along the lines of a theory of a cultural evolution, "animism," or the belief in soul in nature. He also assumed the idea of "survivals" of archaic practices still present in tribal cultures and the global uniformity of human nature. He explored the question of cultural diffusion versus independent origins of similar themes. He viewed myths as crude efforts at reasoning, rather than symbolic expressions, and tried to extract historical nuggets from their narratives (Tylor 1994). Frazer adopted these general themes.

Max Müller (1823–1900) virtually created the newer discipline of comparative religion, aided by his remarkable 50-volume collection of translations of *Sacred Books of the East*. He stressed philology or a linguistic basis for comparative religion, showing how the words for common things such as numbers were very similar from India to Europe. For example, he says that word

for “one” in Sanskrit is “*ekas*,” in Greek “*eis*,” and in Gothic “ains” (Müller 1869, Vol. 1, p. 51). He interpreted myths and religions as personifications of natural forces, especially the sun (Müller 2002). Frazer’s version of comparative religion was not linguistic, but rather focused on rituals, followed by myths, that he saw as intellectual, rather than symbolic, and euhemeristic, or revealing factual historical events, rather than psychological. Both of the latter are largely flawed assumptions.

Wilhelm Mannhart (1831–1880) was a folklorist who studied archaic tree and grain cults whose indwelling spirits (*korndämonen*) had to be annually helped in producing fertility by magical and religious practices, which was a key theme adopted by Frazer (Mannhardt 1868/1978).

The general shift in the academic effort to understand world religions was away from the dogmatic, exclusivist certainties of familiar faiths and toward evolutionary theories and sociological analysis. Today, we view these theories as early, hasty generalizations of “armchair” anthropologists, rather than the careful field studies characteristic of current anthropology. Indeed, the overzealous generalizations of these Victorian theorists, while popular, stimulated twentieth-century anthropologists such as Franz Boas (1858–1942), although friendly with Frazer, to reject hasty, broad generalizations in favor of living among the people he studied and limiting his theories to the cautious boundaries of observed societies (Boas 1994). In view of such critiques, we see today that the themes explored in Frazer’s work still have some explanatory value, but not the universal implications that he proclaimed.

Blood and Fertility

From his chair at Cambridge, Frazer mused over a riddle that had long fascinated classical scholars. The Greek geographer Strabo told of a temple near Rome where a runaway slave who killed the former priest-king became the next priest-king. Macaulay’s poem “the Battle of Lake Regillus” tells the riddle:

From the still glassy lake that sleeps
Beneath Aricia’s trees –
Those trees in whose grim shadow
The ghastly priest doth reign,
The priest who slew the slayer,
And shall himself be slain – (Fraser 1990, p. 33).

Frazer devoted most of his life to collecting parallels from travelers, mentally leapfrogging around the world, seeking to make sense of this nugget of mystery. His theory turned into a major popular epic that concluded the Victorian era’s bold but reckless efforts to sweep world religions into a single dustbin of superstitions that fall before the powers of science. Nevertheless, this kind of work was a beginning for the study of world religions with a neutral eye.
